In Sweden, P. Bjerre, successor to Wetterstand, has, at least temporarily, given up hypnotic suggestion in favor of analytic treatment. A. Vogt (Christiania) honored psychoanalysis already in 1907 in his “Psykiatriens gruntraek,” so that the first text-book on psychiatry that took any notice of psychoanalysis was written in Norwegian. In Russia, psychoanalysis is very generally known and widespread; almost all my writings as well as those of other advocates of analysis are translated into Russian. But a deeper grasp of the analytic teaching has not yet shown itself in Russia. The contributions written by Russian physicians and psychiatrists are not at present noteworthy. Only Odessa possesses a trained psychoanalyst in the person of M. Wulff. The introduction of psychoanalysis into the science and literature of Poland is due chiefly to the endeavors of L. Jekels. Hungary, geographically so near to Austria, scientifically so foreign to it, has given to psychoanalysis only one co-worker, S. Ferenczi, but such an one as is worth a whole society.

The standing of psychoanalysis in Germany can be described in no other way than to state that it is the cynosure of all scientific discussion, and evokes from physicians as well as from the laity, opinions of decided rejection, which, so far, have not come to an end, but which, on the contrary, are constantly renewed and strengthened. No official seat of learning has, so far, admitted psychoanalysis. Successful practitioners who apply it are few. Only a few institutions, such as that of Binswanger’s in Kreuzlingen (on Swiss soil) and Marcinowski’s in Holstein, have opened their doors to psychoanalysis. In the critical city of Berlin, we have K. Abraham, one of the most prominent representatives of psychoanalysis. He was formerly an assistant of Bleuler. One might wonder that this state of things has thus continued for a number of years without any change, if it was not known that the above account merely describes the superficial appearances. One must not overestimate the significance of the rejection of psychoanalysis by the official representatives of science, the heads of institutions, as well as their young following. It is easy to understand why the opponents loudly raise their voices whilst the followers, being intimidated, keep silent. Many of the latter, whose first contributions to analysis raised high expectations, later withdrew from the movement under the pressure of circumstances. But the movement itself strides ahead quietly. It is always gaining new supporters among psychiatrists and the laity. It constantly increases the number of readers of psychoanalytic

literature and thus forces the opponents to a more violent attempt at defense. In the course of these years I have read, perhaps a dozen times, in the reports of the transactions of certain congresses and of meetings of scientific societies, or in reviews of certain publications, that psychoanalysis was now dead, that it was finally overcome and settled. The answer to all this would have to read like the telegram from Mark Twain to the newspaper that falsely announced his death: “The report of my death is grossly exaggerated.” After each of these death-notices, psychoanalysis has gained new followers and co-workers and has created for itself new organs. Surely to be reported dead is an advance over being treated with dead silence!

Hand in hand with its territorial expansion just described psychoanalysis became enlarged with regard to its contents through its encroaching upon fields of knowledge outside of the study of the neuroses and psychiatry. I will not treat in detail the development of this part of our branch of science since this was excellently done by Rank and Sachs (in Löwenfeld’s “Grenzfragen”) which presents exhaustively just these achievements in the work of analysis. Besides, here everything is in inchoate form, hardly worked out, mostly only preliminary and sometimes only in the stage of an intention. Every honest thinker will find herein no grounds for reproach. There is a tremendous amount of problems for a small number of workers whose chief activity lies elsewhere, who are obliged to attack the special problems of the new science with only amateurish preparation. These workers hailing from the psychoanalytic field make no secret of their dilettantism, they only desire to be guides and temporary occupants of the places of those specialists to whom they recommend the analytic technique and principles until the latter are ready to take up this work themselves. That the results aimed at are, even now, not at all insignificant, is due partly to the fruitfulness of the psychoanalytic method, and partly to the circumstance that already there are a few investigators, who, with out being physicians, have made the application of psychoanalysis to the mental sciences their lifework.

Most of these psychoanalytic applications can be traced, as is easily understood, to the impetus given by my early analytic works. The analytic examinations of nervous patients and neurotic manifestations of normal persons drove me to the assumption of psychological relationships which, most certainly, could not be limited only to that field. Thus analysis

presented us not only with the explanation of pathological occurrences, but also showed us their connection with normal psychic life and uncovered undreamed-of relations between psychiatry and a variety of other sciences dealing with activities of mind. Thus certain typical dreams furnished the understanding of many myths and fairy tales. Riklin and Abraham followed this hint and began those investigations about myths which have found their completion in the works of Rank on Mythology, works which do full justice to all the requirements of the specialist. The prosecution of dream-symbology led to the very heart of the problems of mythology, folk-lore (Jones, Storfer) and of religious abstraction. At one of the psychoanalytic congresses the audience was deeply impressed when a student of Jung pointed out the similarity of the phantasy-formation of schizophrenics with the cosmogonies of primitive times and peoples. In a later elaboration, no longer free from objection yet very interesting, Jung made use of mythological material in an attempt to harmonize the neurotic with religious and mythological phantasies.

Another path led from the investigation of dreams to the analysis of poetic creations, and finally to the analysis of authors and artists themselves. Very soon it was discovered that the dreams invented by writers stand in the same relation to analysis as do genuine dreams. The conception of the unconscious psychic activity enabled us to get the first glimpse into the nature of the poetic creativeness. The valuation of the emotional feelings which we were forced to recognize while studying the neuroses enabled us to recognize the sources of artistic productions and brought up the problem as to how the artist reacts to those stimuli and with what means he disguises his reactions. Most psychoanalysts with wide interests have furnished contributions from their works for the treatment of these problems, which are among the most attractive in the application of psychoanalysis. Naturally here also opposition was not lacking from those who are not acquainted with analysis, and expressed itself with the same lack of understanding and passionate rejection as on the native soil of psychoanalysis. For it was to be expected as a matter of course, that everywhere psychoanalysis penetrates, it would have to go through the same struggle with the natives. However, these attempted invasions have not yet stirred up interest in all fields which will, in the future, be open to them. Among the strictly scientific applications of analysis to literature the deep work of Rank on the theme of incest easily ranks first. Its content

is certain to evoke the greatest unpopularity. Philological and historical works on the basis of psychoanalysis are few, at present. I myself dared to venture to make the first attempt into the problems of the psychology of religion in 1910, when I compared religious ceremonials with neurotic ceremonials. In his work on the "piety of the Count of Zinzendorf," as well as in other contributions, the Rev. Dr. Pfister, of Zürich, has succeeded in tracing back religious zealotism to perverse eroticism. In the recent works of the Zürich School one is more likely to find that religion becomes injected into the analysis rather than rationally explained by it.

In my four essays on "Totem and Taboo" I made the attempt to discuss the problems of race psychology by means of analysis. This should lead us directly to the origins of the most important institutions of our civilization, such as state regulations, morality, religion, as well as to the origins of the interdiction of incest and of conscience. To what extent the relations thus obtained will be proof to criticism cannot be determined today.

My book on Wit furnished the first examples of the application of analytic thinking to esthetic themes. Everything else is still waiting for workers, who can expect a rich harvest in this very field. We are lacking here in workers from these respective specialties and in order to attract such, Hans Sachs founded in 1912, the journal Imago, edited by himself and Rank. Hitschmann and v. Winterstein made a beginning with the psychoanalytic elucidation of philosophical systems and personalities. The continuation and deeper treatment of the same is much to be desired.

The revolutionary findings of psychoanalysis concerning the psychic life of the child, the part played therein by sexual impulses (v. Hug-Helmuth) and the fate of such participation of sexuality which becomes useless for the purpose of propagation, naturally drew attention to pedagogics, and instigated the effort to push the analytical viewpoint into the foreground of this sphere. Recognition is due to the Rev. Pfister for having begun this application of analysis with honest enthusiasm, and for having brought it to the notice of ministers and educators. He succeeded in winning over a number of Swiss pedagogues as sympathizers in this work. It is said that some preferred to remain circumspectly in the background. A portion of the Vienna analysts seem to have landed in their retreat from psychoanalysis on a sort of medical pedagogy. (Adler and Furtmüller, "Heilen and Bilden," 1913.)

I have attempted in these incomplete suggestions to indicate the, as yet, hardly visible wealth of associations which have sprung up between medical psychoanalysis and other fields of science. There is material for the work of a whole generation of investigators and I doubt not that this work will be done when once the resistance to psychoanalysis as such has been overcome.

To write the history of the resistances, I consider, at present, both fruitless and inopportune. It would not be very glorious for the scientific men of our day. But I will add at once that it has never occurred to me to rail against the opponents of psychoanalysis merely because they were opponents, not counting a few unworthy individuals, fortune hunters and plunderers such as in time of war are always found on both sides. For I knew how to account for the behavior of these opponents and had besides discovered that psychoanalysis brings to light the worst in every man. But I decided not to answer my opponents and, so far as I had influence, to keep others from polemics. The value of public or literary discussions seemed to me very doubtful under the particular conditions in which the fight over psychoanalysis took place. The value of majorities at congresses or society meetings was certainly doubtful, and my confidence in the honesty and distinction of my opponents was always slight. Observation shows that only very few persons are capable of remaining polite, not to speak of objective, in any scientific dispute, and the impression gained from a scientific quarrel was always a horror to me. Perhaps this attitude of mine has been misunderstood, perhaps I have been considered as good-natured or so intimidated that it was supposed no further consideration need be shown me.

This is a mistake. I can revile and rave as well as any other, but I am not able to render into literary form the expressions of the underlying affects and therefore I prefer to abstain entirely.

Perhaps in many respects it might have been better had I permitted free vent to my own passions and to those about me. We have all heard the interesting attempt at an explanation of the origin of psychoanalysis from its Viennese milieu. Janet did not scorn to make use of it as late as 1913, although, no doubt, he is proud of being a Parisian. This *aperçu* says that psychoanalysis, especially the assertion that the neuroses can be traced back to disturbances in the sexual life, could only have originated in a city like Vienna, in an atmosphere of sensuality and immorality not to be found

in other cities, and that it thus represents only a reflection, the theoretical projection as it were, of these particular Viennese conditions. Well, I certainly am no local patriot, but this theory has always seemed to be especially nonsensical, so nonsensical that sometimes I was inclined to assume that the reproaching of the Vienna spirit was only a euphemistic substitution for another one which one did not care to bring up publicly. If the assumptions had been of the opposite kind, we might be inclined to listen. But even if we assume that there might be a city whose inhabitants have imposed upon themselves special sexual restrictions and at the same time show a peculiar tendency to severe neurotic maladies, then such a town might well furnish the soil on which some observer might get the idea of connecting these two facts and of deducting the one from the other. But neither assumption fits Vienna. The Viennese are neither more abstemious nor yet more nervous than dwellers in any other metropolis. Sex matters are a little freer, prudishness is less than in the cities of western and northern Europe that are so proud of their chastity. Our supposed observer would, more likely, be led astray by the particular conditions prevailing in Vienna than be enlightened as to the cause of the neuroses.

But Vienna has done everything possible to deny her share in the origin of psychoanalysis. Nowhere else is the inimical indifference of the learned and cultured circles so clearly evident to the psychoanalyst.

Perhaps I am somewhat to blame for this by my policy of avoiding widespread publicity. If I had caused psychoanalysis to occupy the medical societies of Vienna with noisy sessions, with an unloading of all passions, wherein all reproaches and invectives carried on the tongue or in the mind would have been expressed, then perhaps the ban against psychoanalysis might, by now, have been removed and its standing no longer might have been that of a stranger in its native city. As it is, the poet may be right when he makes Wallenstein say:

“Yet this the Viennese will not forgive me,
That I did them out of a spectacle.”

The task to which I am unequal, namely, that of reproaching the opponents “suaviter in modo” for their injustice and arbitrariness, was taken up by Bleuler in 1911 and carried out in most honorable fashion in

his work, “Freud’s Psychoanalysis: a Defense and a Criticism.” It would be so entirely natural for me to praise this work, critical in two directions, that I hasten to tell what there is in it I object to. This work appears to me to be still very partisan, too lenient to the mistakes of our opponents, and altogether too severe to the shortcomings of our followers. This characterization of it may explain why the opinion of a psychiatrist of such high standing, of such indubitable ability and independence, has not had greater influence on his colleagues. The author of “Affectivity” (1906) must not be surprised if the influence of a work is not determined by the value of its argument but by the tone of its affect. Another part of this influence — the one on the followers of psychoanalysis — Bleuler himself destroyed later on by bringing into prominence in 1913, in his “Criticism of the Freudian School,” the obverse side of his attitude to psychoanalysis. Therein he takes away so much from the structure of the psychoanalytic principles that our opponents may well be satisfied with the assistance of this defender. It was not new arguments or better observations that served Bleuler as a guidance for these verdicts, but only the reference to his own knowledge, the inadequacy of which the author no longer admits as in his earlier writings. Here an almost irreparable loss seemed to threaten psychoanalysis. However, in his last utterance (“Die Kritiken der Schizophrenie,” 1914) on the occasion of the attacks made upon him owing to his introduction of psychoanalysis into his book on “Schizophrenie,” Bleuler rises to what he himself terms a “haughty presumption:” “But now I will assume a haughty presumption, I consider that the many psychologies to date have contributed mighty little to the explanation of the connection between psychogenetic symptoms and diseases, but that the deeper psychology (tiefen psychologie) furnishes us a part of the psychology still to be created, which the physician needs in order to understand his patients and to heal them rationally; and I even believe that in my ‘Schizophrenie’ I have taken a very small step towards this.” The first two assertions are surely correct, the latter may be an error.

Since by the “deeper psychology” psychoanalysis alone is to be understood, we may, for the present, remain satisfied with this admission.

III

"Cut it short!
On doomsday 'twon't be worth a farthing!"

Goethe.

Two years after the first congress the second private congress of psychoanalysts took place at Nuremberg, March, 1910. During the interval, whilst I was still under the impression of the favorable reception in America, the growing hostility in Germany and the unexpected support through the acquisition of the Zürich School, I had conceived a project which I was able to carry out, at this second congress, with the help of my friend S. Ferenczi. I had in mind to organize the psychoanalytic movement, to transfer its center to Zürich, and place it under a head who would take care of its future. As this found much opposition among the adherents of psychoanalysis, I will explain my motives more fully. Thus I hope to justify myself, even if it turns out that my action was not a very wise one.

I judged that the association with Vienna was no recommendation, but rather an obstacle for the new movement. A place like Zürich, in the heart of Europe, where an academic teacher had opened his institution to psychoanalysis, seemed to me much more promising. Moreover, I assumed that my own person was a second obstacle. The estimate put upon my personality was utterly confused by the favor or dislike from different factions. I was either compared to Darwin and Kepler or reviled as a paralytic. I, therefore, desired to push into the background not only the city whence psychoanalysis emanated, but also my own personality. Furthermore, I was no longer young, I saw a long road before me and I felt oppressed by the idea that it had fallen to my lot to become a leader in my advanced age. Yet I felt that there must be a leader. I knew only too well what mistakes lay in wait for him who would undertake the practice of psychoanalysis, and hoped that many of these might be avoided if we had an authority who was prepared to guide and admonish. Such authority naturally devolved upon me in view of the indisputable advantage of

fifteen years experience. It was now my desire to transfer this authority to a younger man who would, quite naturally, take my place on my death. I felt that this person could be only C. G. Jung, for Bleuler was of my own age. In favor of Jung was his conspicuous talents, the contributions he had already made to analysis, his independent position, and the impression of energy which his personality always made. He also seemed prepared to enter into friendly relations with me, and to give up, for my sake, certain race-prejudices which he had so far permitted himself to indulge. I had no notion then that in spite of the advantages enumerated, this was a very unfortunate choice; that it concerned a person who, incapable of tolerating the authority of another, was still less fitted to be himself an authority, one whose energy was devoted to the unscrupulous pursuit of his own interests.

The formation of an official organization I considered necessary because I feared the abuses to which psychoanalysis would be subjected, once it should achieve popularity. I felt that there should be a place that could give the dictum: “With all this nonsense, analysis has nothing to do; this is not psychoanalysis.” It was decided that at the meeting of the local groups which together formed the international organization, instruction should be given how psychoanalysis should be practised, that physicians should be trained there and that the local society should, in a way, stand sponsor for them. It also appeared to me desirable that the adherents of psychoanalysis should meet for friendly intercourse and mutual support, inasmuch as official science had pronounced its great ban and boycott against physicians and institutions practising psychoanalysis.

This and nothing else I wished to attain by the founding of the “International Psychoanalytic Association.” Perhaps it was more than could possibly be attained. Just as my opponents learned that it was not possible to stem the new movement, so I had to learn, by experience, that it would not permit itself to be led along the particular path which I had laid out for it. The motion made by Ferenczi at Nuremberg was seconded. Jung was elected president, and Riklin was chosen as secretary. It was also decided to publish a corresponding journal through which the central association was “to foster and further the science of psychoanalysis as founded by Freud both as pure psychology, as well as in its application to medicine and the mental sciences, and to promote assistance among the members in all their efforts to acquire and to spread psychoanalytic knowledge.” The members of the Vienna group alone firmly opposed the

project with passionate excitement. Adler expressed his fear that “a censorship and limitation of scientific freedom” was intended. The Viennese finally gave in, after having gained their point that Zürich should not be raised to the center of the association, but that the center should be the home city of the president, who was to be elected for two years.

At this congress three local groups were constituted: one in Berlin under the chairmanship of Abraham, one in Zürich, whose chairman became the president of the central association, and one in Vienna, the chairmanship of which I relinquished to Adler. A fourth group, in Budapest, could not be formed until later. On account of illness Bleuler had been absent from the congress. Later be evinced considerable hesitation about entering the association and although he let himself be persuaded to do so by my personal representations, he resigned a short time afterwards owing to disagreements at Zürich. This severed the connection between the Zürich group and the Burghölzli institution.

Another result of the Nuremberg Congress was the founding of the Zentralblatt für Psychoanalyse, which caused a reconciliation between Adler and Stekel. It had originally been intended as an opposing tendency and was to win back for Vienna the hegemony threatened by the election of Jung. But when the two founders of the journal, under pressure of the difficulty of finding a publisher, assured me of their friendly intentions and as guarantee of their attitude gave me the right to veto, I accepted the editorship and worked vigorously for this new organ, the first number of which appeared in September, 1910.

I will not continue the history of the Psychoanalytic Congress. The third one took place at Weimar, September, 1911, and even surpassed the previous ones in spirit and scientific interest. J. J. Putnam, who was present at this meeting, later expressed in America his satisfaction and his respect for the “mental attitude” of those present and quoted words which I was supposed to have used in reference to the latter: “They have learned to endure a bit of truth.” As a matter of fact any one who has attended scientific congresses must have received a lasting impression in favor of the Psychoanalytic Association. I myself had presided over two former congresses. I thought it best to give every lecturer ample time for his paper and left the discussions of these lectures to take place later as a sort of private exchange of ideas. Jung, who presided over the Weimar

meeting, reëstablished the discussions after each lecture, which had not, however, proved disturbing at that time.

Two years later, in September, 1913, quite another picture was presented by the congress at Münich which is still vividly recalled by those who were present. It was presided over by Jung in an unamiable and incorrect fashion: the lecturers were limited as to time, and the discussion dwarfed the lectures. Through a malicious mood of chance the evil genius of Hoche had taken up his residence in the same house in which the analysts held their meetings. Hoche could easily have convinced himself that his characterization of these psychoanalysts, as a sect, blindly and meekly following their leader, was true *ad absurdum.* The fatiguing and unedifying proceedings ended in the reëlection of Jung as president of the International Psychoanalytic Association, which fact Jung accepted, although two fifths of those present refused him their support. We took leave from one another without feeling the need to meet again!

About the time of this third Congress the condition of the International Psychoanalytic Association was as follows: The local groups at Vienna, Berlin, and Zürich had constituted themselves already at the congress at Nuremberg in 1910. In May, 1911, a group, under the chairmanship of Dr. L. Seif, was added at Münich. In the same year the first American local group was formed under the chairmanship of A. A. Brill under the name of "The New York Psychoanalytic Society." At the Weimar Congress, the founding of a second American group was authorized. This came into existence during the next year as "The American Psychoanalytic Association." It included members from Canada and all America; Putnam was elected president, and Ernest Jones was made secretary. Just before the congress at Münich in 1913, a local group was founded at Budapest under the leadership of S. Ferenczi. Soon afterwards Jones, who settled in London, founded the first English group. The number of members of the eight groups then in existence could not, of course, furnish any standard for the computation of the non-organized students and adherents of psychoanalysis.

The development of the periodical literature of psychoanalysis is also worthy of a brief mention. The first periodical publications serving the interests of analysis were the Schriften zur angewandten Seelenkunden which have appeared irregularly since 1907 and have reached the fifteenth volume. They published writings by Freud, Riklin, Jung, Abraham, Rank,

Sadger, Pfister, M. Graf, Jones, Storfer and Hug-Hellmuth. The founding of the Imago, to be mentioned later, has somewhat lowered the value of this form of publication. After the meeting at Salzburg, 1908, the Jahrbuch für psychoanalytische und psychopathologische Forschungen was founded, which appeared under Jung's editorship for five years, and it has now reappeared under new editorship and under the slightly changed title of Jahrbuch der Psychoanalyse. It no longer wishes to be as in former years, merely an archive for collecting works of psychoanalytic merit, but it wishes to justify its editorial task by taking due notice of all occurrences and all endeavors in the field of psychoanalysis. As mentioned before Das Zentralblatt für Psychoanalyse started by Adler and Stekel after the founding of the "International Association" (Nuremberg, 1910) went through in a short time a very varied career. Already in the tenth issue of the first volume there was an announcement that in view of scientific difference of opinion with the editors, Dr. Adler had decided voluntarily to withdraw his collaboration. This placed the entire editorship in the hands of Dr. Stekel (summer of 1911). At the Weimar congress the Zentralblatt was raised to the official organ of the "International Association" and by raising the annual dues it was made accessible to all members. Beginning with the third number of the second year (winter 1912) Stekel alone became responsible for the contents of the journal. His behavior, which is difficult to explain in public, forced me to sever all my connections with this journal and to give psychoanalysis in all haste a new organ, the International Journal for Medical Psychoanalysis (Internationale Zeitschrift für Ärztliche Psychoanalyse). With the help of almost all my collaborators and the new publisher, H. Heller, the first number of this new journal was able to appear in January, 1913, to take the place of the Zentralblatt as the official organ of the "International Psychoanalytic Association."

Meanwhile Dr. Hanns Sachs and Dr. Otto Rank founded early in 1912 a new journal, Imago (published by Heller), whose only aim is the application of psychoanalysis to mental sciences. Imago has now reached the middle of its third year, and enjoys the increasing interest of readers who are not medically interested in psychoanalysis.

Apart from these four periodical publications (Schriften z. Angew. Seelenkunde, Jahrbuch, Intern. Zeitschrift, and Imago) other German and foreign journals have contributed works that can claim a place in

psychoanalytic literature. The Journal of Abnormal Psychology, published by Morton Prince, as a rule, contains many good analytical contributions. In the winter of 1913 Dr. White and Dr. Jelliffe started a journal exclusively devoted to psychoanalysis, The Psychoanalytic Review, which takes into account the fact that most physicians in America interested in psychoanalysis do not master the German language.

I am now obliged to speak of two secessions which have taken place among the followers of psychoanalysis. The first of these took place in the interval between the founding of the association in 1910 and the congress at Weimar, 1911, the second took place after this, and came to light in Münich in 1913. The disappointment which they caused me might have been avoided if more attention had been paid to the mechanisms of those who undergo analytical treatment. I was well aware that any one might take flight on first approach to the unlovely truths of analysis; I myself had always asserted that any one's understanding may be suspended by one's own repressions (through the resistances which sustain them) so that in his relation to psychoanalysis he cannot get beyond a certain point. But I had not expected that any one who had mastered analysis to a certain depth could renounce this understanding and lose it. And yet daily experience with patients had shown that the total rejection of all knowledge gained through analysis may be brought about by any deeper stratum of particularly strong resistance. Even if we succeed through laborious work in causing such a patient to grasp parts of analytic knowledge and handle these as his own possessions, it may well happen that under the domination of the next resistance he will throw to the winds all he has learned and will defend himself as in his first days of treatment. I had to learn that this can happen among psychoanalysts just as among patients during treatment.

It is no enviable task to write the history of these two secessions, partly because I am not impelled to it by strong personal motives — I had not expected gratitude nor am I to any active degree revengeful — and partly because I know that I hereby lay myself open to the invectives of opponents manifesting but little consideration, and at the same time I regale the enemies of psychoanalysis with the long wished-for spectacle of seeing the psychoanalysts tearing each other to pieces. I had to exercise much control to keep myself from fighting with the opponents of psychoanalysis, and now I feel constrained to take up the fight with former

followers or such as still wish to be called so. I have no choice; to keep silent would be comfortable or cowardly, but it would hurt the subject more than the frank uncovering of the existing evils. Any one who has followed the growth of scientific movements will know that quite similar disturbancesand dissensions took place in all of them. It may be that elsewhere they are more carefully concealed. However, psychoanalysis, which denies many conventional ideals, is also more honest in these things.

Another very palpable inconvenience lies in the fact that I cannot altogether avoid going into an analytic elucidation. Analysis is not, however, suitable for polemical use; it always presupposes the consent of the one analyzed and the situation of a superior and subordinate. Therefore he who wishes to use analysis with polemic intent must offer no objection if the person so analyzed will, in his turn, use analysis against him, and if the discussion merges into a state in which the awakening of a conviction in an impartial third party is entirely excluded. I shall, therefore, make here the smallest possible use of analysis, thereby limiting my indiscretion and aggression against my opponents, and I will also add that I base no scientific criticism on this means. I have nothing to do with the possible substance of truths in the theories to be rejected nor am I seeking to refute the same. This task may be left to other able workers in the field of psychoanalysis, and some of it has already been done. I only desire to show that these theories deny the basic principles of analysis — I will show in what points — and for this reason should not be known under this name. I shall, therefore, use analysis only to make clear how these deviations from analysis could take place among analysts. At the parting places I am, of course, obliged to defend the just rights of psychoanalysis with purely critical remarks.

Psychoanalysis has found as its first task the explanation of the neuroses; it has taken the two facts of resistance and transference as starting points, and by bearing in mind the third fact of amnesia in the theories of repression, it has given justification to the sexual motive forces of the neuroses and of the unconscious. Psychoanalysis has never claimed to give a perfect theory of the human psychic life, but has only demanded that its discoveries should be used for the completion and correction of knowledge we have gained elsewhere. But Alfred Adler’s theory goes far beyond this goal. It pretends to explain with one stroke the behavior and

character of men as well as their neurotic and psychotic maladies. As a matter of fact, Adler's theory is more adequate to any other field than to that of the neuroses, which he still puts in the first place because of the history of its origin. I had the opportunity of studying Dr. Adler many years and have never denied him the testimonial of having a superior mind, especially endowed speculatively. As proof of the "persecution" which he claims to have suffered at my hands, I can only say that after the formation of the Association I handed over to him the leadership of the Vienna group. It was only after urgent requests from all the members of the society that I could be prevailed upon to resume the presidency at the scientific proceedings. When I had recognized Dr. Adler's slight talent for the estimation of the unconscious material, I expected that he would know how to discover the connections between psychoanalysis and psychology and the biological bases of the impulses, a discovery to which he was entitled, in a certain sense, through his valuable studies about the inferiority of organs. He really did bring out some thing, but his work makes the impression as if — to speak in his own jargon — it were intended to prove that psychoanalysis was wrong in everything and that the significance of the sexual impelling forces could only be due to gullibility about the assertions of neurotics. Of the personal motive of his work I may also speak publicly, since he himself revealed it in the presence of a small circle of members of the Vienna group. "Do you believe," he remarked, "that it is such a great pleasure for me to stand in your shadow my whole life?" To be sure I see nothing objectionable in the fact that a younger man should frankly admit an ambition which one might, in any case, suspect as one of the incentives of his work. But even under the domination of such a motive a man should know how to avoid being "unfair" as designated by the English with their fine social tact. We Germans have only a much coarser word at our disposal to convey this idea. How little Adler has succeeded in not being unfair is shown by the great number of mean outbursts of anger which distort his writings, and by the feeling of an ungovernable mania for priority which pervades his work. At the Vienna Psychoanalytic Society we once heard him claim for himself the priority for the viewpoints of the "unity of the neuroses" and the "dynamic conception" of the same. This was a great surprise for me as I had always believed that I had represented these two principles before I had ever known Adler.

This striving of Adler for a place in the sun has brought about, however, one result, which must be considered beneficial to psychoanalysis. When I was obliged to bring about Adler's resignation from the editorial staff of the Zentralblatt, after the appearance of his irreconcilable scientific antagonisms, Adler also left the Vienna group and founded a new society to which he first gave the tasteful name "Society for Free Psychoanalysis." But the outside public, unacquainted with analysis, is evidently as little skilled in recognizing the difference between the views of two psychoanalysts, as are Europeans in recognizing the tints between two Chinese faces. The "free" psychoanalysis remained in the shadow of the "official" and "orthodox" one, and was treated only as an appendage of the latter. Then Adler took the step for which we are thankful. He severed all connection with psychoanalysis and named his teachings "The Individual Psychology." There is much space on God's earth, and any one who can is surely justified in tumbling about upon it uninhibited; but it is not desirable to continue living under one roof when people no longer understand one another and no longer get on together. Adler's "Individual Psychology" is now one of the many psychological movements opposed to psychoanalysis, and its further development lies outside our interests.

Adler's theory was, from the very beginning, a "system," which psychoanalysis was careful not to become. It is also an excellent example of a "secondary elaboration" as seen, for example, in the process which the waking thought produces in dream material. In this case instead of dream material there is the material newly acquired from the viewpoint of the ego and brought under the familiar categories of the same. It is then translated, changed, and as thoroughly misunderstood as happens in the case of dream-formation. Adler's theory is thus characterized less by what it asserts than by what it denies. It consequently consists of three elements of quite dissimilar value; first, good contributions to the psychology of the ego, which are superfluous but admissible; secondly, translations of analytical facts into the new jargon, and, thirdly, distortions and perversions of these facts when they do not fit into the ego presuppositions. The elements of the first kind have never been ignored by psychoanalysis, although it owed no special attention to them. Psychoanalysis had a greater interest in showing that all ego strivings are mixed with libidinous components. Adler's theory emphasizes the counterpart to it; namely, that all libidinous feeling contains an admixture

of egotism. This would have been a palpable gain if Adler had not made use of this assertion to deny, every time, the libidinous feelings in favor of the impelling ego components. His theory thus does exactly what all patients do, and what our conscious thinking always does, it rationalizes, as Jones would say, in order to conceal the unconscious motives. Adler is so consistent in this, that he considers the object of evincing domination over the woman, to be on the top, as the mainspring of the sexual act. I do not know if he has upheld this monstrous idea in his writings.

Psychoanalysis early recognized that every neurotic symptom owes the possibility of its existence to some compromise. It must, therefore, also put to some good account the demands of the ego which manages the repression, it must offer it some advantages by finding for it some useful employment, otherwise it would suffer the same fate as the originally defended impulses. The term “morbid gain” expresses this state of affairs. One might even have been justified in differentiating the primary gain for the ego which must have been active at the origin, from a “secondary” gain which appears in connection with other intentions of the ego, when the symptom is about to assert itself. It has also long been known to analysis that the withdrawal of this morbid gain, or the cessation of the same in consequence of some real change, is one of the mechanisms in the cure of the symptom. On these relationships which can be verified and understood without difficulty, Adler’s theory puts the greatest emphasis. It entirely overlooks the fact that innumerable times the ego makes a virtue out of necessity in submitting to the most undesired symptom forced upon it, because of the use it can make of it, *e.g.*, when the ego accepts anxiety as a means of security. Here the ego plays the absurd part of the Pierot in the circus, who, through his gestures, wishes to convey to the spectators the impression that all changes in the menage are taking place at his command. But only the youngest among the spectators believe him.

For the second part of Adler’s theory psychoanalysis must stand security as for its own possessions. For it is nothing but psychoanalytic knowledge which the author had from all the sources opened to him during ten years of our joint work, but which he later marked as his own after changing the nomenclature. For instance, I myself consider “security” a better word than “protective measure,” which I used; but cannot find in it any new meaning. Similarly one will find in Adler’s statements a great many long-known features if one will replace the expressions “feigned”

(fingiert) fictive and fiction, by the original words “to fancy” and “phantasy.” This identity would be emphasized by psychoanalysis, even if the author had not for many years participated in our common work.

The third part of Adler’s theory, which consists in giving new interpretations to, and in distorting the disagreeable facts of psychoanalysis, contains that which definitely severs the actual “Individual Psychology” from psychoanalysis. As is known the principle of Adler’s system states that it is the object of the self-assertion of the individual, his “will to power” in the form of the “masculine protest,” to manifest itself domineeringly in the conduct of life, in character formation and in the neurosis. This “masculine protest,” the Adlerism motor, is nothing else, however, than the repression set free from its psychological mechanism, and what is more, it is sexualized and thus hardly in keeping with the vaunted expulsion of sexuality from its place in the psychic life. The “masculine protest” certainly exists, but in constituting it as the motor of the psychic life, observation has only played the part of the springboard which one leaves in order to uplift one’s self. Let us consider one of the most fundamental situations of the infantile desire; namely, the observation of the sexual act between adults by the child. When the life-history of such persons is later subjected to analysis by a physician, it is found that at this moment the minor spectator was seized by two feelings; one, in the case of a boy, to put himself in the place of the active man, and the other, the opposing feeling, to identify himself with the suffering woman. Both strivings conjointly exhaust the pleasure that might have resulted from this situation. Only the first feeling can come under the head of the “masculine protest” if this idea is to retain any meaning at all. The second feeling, whose fate Adler either ignores or does not know, is really the one which assumes greater significance in the later neurosis. Adler has placed himself so entirely into the jealous confinement of the ego, that he only accounts for such emotional feelings as are agreeable to the ego and furthered by it; but the case of the neurosis, which opposes these strivings, lies beyond his horizon.

Adler’s most serious deviations from the reality of observation and his deepest confusion of ideas have arisen in his attempt to correlate the basic principle of his theory with the psychic life of the child, an attempt which has become inevitable in psychoanalysis. The biological, social, and physiological meaning of “masculine” and “feminine” have here become

mixed into a hopeless composition. It is quite impossible, and it can easily be disproved by observation, that the masculine or feminine child builds its plan of life on any original undervaluation of the feminine sex; nor is it conceivable that a child can take as the guiding line the wish: “I will be a real man.” In the beginning no child has even an inkling of the significance of the difference in sex, more likely it starts with the assumption that both sexes possess the same (male) genital. It does not begin its sexual investigation with the problem of sex differentiation and is far from entertaining the social undervaluation of the woman. There are women in whose neurosis the wish to be a man never played any part. So far as the “masculine protest” is concerned, it can easily be traced back to a disturbance of the original narcissism caused by the threat of castration; that is, to the first hindrance of sexual activity. All dispute as to the psychogenesis of the neuroses must ultimately be decided in the sphere of the childhood neuroses. The careful analysis of a neurosis of the early years of childhood puts an end to all mistakes in regard to the etiology of the neuroses, and all doubts as to the part played by the sexual impulses. That is why Adler in his criticism of Jung’s “Conflicts of the Child’s Mind” was obliged to resort to the imputation that the material of the case surely must have followed a uniform new tendency “from the father.”

I will not linger any longer over the biological side of Adler’s theory, and will not examine whether the palpable inferiority of organs or the subjective feeling of the same (one often cannot tell which) can possibly be the basis of Adler’s system. Only permit me to remark that this would make the neurosis a by-product of the general stunting, while observation teaches that an excessively large number of hideous, misshapen, crippled, and wretched creatures have failed to react to their deficiencies by developing a neurosis. Nor will I consider the interesting information that the sense of inferiority goes back to infantile feelings. It shows us in what disguise the doctrine of infantilism, so much emphasized in psychoanalysis, returns in Adler’s Individual Psychology. On the other hand, I am obliged to emphasize how all psychological acquisitions of psychoanalysis have been disregarded by Adler. In his book “The Nervous Character,” the unconscious still appears as a psychological peculiarity, but without any relation to his system. Later, he declared, quite logically, that it was a matter of indifference to him whether any conception be conscious or unconscious. For the principle of repressions, Adler never

evinced any understanding. While reviewing a lecture before the Vienna Society in 1911, he said: “On the strength of a case I wish to point out that the patient had never repressed his libido, against which he continually tried to secure himself.” Soon thereafter at a discussion in Vienna Adler said: “If you ask whence comes the repression, you are told: from culture. But if you ask whence comes culture, the reply is: from the repression. So you see it is only a question of a play on words.” A small fragment of the sagacity used by Adler to defend his “nervous character” might have sufficed to show him the way out of this pettifogging argument. There is nothing mysterious about it, except that culture depends upon the acts of repression of former generations, and that each new generation is required to retain this culture by carrying out the same repressions. I have heard of a child that considered itself fooled and began to cry, because to the question: “Where do eggs come from?” it received the answer, “Eggs come from hens,” and to the further question: “Where do the hens come from?” the information was “From the eggs,” and yet this was not a play upon words. The child had been told what was true.

Just as deplorable and devoid of substance is all that Adler has said about the dream — that shibboleth of psychoanalysis. At first he considered the dream as a turning from the masculine to the feminine line, which simply means translating the theory of wish-fulfillment in dreams into the language of the “masculine protest.” Later he found that the essence of the dream lies in the fact that it enables man to realize unconsciously what is denied him consciously. Adler should also be credited with the priority of confounding the dream with the latent dream-thoughts, on the cognition of which rests his idea of “prospective tendency.” Maeder followed him in this, later on. In doing so he readily overlooks the fact that every interpretation of the dream which really tells nothing comprehensible in its manifest appearance rests upon the same dream-interpretation, whose assumptions and conclusions he is disputing. Concerning resistance Adler asserts that it serves to strengthen the patient against the physician. This is certainly correct. It means as much as saying that it serves the resistance. But whence this resistance originates, and how it happens that its phenomena serve the patient’s interest, these questions, as if of no interest for the ego, are not further discussed by Adler. The detailed mechanisms of symptoms and phenomena, the motivation of the variety of diseases and morbid manifestations, find no consideration at all

with Adler, since every thing is equally subservient to the “masculine protest,” to the self-assertion, and to the exaltation of the personality. The system is finished, at the expense of an extraordinary labor of new interpretation, yet it has not contributed a single new observation. I believe that I have succeeded in showing that his system has nothing what ever in common with psychoanalysis.

The picture which one derives from Adler’s system is founded entirely upon the impulse of aggression. It has no place at all for love. One might wonder that such a cheerless aspect of life should have received any notice whatever; but we must not forget that humanity, oppressed by its sexual needs, is prepared to accept any thing, if only the “overcoming of sexuality” is held out as bait.

The secession of Adler’s faction was finished before the Congress at Weimar which took place in 1911, while the one of the Swiss School began after this date. Strangely enough, the first indications of it were found in some remarks by Riklin in popular articles printed in Swiss literature, from which the general public learned, even before Riklin’s closest colleagues, that psychoanalysis had succeeded in overcoming some regretable mistakes which discredited it. In 1912 Jung boasted, in a letter to me from America, that his modifications of psychoanalysis had overcome the resistances to it in many persons, who hitherto wanted to know nothing about it. I replied that this was nothing to boast about, that the more he sacrificed of the hard-won truths of psychoanalysis, the less resistances he would encounter. This modification for the introduction of which the Swiss are so proud, again was nothing more or less than the theoretical suppression of the sexual factor. I admit that from the very beginning I have regarded this “progress” as a too-far-reaching adaptation to the demands of actuality.

These two retrogressive movements, tending away from psychoanalysis, which I will now compare, also resemble each other in the fact that they are seeking to obtain a favorable opinion by means of certain lofty points of view, as *sub specie æternitatis*. In the case of Adler, this role is played by the relativity of all knowledge, and by the rights of the personality to construe artificially any piece of knowledge to suit the individual; while Jung insists on the cultural historical rights of youth to throw off any fetters that tyrannical old age with ossified views would forge for it. These arguments require some repudiation. The relativity of

all our knowledge is a consideration which may be used as an argument against any other science besides psychoanalysis. This idea originates from well-known reactionary streams of the present day, inimical to science, and wishes to give the appearance of a superiority to which we are not entitled. Not one of us can guess what may be the ultimate judgment of mankind about our theoretical efforts. There are examples to show that what was dejected by the next three generations was corrected by the fourth and its recognition thus brought about. There is nothing else for the individual to do than to defend, with all his strength, his conviction based on experience after he has carefully listened to his own criticisms and has given some attention to the criticisms of his opponents. Let him be content to conduct his affair honestly and not assume the office of judge, which is reserved for a remote future. To accentuate personal arbitrariness in scientific matters is bad; it evidently wishes to deny to psychoanalysis the value of a science, which, to be sure, Adler has already depreciated by the aforementioned remark. Any one who highly regards scientific thinking will rather seek for means and methods by which to restrict, if possible, the factor of personal and artificial arbitrariness wherever it still plays too large a part. Besides one must remember that all agitation in defending is out of place. Adler does not take these arguments seriously. They are only for use against his opponents, but they respect his own theories. They have not prevented Adler's own adherents from celebrating him as the Messiah, for whose appearance waiting humanity had been prepared by so many forerunners. The Messiah is surely no longer anything relative.

Jung's argument *ad captandam benevolentiam* rests on the all-too-optimistic assumption that the progress of humanity, of civilization, and of knowledge has always continued in an unbroken line, as if there had never been any epigones, reactions, and restorations after every revolution, as if there had never been races who, because of a retrogression, had to renounce the gain of former generations. The approach to the standpoint of the masses, the giving up of an innovation that has proved unpopular, all these make it altogether unlikely that Jung's correction of psychoanalysis could lay claim to being a liberating act of youth. Finally it is not the years of the doer that decide it, but the character of the deed.

Of the two movements we have here considered, that headed by Adler is undoubtedly the more important. Though radically false, it is, nevertheless, characterized by consistency and coherence and it is still

founded on the theory of the impulse. On the other hand, Jung's modification has lessened the connection between the phenomena and the impulses: besides, as its critics (Abraham, Ferenczi, Jones) have already pointed out, it is so unintelligible, muddled, and confused, that it is not easy to take any attitude towards it. Wherever one touches it, one must be prepared to be told that one has misunderstood it, and it is impossible to know how one can arrive at a correct understanding of it. It represents itself in a peculiarly vacillating manner, since at one time it calls itself "a quite tame deviation, not worthy of the row which has arisen about it" (Jung), yet, at another time, it calls itself a new salvation with which a new epoch shall begin for psychoanalysis, in fact, a new aspect of the universe for everything else.

When one thinks of the disagreements between the individual private and public expressions of Jung's utterances one is obliged to ask to what extent this is due to his own lack of clearness and lack of sincerity. Yet, it must be admitted that the representatives of the new theory find themselves in a difficult position. They are now disputing things which they themselves formerly defended and what is more, this dispute is not based on new observations which might have taught them something fresh, but rather on a different interpretation which causes them to see things in a different light from that in which they saw them before. It is for this reason that they will not give up their connection with psychoanalysis as the representatives of which they first became known in the world. They prefer to proclaim that psychoanalysis has changed. At the Congress of Münich I was obliged to clear up this confusion and did so by declaring that I could not recognize the innovation of the Swiss School as a legitimate continuation and further development of the psychoanalysis which had originated with me. Outside critics (like Furtmüller) had already recognized this state of affairs and Abraham says, quite rightly, that Jung is in full retreat away from psychoanalysis. I am naturally entirely willing to admit that any one has the right to think and to write what he wishes, but he has not the right to make it out to be something different from what it really is.

Just as Adler's researches brought something new into psychoanalysis, a piece of the ego-psychology, and paid only too dearly for this gift by repudiating all the fundamental analytic principles, in the same way Jung and his adherents have based their fight against psychoanalysis upon a new

contribution to the same. They have traced in detail (what Pfister did before them) how the material of the sexual ideas originating in the family complex and in the incestuous object selection can be used to represent the highest ethical and religious interests of mankind, that is, they have explained a remarkable case of sublimation of the erotic impelling forces and the transformation of the same into strivings that can no longer be called erotic. All this harmonized very well with the assumptions of psychoanalysis, and would have agreed very well with the conception that in the dream and in the neurosis one sees the regressive elucidations of these and all other sublimations. But the world would have exclaimed that ethics and religion had been sexualized. I cannot help assuming "finally" that the investigators found themselves quite unequal to the storm they had to face. Perhaps the storm began to rage in their own bosoms. The previous theological history of so many of the Swiss workers is as important in their attitude to psychoanalysis as is the socialistic record of Adler for the development of his "psychology." One is reminded of Mark Twain's famous story about the fate of his watch and to the speculative remark with which he closed it: "And he used to wonder what became of all the unsuccessful tinkers, and gunsmiths, and shoemakers, and blacksmiths; but nobody could ever tell him."

I will encroach upon the realm of parables and will assume that in a certain society there lived a parvenu who boasted of descent from a very noble family not locally known. But it so happened that it was proved to him that his parents were living somewhere in the neighborhood and were very simple people, indeed. Only one way out remained to him and he seized upon it. He could no longer deny his parents, but he asserted that they were very aristocratic by origin but much come down in the world, and secured for them at some obliging office a document showing their descent. It seems to me that the Swiss workers had been obliged to act in a similar manner. If ethics and religion could not be sexualized, but must be regarded as something "higher" from the very beginning, and as their origin from the family and Œdipus complexes seemed undeniable, then there was only one way out; namely, that these complexes themselves, from the beginning, could not have the significance which they appeared to express, but must have that higher "anagogic" sense (to use Silberer's nomenclature) with which they adapt themselves for proper use in the abstract streams of thought of ethics and religious mysticism.

I am quite prepared to be told once more that I have misunderstood the contents and object of the theory of the New-Zürich School, but here wish to protest against being held responsible for those contradictions to my theories that have arisen as a result of the publications of this school. The burden of responsibility rests on them, not on me. In no other way can I make comprehensible to myself the ensemble of Jung's innovations or grasp them in their associations. All the changes which Jung has perpetrated upon psychoanalysis originated in the intention of setting aside all that is objectionable in the family complexes, in order that these objectionable features may not be found again in religion and ethics. The sexual libido was replaced by an abstract idea, of which it may be said that it remained equally mysterious and incomprehensible alike to fools and to the wise. The Œdipus-complex, we are told, has only a "symbolical" sense, the mother therein representing the unattainable which must be renounced in the interests of cultural development. The father who is killed in the Œdipus myth represents the "inner" father from whose influence we must free ourselves in order to become independent. No doubt other portions of the material of sexual conceptions will, in time, receive similarly new interpretations. In place of the conflict between erotic strivings adverse to the ego and the self-assertion, we are given the conflict between the "life-task" and the "psychic-laziness." The neurotic guilty conscience corresponds with the reproach of not having put to good account one's life-task. Thus a new religio-ethical system was founded which, exactly like Adler's, was obliged to give new interpretations, to distort or set aside the actual results of analysis. As a matter of fact they have caught a few cultural higher notes from the symphony of the world's by-gones, but once again have failed to hear the powerful melody of the impulses.

In order to hold this system together it was necessary to draw away entirely from the observations and technique of psychoanalysis. Now and then the enthusiasm for the higher cause even permits a total disregard for scientific logic, as for instance, when Jung maintains that the Œdipus complex is not "specific" enough for the etiology of the neuroses, and ascribed this specificity to laziness, that is, to the most universal quality of animate and inanimate bodies! Moreover, it is to be remarked that the "Œdipus complex" only represents a capacity on which the psychic forces of the individual measure themselves, and is not in itself a force, like the

“psychic laziness.” The study of the individual man has shown and always will show that the sexual complexes are alive in him in their original sense. That is why the study of the individual was pushed back by Jung and replaced by the judgment of the essential facts from the study of the races. As the study of the early childhood of every man exposed one to the danger of striking against the original and undisguised meaning of these misinterpreted complexes, it was, therefore, thought best to make it a rule to tarry as little as possible at this past and to place the greatest emphasis on the return to the conflict. Here, moreover, the essential things are not at all the incidental and personal, but rather the general, that is to say, the “non-fulfilment of the life-task.” Nevertheless, we know that the actual conflict of the neurotic becomes comprehensible and solvable only if it can be traced back into the patient’s past history, only by following along the way that his libido took when his malady began.

How the New Zürich therapy has shaped itself under such tendencies I can convey by means of reports of a patient who was himself obliged to experience it.

“Not the slightest effort was made to consider the past or the transferences. Whenever I thought that the latter were touched, they were explained as a mere symbol of the libido. The moral instructions were very beautiful and I followed them faithfully, but I did not advance one step. This was more distressing to me than to the physician, but how could I help it? — Instead of freeing me analytically, each session made new and tremendous demands on me, on the fulfilment of which the overcoming of the neurosis was supposed to depend. Some of these demands were: inner concentration by means of introversion, religious meditation, living together with my wife in loving devotion, etc. It was almost beyond my power, since it really amounted to a radical transformation of the whole spiritual man. I left the analysis as a poor sinner with the strongest feelings of contrition and the very best resolutions, but at the same time with the deepest discouragement. All that this physician recommended any pastor would have advised, but where was I to get the strength?”

It is true that the patient had also heard that an analysis of the past and of the transference should precede the process. He, however, was told that he had enough of it. But as it had not helped him, it seems to me that it is just to conclude that the patient had not had enough of this first sort of analysis. Not in any case has the superimposed treatment which no longer

has the slightest claim to call itself psychoanalysis, helped. It is a matter of wonder that the men of Zürich had need to make the long detour via Vienna to reach Bern, so close to them, where Dubois cures neuroses by ethical encouragement in the most indulgent fashion.

The utter disagreement of this new movement with psychoanalysis naturally shows itself also in its attitude towards repression, which is hardly mentioned any more in the writings of Jung; in the utter misconstruction of the dream which Adler, ignoring the dream-psychology, confuses with the latent dream-thoughts, and also in the lack of understanding of the unconscious. In fact this disagreement can be seen in all the essential points of psychoanalysis. When Jung tells us that the incest-complex is only "symbolic." that it has "no real existence," that the savage feels no desire towards the old hag but prefers a young and pretty woman, then one is tempted to assume in order to dispose of apparent contradiction that "symbolic" and "no real existence" only signify what is designated as "existing unconsciously."

If one maintains that the dream is something different from the latent dream-thoughts, which it elaborates, one will not wonder that the patients dream of those things with which their mind has been filled during the treatment, whether it be the "life-task" or being "above" or "below." Certainly the dreams of those analyzed are guidable in a similar manner as dreams can be influenced by the application of experimental stimuli. One may determine a part of the material that occurs in the dream, but this changes nothing in the nature and mechanism of the dream. Nor do I believe that the so-called "biographical" dream occurs outside of the analysis. On the other hand, if we analyze dreams that occurred before the treatment began, or if attention is paid to what the dreamer adds to the stimuli supplied to him during the treatment, or if we avoid giving him any such task, then we can convince ourselves how far the dream is from offering tentative solutions of the life-task. For the dream is only another form of thinking; the understanding of this form can never be gained from the content of its thoughts, only the consideration of the dream-work will lead to it.

The effective refutation of Jung's misconceptions of psychoanalysis and his deviations from it is not difficult. Any analysis carried out in accordance with the rules, especially any analysis of a child, strengthens the convictions on which the theory of psychoanalysis rests, and

repudiates the new interpretations of Adler's and Jung's systems. Jung himself, before he became enlightened, carried out such an analysis of a child and published it. It remains to be seen if he will undertake a new interpretation of this case with the help of another "uniform new tendency of the facts," to give Adler's expression used in this connection.

The opinion that the sexual representation of "higher" ideas in the dream and in the neurosis is nothing but an archaic manner of expression, is naturally irreconcilable with the fact that these sexual complexes prove to be in the neurosis the carriers of those quantities of libido which have been withdrawn from the real life. If it were only a question of sexual jargon, nothing could thereby be altered in the economy of the libido itself. Jung himself admits this in his "Darstellung der psychoanalytischen Theorie," and formulates, as a therapeutic task, that the libido investing the complexes should be withdrawn from them. But this can never be accomplished by rejecting the complexes and forcing them towards sublimation, but only by the most exhaustive occupation with them, and by making them fully conscious. The first bit of reality with which the patient has to deal is his malady itself. Any effort to spare him this task points to an incapacity of the physician to help him in overcoming his resistances, or to a fear on the part of the physician as to the results of this work.

I would like to say in conclusion that Jung, by his "modifications" has furnished psychoanalysis with a counterpart to the famous knife of Lichtenberg. He has changed the hilt, has inserted into it a new blade, and because the same trademark is engraved on it he requires of us that we regard the instrument as the former one.

On the contrary, I believe I have shown that the new theory which desires to substitute psychoanalysis signifies an abandonment of analysis and a secession from it. Some may be inclined to fear that this defection may be more unfortunate for the fate of psychoanalysis than any other because it emanates from persons who once played so great a part in the psychoanalytic movement and did so much to further it. I do not share this apprehension.

Men are strong so long as they represent a strong idea. They become powerless when they oppose it. Psychoanalysis will be able to bear this loss and will gain new adherents for those lost.

I can only conclude with the wish that the fates may prepare an easy ascension for those who found their sojourn in the underworld of psychoanalysis uncomfortable. May it be vouchsafed to the others to bring to a happy conclusion their works in the deep.

PREFACE

Few, especially in this country, realize that while Freudian themes have rarely found a place on the programs of the American Psychological Association, they have attracted great and growing attention and found frequent elaboration by students of literature, history, biography, sociology, morals and aesthetics, anthropology, education, and religion. They have given the world a new conception of both infancy and adolescence, and shed much new light upon characterology; given us a new and clearer view of sleep, dreams, reveries, and revealed hitherto unknown mental mechanisms common to normal and pathological states and processes, showing that the law of causation extends to the most incoherent acts and even verbigerations in insanity; gone far to clear up the *terra incognita* of hysteria; taught us to recognize morbid symptoms, often neurotic and psychotic in their germ; revealed the operations of the primitive mind so overlaid and repressed that we had almost lost sight of them; fashioned and used the key of symbolism to unlock many mysticisms of the past; and in addition to all this, affected thousands of cures, established a new prophylaxis, and suggested new tests for character, disposition, and ability, in all combining the practical and theoretic to a degree salutary as it is rare.

These twenty-eight lectures to laymen are elementary and almost conversational. Freud sets forth with a frankness almost startling the difficulties and limitations of psychoanalysis, and also describes its main methods and results as only a master and originator of a new school of thought can do. These discourses are at the same time simple and almost confidential, and they trace and sum up the results of thirty years of devoted and painstaking research. While they are not at all controversial, we incidentally see in a clearer light the distinctions between the master and some of his distinguished pupils. A text like this is the most opportune and will naturally more or less supersede all other introductions to the general subject of psychoanalysis. It presents the author in a new light, as an effective and successful popularizer, and is certain to be welcomed not only by the large and growing number of students of psychoanalysis in this country but by the yet larger number of those who wish to begin its study here and elsewhere.

The impartial student of Sigmund Freud need not agree with all his conclusions, and indeed, like the present writer, may be unable to make sex so all-dominating a factor in the psychic life of the past and present as Freud deems it to be, to recognize the fact that he is the most original and creative mind in psychology of our generation. Despite the frightful handicap of the *odium sexicum*, far more formidable today than the *odium theologicum*, involving as it has done for him lack of academic recognition and even more or less social ostracism, his views have attracted and inspired a brilliant group of minds not only in psychiatry but in many other fields, who have altogether given the world of culture more new and pregnant *appercus* than those which have come from any other source within the wide domain of humanism.

A former student and disciple of Wundt, who recognizes to the full his inestimable services to our science, cannot avoid making certain comparisons. Wundt has had for decades the prestige of a most advantageous academic chair. He founded the first laboratory for experimental psychology, which attracted many of the most gifted and mature students from all lands. By his development of the doctrine of apperception he took psychology forever beyond the old associationism which had ceased to be fruitful. He also established the independence of psychology from physiology, and by his encyclopedic and always thronged lectures, to say nothing of his more or less esoteric seminary, he materially advanced every branch of mental science and extended its influence over the whole wide domain of folklore, mores, language, and primitive religion. His best texts will long constitute a thesaurus which every psychologist must know.

Again, like Freud, he inspired students who went beyond him (the Wurzburgers and introspectionists) whose method and results he could not follow. His limitations have grown more and more manifest. He has little use for the unconscious or the abnormal, and for the most part he has lived and wrought in a preevolutionary age and always and everywhere underestimated the genetic standpoint. He never transcends the conventional limits in dealing, as he so rarely does, with sex. Nor does he contribute much likely to be of permanent value in any part of the wide domain of affectivity. We cannot forbear to express the hope that Freud will not repeat Wundt’s error in making too abrupt a break with his more advanced pupils like Adler or the Zurich group. It is rather precisely just

the topics that Wundt neglects that Freud makes his chief corner-stones, viz., the unconscious, the abnormal, sex, and affectivity generally, with many genetic, especially ontogenetic, but also phylogenetic factors. The Wundtian influence has been great in the past, while Freud has a great present and a yet greater future.

In one thing Freud agrees with the introspectionists, viz., in deliberately neglecting the "physiological factor" and building on purely psychological foundations, although for Freud psychology is mainly unconscious, while for the introspectionists it is pure consciousness. Neither he nor his disciples have yet recognized the aid proffered them by students of the autonomic system or by the distinctions between the epicritic and protopathic functions and organs of the cerebrum, although these will doubtless come to have their due place as we know more of the nature and processes of the unconscious mind.

If psychologists of the normal have hitherto been too little disposed to recognize the precious contributions to psychology made by the cruel experiments of Nature in mental diseases, we think that the psychoanalysts, who work predominantly in this field, have been somewhat too ready to apply their findings to the operations of the normal mind; but we are optomistic enough to believe that in the end both these errors will vanish and that in the great synthesis of the future that now seems to impend our science will be made vastly richer and deeper on the theoretical side and also far more practical than it has ever been before.

G. STANLEY HALL.

Clark University,
April, 1920.

PART I. THE PSYCHOLOGY OF ERRORS

FIRST LECTURE. INTRODUCTION

I DO not know how familiar some of you may be, either from your reading or from hearsay, with psychoanalysis. But, in keeping with the title of these lectures — *A General Introduction to Psychoanalysis* — I am obliged to proceed as though you knew nothing about this subject, and stood in need of preliminary instruction.

To be sure, this much I may presume that you do know, namely, that psychoanalysis is a method of treating nervous patients medically. And just at this point I can give you an example to illustrate how the procedure in this field is precisely the reverse of that which is the rule in medicine. Usually when we introduce a patient to a medical technique which is strange to him we minimize its difficulties and give him confident promises concerning the result of the treatment. When, however, we undertake psychoanalytic treatment with a neurotic patient we proceed differently. We hold before him the difficulties of the method, its length, the exertions and the sacrifices which it will cost him; and, as to the result, we tell him that we make no definite promises, that the result depends on his conduct, on his understanding, on his adaptability, on his perseverance. We have, of course, excellent motives for conduct which seems so perverse, and into which you will perhaps gain insight at a later point in these lectures.

Do not be offended, therefore, if, for the present, I treat you as I treat these neurotic patients. Frankly, I shall dissuade you from coming to hear me a second time. With this intention I shall show what imperfections are necessarily involved in the teaching of psychoanalysis and what difficulties stand in the way of gaining a personal judgment. I shall show you how the whole trend of your previous training and all your accustomed mental habits must unavoidably have made you opponents of psychoanalysis, and how much you must overcome in yourselves in order to master this instinctive opposition. Of course I cannot predict how much psychoanalytic understanding you will gain from my lectures, but I can promise this, that by listening to them you will not learn how to undertake a psychoanalytic treatment or how to carry one to completion. Furthermore, should I find anyone among you who does not feel satisfied with a cursory acquaintance with psychoanalysis, but who would like to enter into a more enduring relationship with it, I shall not only dissuade

him, but I shall actually warn him against it. As things now stand, a person would, by such a choice of profession, ruin his every chance of success at a university, and if he goes out into the world as a practicing physician, he will find himself in a society which does not understand his aims, which regards him with suspicion and hostility, and which turns loose upon him all the malicious spirits which lurk within it.

However, there are always enough individuals who are interested in anything which may be added to the sum total of knowledge, despite such inconveniences. Should there be any of this type among you, and should they ignore my dissuasion and return to the next of these lectures, they will be welcome. But all of you have the right to know what these difficulties of psychoanalysis are to which I have alluded.

First of all, we encounter the difficulties inherent in the teaching and exposition of psychoanalysis. In your medical instruction you have been accustomed to visual demonstration. You see the anatomical specimen, the precipitate in the chemical reaction, the contraction of the muscle as the result of the stimulation of its nerves. Later the patient is presented to your senses; the symptoms of his malady, the products of the pathological processes, in many cases even the cause of the disease is shown in isolated state. In the surgical department you are made to witness the steps by which one brings relief to the patient, and are permitted to attempt to practice them. Even in psychiatry, the demonstration affords you, by the patient’s changed facial play, his manner of speech and his behavior, a wealth of observations which leave far-reaching impressions. Thus the medical teacher preponderantly plays the role of a guide and instructor who accompanies you through a museum in which you contract an immediate relationship to the exhibits, and in which you believe yourself to have been convinced through your own observation of the existence of the new things you see.

Unfortunately, everything is different in psychoanalysis. In psychoanalysis nothing occurs but the interchange of words between the patient and the physician. The patient talks, tells of his past experiences and present impressions, complains, confesses his wishes and emotions. The physician listens, tries to direct the thought processes of the patient, reminds him of things, forces his attention into certain channels, gives him explanations and observes the reactions of understanding or denial which he calls forth in the patient. The uneducated relatives of our patients —

persons who are impressed only by the visible and tangible, preferably by such procedure as one sees in the moving picture theatres — never miss an opportunity of voicing their scepticism as to how one can “do anything for the malady through mere talk.” Such thinking, of course, is as shortsighted as it is inconsistent. For these are the very persons who know with such certainty that the patients “merely imagine” their symptoms. Words were originally magic, and the word retains much of its old magical power even to-day. With words one man can make another blessed, or drive him to despair; by words the teacher transfers his knowledge to the pupil; by words the speaker sweeps his audience with him and determines its judgments and decisions. Words call forth effects and are the universal means of influencing human beings. Therefore let us not underestimate the use of words in psychotherapy, and let us be satisfied if we may be auditors of the words which are exchanged between the analyst and his patient.

But even that is impossible. The conversation of which the psychoanalytic treatment consists brooks no auditor, it cannot be demonstrated. One can, of course, present a neurasthenic or hysteric to the students in a psychiatric lecture. He tells of his complaints and symptoms, but of nothing else. The communications which are necessary for the analysis are made only under the conditions of a special affective relationship to the physician; the patient would become dumb as soon as he became aware of a single impartial witness. For these communications concern the most intimate part of his psychic life, everything which as a socially independent person he must conceal from others; these communications deal with everything which, as a harmonious personality, he will not admit even to himself.

You cannot, therefore, “listen in” on a psychoanalytic treatment. You can only hear of it. You will get to know psychoanalysis, in the strictest sense of the word, only by hearsay. Such instruction even at second hand, will place you in quite an unusual position for forming a judgment. For it is obvious that everything depends on the faith you are able to put in the instructor.

Imagine that you are not attending a psychiatric, but an historical lecture, and that the lecturer is telling you about the life and martial deeds of Alexander the Great. What would be your reasons for believing in the authenticity of his statements? At first sight, the condition of affairs seems

even more unfavorable than in the case of psychoanalysis, for the history professor was as little a participant in Alexander's campaigns as you were; the psychoanalyst at least tells you of things in connection with which he himself has played some role. But then the question turns on this — what set of facts can the historian marshal in support of his position? He can refer you to the accounts of ancient authors, who were either contemporaries themselves, or who were at least closer to the events in question; that is, he will refer you to the books of Diodor, Plutarch, Arrian, etc. He can place before you pictures of the preserved coins and statues of the king and can pass down your rows a photograph of the Pompeiian mosaics of the battle of Issos. Yet, strictly speaking, all these documents prove only that previous generations already believed in Alexander's existence and in the reality of his deeds, and your criticism might begin anew at this point. You will then find that not everything recounted of Alexander is credible, or capable of proof in detail; yet even then I cannot believe that you will leave the lecture hall a disbeliever in the reality of Alexander the Great. Your decision will be determined chiefly by two considerations; firstly, that the lecturer has no conceivable motive for presenting as truth something which he does not himself believe to be true, and secondly, that all available histories present the events in approximately the same manner. If you then proceed to the verification of the older sources, you will consider the same data, the possible motives of the writers and the consistency of the various parts of the evidence. The result of the examination will surely be convincing in the case of Alexander. It will probably turn out differently when applied to individuals like Moses and Nimrod. But what doubts you might raise against the credibility of the psychoanalytic reporter you will see plainly enough upon a later occasion.

At this point you have a right to raise the question, "If there is no such thing as objective verification of psychoanalysis, and no possibility of demonstrating it, how can one possibly learn psychoanalysis and convince himself of the truth of its claims?" The fact is, the study is not easy and there are not many persons who have learned psychoanalysis thoroughly; but nevertheless, there is a feasible way. Psychoanalysis is learned, first of all, from a study of one's self, through the study of one's own personality. This is not quite what is ordinarily called self-observation, but, at a pinch, one can sum it up thus. There is a whole series of very common and

universally known psychic phenomena, which, after some instruction in the technique of psychoanalysis, one can make the subject matter of analysis in one's self. By so doing one obtains the desired conviction of the reality of the occurrences which psychoanalysis describes and of the correctness of its fundamental conception. To be sure, there are definite limits imposed on progress by this method. One gets much further if one allows himself to be analyzed by a competent analyst, observes the effect of the analysis on his own ego, and at the same time makes use of the opportunity to become familiar with the finer details of the technique of procedure. This excellent method is, of course, only practicable for one person, never for an entire class.

There is a second difficulty in your relation to psychoanalysis for which I cannot hold the science itself responsible, but for which I must ask you to take the responsibility upon yourselves, ladies and gentlemen, at least in so far as you have hitherto pursued medical studies. Your previous training has given your mental activity a definite bent which leads you far away from psychoanalysis. You have been trained to reduce the functions of an organism and its disorders anatomically, to explain them in terms of chemistry and physics and to conceive them biologically, but no portion of your interest has been directed to the psychic life, in which, after all, the activity of this wonderfully complex organism culminates. For this reason psychological thinking has remained strange to you and you have accustomed yourselves to regard it with suspicion, to deny it the character of the scientific, to leave it to the laymen, poets, natural philosophers and mystics. Such a delimitation is surely harmful to your medical activity, for the patient will, as is usual in all human relationships, confront you first of all with his psychic facade; and I am afraid your penalty will be this, that you will be forced to relinquish a portion of the therapeutic influence to which you aspire, to those lay physicians, nature-cure fakers and mystics whom you despise.

I am not overlooking the excuse, whose existence one must admit, for this deficiency in your previous training. There is no philosophical science of therapy which could be made practicable for your medical purpose. Neither speculative philosophy nor descriptive psychology nor that so-called experimental psychology which allies itself with the physiology of the sense organs as it is taught in the schools, is in a position to teach you anything useful concerning the relation between the physical and the

psychical or to put into your hand the key to the understanding of a possible disorder of the psychic functions. Within the field of medicine, psychiatry does, it is true, occupy itself with the description of the observed psychic disorders and with their grouping into clinical symptom-pictures; but in their better hours the psychiatrists themselves doubt whether their purely descriptive account deserves the name of a science. The symptoms which constitute these clinical pictures are known neither in their origin, in their mechanism, nor in their mutual relationship. There are either no discoverable corresponding changes of the anatomical organ of the soul, or else the changes are of such a nature as to yield no enlightenment. Such psychic disturbances are open to therapeutic influence only when they can be identified as secondary phenomena of an otherwise organic affection.

Here is the gap which psychoanalysis aims to fill. It prepares to give psychiatry the omitted psychological foundation, it hopes to reveal the common basis from which, as a starting point, constant correlation of bodily and psychic disturbances becomes comprehensible. To this end, it must divorce itself from every anatomical, chemical or physiological supposition which is alien to it. It must work throughout with purely psychological therapeutic concepts, and just for that reason I fear that it will at first seem strange to you.

I will not make you, your previous training, or your mental bias share the guilt of the next difficulty. With two of its assertions, psychoanalysis offends the whole world and draws aversion upon itself. One of these assertions offends an intellectual prejudice, the other an aesthetic-moral one. Let us not think too lightly of these prejudices; they are powerful things, remnants of useful, even necessary, developments of mankind. They are retained through powerful affects, and the battle against them is a hard one.

The first of these displeasing assertions of psychoanalysis is this, that the psychic processes are in themselves unconscious, and that those which are conscious are merely isolated acts and parts of the total psychic life. Recollect that we are, on the contrary, accustomed to identify the psychic with the conscious. Consciousness actually means for us the distinguishing characteristic of the psychic life, and psychology is the science of the content of consciousness. Indeed, so obvious does this identification seem to us that we consider its slightest contradiction obvious nonsense, and yet

psychoanalysis cannot avoid raising this contradiction; it cannot accept the identity of the conscious with the psychic. Its definition of the psychic affirms that they are processes of the nature of feeling, thinking, willing; and it must assert that there is such a thing as unconscious thinking and unconscious willing. But with this assertion psychoanalysis has alienated, to start with, the sympathy of all friends of sober science, and has laid itself open to the suspicion of being a fantastic mystery study which would build in darkness and fish in murky waters. You, however, ladies and gentlemen, naturally cannot as yet understand what justification I have for stigmatizing as a prejudice so abstract a phrase as this one, that "the psychic is consciousness." You cannot know what evaluation can have led to the denial of the unconscious, if such a thing really exists, and what advantage may have resulted from this denial. It sounds like a mere argument over words whether one shall say that the psychic coincides with the conscious or whether one shall extend it beyond that, and yet I can assure you that by the acceptance of unconscious processes you have paved the way for a decisively new orientation in the world and in science.

Just as little can you guess how intimate a connection this initial boldness of psychoanalysis has with the one which follows. The next assertion which psychoanalysis proclaims as one of its discoveries, affirms that those instinctive impulses which one can only call sexual in the narrower as well as in the wider sense, play an uncommonly large role in the causation of nervous and mental diseases, and that those impulses are a causation which has never been adequately appreciated. Nay, indeed, psychoanalysis claims that these same sexual impulses have made contributions whose value cannot be overestimated to the highest cultural, artistic and social achievements of the human mind.

According to my experience, the aversion to this conclusion of psychoanalysis is the most significant source of the opposition which it encounters. Would you like to know how we explain this fact? We believe that civilization was forged by the driving force of vital necessity, at the cost of instinct-satisfaction, and that the process is to a large extent constantly repeated anew, since each individual who newly enters the human community repeats the sacrifices of his instinct-satisfaction for the sake of the common good. Among the instinctive forces thus utilized, the sexual impulses play a significant role. They are thereby sublimated, i.e., they are diverted from their sexual goals and directed to ends socially

higher and no longer sexual. But this result is unstable. The sexual instincts are poorly tamed. Each individual who wishes to ally himself with the achievements of civilization is exposed to the danger of having his sexual instincts rebel against this sublimation. Society can conceive of no more serious menace to its civilization than would arise through the satisfying of the sexual instincts by their redirection toward their original goals. Society, therefore, does not relish being reminded of this ticklish spot in its origin; it has no interest in having the strength of the sexual instincts recognized and the meaning of the sexual life to the individual clearly delineated. On the contrary, society has taken the course of diverting attention from this whole field. This is the reason why society will not tolerate the above-mentioned results of psychoanalytic research, and would prefer to brand it as aesthetically offensive and morally objectionable or dangerous. Since, however, one cannot attack an ostensibly objective result of scientific inquiry with such objections, the criticism must be translated to an intellectual level if it is to be voiced. But it is a predisposition of human nature to consider an unpleasant idea untrue, and then it is easy to find arguments against it. Society thus brands what is unpleasant as untrue, denying the conclusions of psychoanalysis with logical and pertinent arguments. These arguments originate from affective sources, however, and society holds to these prejudices against all attempts at refutation.

However, we may claim, ladies and gentlemen, that we have followed no bias of any sort in making any of these contested statements. We merely wished to state facts which we believe to have been discovered by toilsome labor. And we now claim the right unconditionally to reject the interference in scientific research of any such practical considerations, even before we have investigated whether the apprehension which these considerations are meant to instil are justified or not.

These, therefore, are but a few of the difficulties which stand in the way of your occupation with psychoanalysis. They are perhaps more than enough for a beginning. If you can overcome their deterrent impression, we shall continue.

SECOND LECTURE. THE PSYCHOLOGY OF ERRORS

WE begin with an investigation, not with hypotheses. To this end we choose certain phenomena which are very frequent, very familiar and very little heeded, and which have nothing to do with the pathological, inasmuch as they can be observed in every normal person. I refer to the errors which an individual commits — as for example, errors of speech in which he wishes to say something and uses the wrong word; or those which happen to him in writing, and which he may or may not notice; or the case of misreading, in which one reads in the print or writing something different from what is actually there. A similar phenomenon occurs in those cases of mishearing what is said to one, where there is no question of an organic disturbance of the auditory function. Another series of such occurrences is based on forgetfulness — but on a forgetfulness which is not permanent, but temporary, as for instance when one cannot think of a name which one knows and always recognizes; or when one forgets to carry out a project at the proper time but which one remembers again later, and therefore has only forgotten for a certain interval. In a third class this characteristic of transience is lacking, as for example in mislaying things so that they cannot be found again, or in the analogous case of losing things. Here we are dealing with a kind of forgetfulness to which one reacts differently from the other cases, a forgetfulness at which one is surprised and annoyed, instead of considering it comprehensible. Allied with these phenomena is that of erroneous ideas — in which the element of transience is again prominent, inasmuch as for a while one believes something which, before and after that time, one knows to be untrue — and a number of similar phenomena of different designations.

These are all occurrences whose inner connection is expressed in the use of the same prefix of designation. They are almost all unimportant, generally temporary and without much significance in the life of the individual. It is only rarely that one of them, such as the phenomenon of losing things, attains to a certain practical importance. For that reason also they do not attract much attention, they arouse only weak affects.

It is, therefore, to these phenomena that I would now direct your attention. But you will object, with annoyance: “There are so many sublime riddles in the external world, just as there are in the narrower

world of the psychic life, and so many wonders in the field of psychic disturbances which demand and deserve elucidation, that it really seems frivolous to waste labor and interest on such trifles. If you can explain to us how an individual with sound eyes and ears can, in broad daylight, see and hear things that do not exist, or why another individual suddenly believes himself persecuted by those whom up to that time he loved best, or defend, with the most ingenious arguments, delusions which must seem nonsense to any child, then we will be willing to consider psychoanalysis seriously. But if psychoanalysis can do nothing better than to occupy us with the question of why a speaker used the wrong word, or why a housekeeper mislaid her keys, or such trifles, then we know something better to do with our time and interest."

My reply is: "Patience, ladies and gentlemen. I think your criticism is not on the right track. It is true that psychoanalysis cannot boast that it has never occupied itself with trifles. On the contrary, the objects of its observations are generally those simple occurrences which the other sciences have thrown aside as much too insignificant, the waste products of the phenomenal world. But are you not confounding, in your criticism, the sublimity of the problems with the conspicuousness of their manifestations? Are there not very important things which under certain circumstances, and at certain times, can betray themselves only by very faint signs? I could easily cite a great many instances of this kind. From what vague signs, for instance, do the young gentlemen of this audience conclude that they have won the favor of a lady? Do you await an explicit declaration, an ardent embrace, or does not a glance, scarcely perceptible to others, a fleeting gesture, the prolonging of a hand-shake by one second, suffice? And if you are a criminal lawyer, and engaged in the investigation of a murder, do you actually expect the murderer to leave his photograph and address on the scene of the crime, or would you, of necessity, content yourself with fainter and less certain traces of that individual? Therefore, let us not undervalue small signs; perhaps by means of them we will succeed in getting on the track of greater things. I agree with you that the larger problems of the world and of science have the first claim on our interest. But it is generally of little avail to form the definite resolution to devote oneself to the investigation of this or that problem. Often one does not know in which direction to take the next step. In scientific research it is more fruitful to attempt what happens to be before one at the moment

and for whose investigation there is a discoverable method. If one does that thoroughly without prejudice or predisposition, one may, with good fortune, and by virtue of the connection which links each thing to every other (hence also the small to the great) discover even from such modest research a point of approach to the study of the big problems."

Thus would I answer, in order to secure your attention for the consideration of these apparently insignificant errors made by normal people. At this point, we will question a stranger to psychoanalysis and ask him how he explains these occurrences.

His first answer is sure to be, "Oh, they are not worth an explanation; they are merely slight accidents." What does he mean by this? Does he mean to assert that there are any occurrences so insignificant that they fall out of the causal sequence of things, or that they might just as well be something different from what they are? If any one thus denies the determination of natural phenomena at one such point, he has vitiated the entire scientific viewpoint. One can then point out to him how much more consistent is the religious point of view, when it explicitly asserts that "No sparrow falls from the roof without God's special wish." I imagine our friend will not be willing to follow his first answer to its logical conclusion; he will interrupt and say that if he were to study these things he would probably find an explanation for them. He will say that this is a case of slight functional disturbance, of an inaccurate psychic act whose causal factors can be outlined. A man who otherwise speaks correctly may make a slip of the tongue — when he is slightly ill or fatigued; when he is excited; when his attention is concentrated on something else. It is easy to prove these statements. Slips of the tongue do really occur with special frequency when one is tired, when one has a headache or when one is indisposed. Forgetting proper names is a very frequent occurrence under these circumstances. Many persons even recognize the imminence of an indisposition by the inability to recall proper names. Often also one mixes up words or objects during excitement, one picks up the wrong things; and the forgetting of projects, as well as the doing of any number of other unintentional acts, becomes conspicuous when one is distracted; in other words, when one's attention is concentrated on other things. A familiar instance of such distraction is the professor in *Fliegende Blätter*, who takes the wrong hat because he is thinking of the problems which he wishes to treat in his next book. Each of us knows from experience some

examples of how one can forget projects which one has planned and promises which one has made, because an experience has intervened which has preoccupied one deeply.

This seems both comprehensible and irrefutable. It is perhaps not very interesting, not as we expected it to be. But let us consider this explanation of errors. The conditions which have been cited as necessary for the occurrence of these phenomena are not all identical. Illness and disorders of circulation afford a physiological basis. Excitement, fatigue and distraction are conditions of a different sort, which one could designate as psycho-physiological. About these latter it is easy to theorize. Fatigue, as well as distraction, and perhaps also general excitement, cause a scattering of the attention which can result in the act in progress not receiving sufficient attention. This act can then be more easily interrupted than usual, and may be inexactly carried out. A slight illness, or a change in the distribution of blood in the central organ of the nervous system, can have the same effect, inasmuch as it influences the determining factor, the distribution of attention, in a similar way. In all cases, therefore, it is a question of the effects of a distraction of the attention, caused either by organic or psychic factors.

But this does not seem to yield much of interest for our psychoanalytic investigation. We might even feel tempted to give up the subject. To be sure, when we look more closely we find that not everything squares with this attention theory of psychological errors, or that at any rate not everything can be directly deduced from it. We find that such errors and such forgetting occur even when people are not fatigued, distracted or excited, but are in every way in their normal state; unless, in consequence of these errors, one were to attribute to them an excitement which they themselves do not acknowledge. Nor is the mechanism so simple that the success of an act is assured by an intensification of the attention bestowed upon it, and endangered by its diminution. There are many acts which one performs in a purely automatic way and with very little attention, but which are yet carried out quite successfully. The pedestrian who scarcely knows where he is going, nevertheless keeps to the right road and stops at his destination without having gone astray. At least, this is the rule. The practiced pianist touches the right keys without thinking of them. He may, of course, also make an occasional mistake, but if automatic playing increased the likelihood of errors, it would be just the virtuoso whose

playing has, through practice, become most automatic, who would be the most exposed to this danger. Yet we see, on the contrary, that many acts are most successfully carried out when they are not the objects of particularly concentrated attention, and that the mistakes occur just at the point where one is most anxious to be accurate — where a distraction of the necessary attention is therefore surely least permissible. One could then say that this is the effect of the "excitement," but we do not understand why the excitement does not intensify the concentration of attention on the goal that is so much desired. If in an important speech or discussion anyone says the opposite of what he means, then that can hardly be explained according to the psycho-physiological or the attention theories.

There are also many other small phenomena accompanying these errors, which are not understood and which have not been rendered comprehensible to us by these explanations. For instance, when one has temporarily forgotten a name, one is annoyed, one is determined to recall it and is unable to give up the attempt. Why is it that despite his annoyance the individual cannot succeed, as he wishes, in directing his attention to the word which is "on the tip of his tongue," and which he instantly recognizes when it is pronounced to him? Or, to take another example, there are cases in which the errors multiply, link themselves together, substitute for each other. The first time one forgets an appointment; the next time, after having made a special resolution not to forget it, one discovers that one has made a mistake in the day or hour. Or one tries by devious means to remember a forgotten word, and in the course of so doing loses track of a second name which would have been of use in finding the first. If one then pursues this second name, a third gets lost, and so on. It is notorious that the same thing can happen in the case of misprints, which are of course to be considered as errors of the typesetter. A stubborn error of this sort is said to have crept into a Social-Democratic paper, where, in the account of a certain festivity was printed, "Among those present was His Highness, the Clown Prince." The next day a correction was attempted. The paper apologized and said, "The sentence should, of course, have read 'The Clown Prince.'" One likes to attribute these occurrences to the printer's devil, to the goblin of the typesetting machine, and the like — figurative expressions which at least go beyond a psycho-physiological theory of the misprint.

I do not know if you are acquainted with the fact that one can provoke slips of the tongue, can call them forth by suggestion, as it were. An anecdote will serve to illustrate this. Once when a novice on the stage was entrusted with the important role in *The Maid of Orleans* of announcing to the King, “Connétable sheathes his sword,” the star played the joke of repeating to the frightened beginner during the rehearsal, instead of the text, the following, “Comfortable sends back his steed,” and he attained his end. In the performance the unfortunate actor actually made his début with this distorted announcement; even after he had been amply warned against so doing, or perhaps just for that reason.

These little characteristics of errors are not exactly illuminated by the theory of diverted attention. But that does not necessarily prove the whole theory wrong. There is perhaps something missing, a complement by the addition of which the theory would be made completely satisfactory. But many of the errors themselves can be regarded from another aspect.

Let us select slips of the tongue, as best suited to our purposes. We might equally well choose slips of the pen or of reading. But at this point, we must make clear to ourselves the fact that so far we have inquired only as to when and under what conditions one’s tongue slips, and have received an answer on this point only. One can, however, direct one’s interest elsewhere and ask why one makes just this particular slip and no other; one can consider what the slip results in. You must realize that as long as one does not answer this question — does not explain the effect produced by the slip — the phenomenon in its psychological aspect remains an accident, even if its physiological explanation has been found. When it happens that I commit a slip of the tongue, I could obviously make any one of an infinite number of slips, and in place of the one right word say any one of a thousand others, make innumerable distortions of the right word. Now, is there anything which forces upon me in a specific instance just this one special slip out of all those which are possible, or does that remain accidental and arbitrary, and can nothing rational be found in answer to this question?

Two authors, Meringer and Mayer (a philologist and a psychiatrist) did indeed in 1895 make the attempt to approach the problem of slips of the tongue from this side. They collected examples and first treated them from a purely descriptive standpoint. That, of course, does not yet furnish any explanation, but may open the way to one. They differentiated the

distortions which the intended phrase suffered through the slip, into: interchanges of positions of words, interchanges of parts of words, perseverations, compoundings and substitutions. I will give you examples of these authors' main categories. It is a case of interchange of the first sort if someone says "the Milo of Venus" instead of "the Venus of Milo." An example of the second type of interchange, "I had a blush of rood to the head" instead of "rush of blood"; a perseveration would be the familiar misplaced toast, "I ask you to join me in hiccoughing the health of our chief." These three forms of slips are not very frequent. You will find those cases much more frequent in which the slip results from a drawing together or compounding of syllables; for example, a gentleman on the street addresses a lady with the words, "If you will allow me, madame, I should be very glad to *inscort* you." In the compounded word there is obviously besides the word "escort," also the word "insult" (and parenthetically we may remark that the young man will not find much favor with the lady). As an example of the substitution, Meringer and Mayer cite the following: "A man says, 'I put the specimens in the letterbox,' instead of 'in the hot-bed,' and the like."

The explanation which the two authors attempt to formulate on the basis of this collection of examples is peculiarly inadequate. They hold that the sounds and syllables of words have different values, and that the production and perception of more highly valued syllables can interfere with those of lower values. They obviously base this conclusion on the cases of fore-sounding and perseveration which are not at all frequent; in other cases of slips of the tongue the question of such sound priorities, if any exist, does not enter at all. The most frequent cases of slips of the tongue are those in which instead of a certain word one says another which resembles it; and one may consider this resemblance sufficient explanation. For example, a professor says in his initial lecture, "I am not *inclined* to evaluate the merits of my predecessor." Or another professor says, "In the case of the female genital, despite many *temptations* ... I mean many attempts ... etc."

The most common, and also the most conspicuous form of slips of the tongue, however, is that of saying the exact opposite of what one meant to say. In such cases, one goes far afield from the problem of sound relations and resemblance effects, and can cite, instead of these, the fact that opposites have an obviously close relationship to each other, and have

particularly close relations in the psychology of association. There are historical examples of this sort. A president of our House of Representatives once opened the assembly with the words, “Gentlemen, I declare a quorum present, and herewith declare the assembly *closed*.”

Similar, in its trickiness, to the relation of opposites is the effect of any other facile association which may under certain circumstances arise most inopportunely. Thus, for instance, there is the story which relates that on the occasion of a festivity in honor of the marriage of a child of H. Helmholtz with a child of the well-known discoverer and captain of industry, W. Siemon, the famous physiologist Dubois-Reymond was asked to speak. He concluded his undoubtedly sparkling toast with the words, “Success to the new firm — Siemens and — Halski!” That, of course, was the name of the well-known old firm. The association of the two names must have been about as easy for a native of Berlin as “Weber and Fields” to an American.

Thus we must add to the sound relations and word resemblances the influence of word associations. But that is not all. In a series of cases, an explanation of the observed slip is unsuccessful unless we take into account what phrase had been said or even thought previously. This again makes it a case of perseveration of the sort stressed by Meringer, but of a longer duration. I must admit, I am on the whole of the impression that we are further than ever from an explanation of slips of the tongue!

However, I hope I am not wrong when I say that during the above investigation of these examples of slips of the tongue, we have all obtained a new impression on which it will be of value to dwell. We sought the general conditions under which slips of the tongue occur, and then the influences which determine the kind of distortion resulting from the slip, but we have in no way yet considered the effect of the slip of the tongue in itself, without regard to its origin. And if we should decide to do so we must finally have the courage to assert, “In some of the examples cited, the product of the slip also makes sense.” What do we mean by “it makes sense”? It means, I think, that the product of the slip has itself a right to be considered as a valid psychic act which also has its purpose, as a manifestation having content and meaning. Hitherto we have always spoken of errors, but now it seems as if sometimes the error itself were quite a normal act, except that it has thrust itself into the place of some other expected or intended act.

In isolated cases this valid meaning seems obvious and unmistakable. When the president with his opening words closes the session of the House of Representatives, instead of opening it, we are inclined to consider this error meaningful by reason of our knowledge of the circumstances under which the slip occurred. He expects no good of the assembly, and would be glad if he could terminate it immediately. The pointing out of this meaning, the interpretation of this error, gives us no difficulty. Or a lady, pretending to admire, says to another, “I am sure you must have messed up this charming hat yourself.” No scientific quibbles in the world can keep us from discovering in this slip the idea “this hat is a mess.” Or a lady who is known for her energetic disposition, relates, “My husband asked the doctor to what diet he should keep. But the doctor said he didn’t need any diet, he should eat and drink whatever *I* want.” This slip of tongue is quite an unmistakable expression of a consistent purpose.

Ladies and gentlemen, if it should turn out that not only a few cases of slips of the tongue and of errors in general, but the larger part of them, have a meaning, then this meaning of errors of which we have hitherto made no mention, will unavoidably become of the greatest interest to us and will, with justice, force all other points of view into the background. We could then ignore all physiological and psycho-physiological conditions and devote ourselves to the purely psychological investigations of the sense, that is, the meaning, the purpose of these errors. To this end therefore we will not fail, shortly, to study a more extensive compilation of material.

But before we undertake this task, I should like to invite you to follow another line of thought with me. It has repeatedly happened that a poet has made use of slips of the tongue or some other error as a means of poetic presentation. This fact in itself must prove to us that he considers the error, the slip of the tongue for instance, as meaningful; for he creates it on purpose, and it is not a case of the poet committing an accidental slip of the pen and then letting his pen-slip stand as a tongue-slip of his character. He wants to make something clear to us by this slip of the tongue, and we may examine what it is, whether he wishes to indicate by this that the person in question is distracted or fatigued. Of course, we do not wish to exaggerate the importance of the fact that the poet did make use of a slip to express his meaning. It could nevertheless really be a psychic accident, or meaningful only in very rare cases, and the poet would still retain the

right to infuse it with meaning through his setting. As to their poetic use, however, it would not be surprising if we should glean more information concerning slips of the tongue from the poet than from the philologist or the psychiatrist.

Such an example of a slip of the tongue occurs in *Wallenstein* (*Piccolomini*, Act 1, Scene 5). In the previous scene, Max Piccolomini has most passionately sided with the Herzog, and dilated ardently on the blessings of peace which disclosed themselves to him during the trip on which he accompanied Wallenstein's daughter to the camp. He leaves his father and the courtier, Questenberg, plunged in deepest consternation. And then the fifth scene continues:

Q.

Alas! Alas! and stands it so?
What friend! and do we let him go away
In this delusion — let him go away?
Not call him back immediately, not open
His eyes upon the spot?

OCTAVIO.

(*Recovering himself out of a deep study*)
He has now opened mine,
And I see more than pleases me.

Q.

What is it?

OCTAVIO.

A curse on this journey!

Q.

But why so? What is it?

OCTAVIO.

Come, come along, friend! I must follow up
The ominous track immediately. Mine eyes
Are opened now, and I must use them. Come!
(*Draws Q. on with him.*)

Q.

What now? Where go you then?

OCTAVIO.

(*Hastily.*) To *her* herself

Q.

To —

OCTAVIO.

(*Interrupting him and correcting himself.*)
To the duke. Come, let us go — .

Octavio meant to say, “To him, to the lord,” but his tongue slips and through his words “*to her*” he betrays to us, at least, the fact that he had quite clearly recognized the influence which makes the young war hero dream of peace.

A still more impressive example was found by O. Rank in Shakespeare. It occurs in the *Merchant of Venice*, in the famous scene in which the fortunate suitor makes his choice among the three caskets; and perhaps I can do no better than to read to you here Rank’s short account of the incident:

“A slip of the tongue which occurs in Shakespeare’s *Merchant of Venice*, Act III, Scene II, is exceedingly delicate in its poetic motivation and technically brilliant in its handling. Like the slip in *Wallenstein* quoted by Freud (*Psychopathology of Everyday Life*, 2d ed.,), it shows that the

poets well know the meaning of these errors and assume their comprehensibility to the audience. Portia, who by her father's wish has been bound to the choice of a husband by lot, has so far escaped all her unfavored suitors through the fortunes of chance. Since she has finally found in Bassanio the suitor to whom she is attached, she fears that he, too, will choose the wrong casket. She would like to tell him that even in that event he may rest assured of her love, but is prevented from so doing by her oath. In this inner conflict the poet makes her say to the welcome suitor:

PORTIA:

I pray you tarry; pause a day or two,
Before you hazard; for, in choosing wrong
I lose your company; therefore, forbear a while:
There's something tells me, (but it is not love)
I would not lose you: * * *
* * * I could teach you
How to choose right, but then I am forsworn,
So will I never be: so may you miss me;
But if you do, you'll make me wish a sin
That I had been forsworn. Beshrew your eyes.
They have o'erlook'd me, and divided me;
One half of me is yours, the other half

yours,
Mine own, I would say: but if mine, then yours,
And so all yours.

Just that, therefore, which she meant merely to indicate faintly to him or really to conceal from him entirely, namely that even before the choice of the lot she was his and loved him, this the poet — with admirable psychological delicacy of feeling — makes apparent by her slip; and is able, by this artistic device, to quiet the unbearable uncertainty of the lover, as well as the equal suspense of the audience as to the issue of the choice."

Notice, at the end, how subtly Portia reconciles the two declarations which are contained in the slip, how she resolves the contradiction between them and finally still manages to keep her promise:

"* * * but if mine, then yours,
And so all yours."

Another thinker, alien to the field of medicine, accidentally disclosed the meaning of errors by an observation which has anticipated our attempts at explanation. You all know the clever satires of Lichtenberg (1742-1749), of which Goethe said, "Where he jokes, there lurks a problem concealed." Not infrequently the joke also brings to light the solution of the problem. Lichtenberg mentions in his jokes and satiric comments the remark that he always read "Agamemnon" for "angenommen," so intently had he read Homer. Herein is really contained the whole theory of misreadings.

At the next session we will see whether we can agree with the poets in their conception of the meaning of psychological errors.

THIRD LECTURE. THE PSYCHOLOGY OF ERRORS — (Continued)

AT the last session we conceived the idea of considering the error, not in its relation to the intended act which it distorted, but by itself alone, and we received the impression that in isolated instances it seems to betray a meaning of its own. We declared that if this fact could be established on a larger scale, then the meaning of the error itself would soon come to interest us more than an investigation of the circumstances under which the error occurs.

Let us agree once more on what we understand by the “meaning” of a psychic process. A psychic process is nothing more than the purpose which it serves and the position which it holds in a psychic sequence. We can also substitute the word “purpose” or “intention” for “meaning” in most of our investigations. Was it then only a deceptive appearance or a poetic exaggeration of the importance of an error which made us believe that we recognized a purpose in it?

Let us adhere faithfully to the illustrative example of slips of the tongue and let us examine a larger number of such observations. We then find whole categories of cases in which the intention, the meaning of the slip itself, is clearly manifest. This is the case above all in those examples in which one says the opposite of what one intended. The president said, in his opening address, “I declare the meeting closed.” His intention is certainly not ambiguous. The meaning and purpose of his slip is that he wants to terminate the meeting. One might point the conclusion with the remark “he said so himself.” We have only taken him at his word. Do not interrupt me at this point by remarking that this is not possible, that we know he did not want to terminate the meeting but to open it, and that he himself, whom we have just recognized as the best judge of his intention, will affirm that he meant to open it. In so doing you forget that we have agreed to consider the error entirely by itself. Its relation to the intention which it distorts is to be discussed later. Otherwise you convict yourself of an error in logic by which you smoothly conjure away the problem under discussion; or “beg the question,” as it is called in English.

In other cases in which the speaker has not said the exact opposite of what he intended, the slip may nevertheless express an antithetical

meaning. “I am not *inclined* to appreciate the merits of my predecessor.” “*Inclined*” is not the opposite of “*in a position to*,” but it is an open betrayal of intent in sharpest contradiction to the attempt to cope gracefully with the situation which the speaker is supposed to meet.

In still other cases the slip simply adds a second meaning to the one intended. The sentence then sounds like a contradiction, an abbreviation, a condensation of several sentences. Thus the lady of energetic disposition, “He may eat and drink whatever *I* please.” The real meaning of this abbreviation is as though the lady had said, “He may eat and drink whatever he pleases. But what does it matter what *he* pleases! It is *I* who do the pleasing.” Slips of the tongue often give the impression of such an abbreviation. For example, the anatomy professor, after his lecture on the human nostril, asks whether the class has thoroughly understood, and after a unanimous answer in the affirmative, goes on to say: “I can hardly believe that is so, since the people who understand the human nostril can, even in a city of millions, be counted on *one finger* — I mean, on the fingers of one hand.” The abbreviated sentence here also has its meaning: it expresses the idea that there is only one person who thoroughly understands the subject.

In contrast to these groups of cases are those in which the error does not itself express its meaning, in which the slip of the tongue does not in itself convey anything intelligible; cases, therefore, which are in sharpest opposition to our expectations. If anyone, through a slip of the tongue, distorts a proper name, or puts together an unusual combination of syllables, then this very common occurrence seems already to have decided in the negative the question of whether all errors contain a meaning. Yet closer inspection of these examples discloses the fact that an understanding of such a distortion is easily possible, indeed, that the difference between these unintelligible cases and the previous comprehensible ones is not so very great.

A man who was asked how his horse was, answered, “Oh, it may *stake* — it may take another month.” When asked what he really meant to say, he explained that he had been thinking that it was a *sorry* business and the coming together of “*take*” and “*sorry*” gave rise to “*stake*.” (Meringer and Mayer.)

Another man was telling of some incidents to which he had objected, and went on, “and then certain facts were *re-filed*.” Upon being

questioned, he explained that he meant to stigmatize these facts as "*filthy*." "*Revealed*" and "*filthy*" together produced the peculiar "*re-filled*." (Meringer and Mayer.)

You will recall the case of the young man who wished to "*inscort*" an unknown lady. We took the liberty of resolving this word construction into the two words "*escort*" and "*insult*," and felt convinced of this interpretation without demanding proof of it. You see from these examples that even slips can be explained through the concurrence, the interference, of two speeches of different intentions. The difference arises only from the fact that in the one type of slip the intended speech completely crowds out the other, as happens in those slips where the opposite is said, while in the other type the intended speech must rest content with so distorting or modifying the other as to result in mixtures which seem more or less intelligible in themselves.

We believe that we have now grasped the secret of a large number of slips of the tongue. If we keep this explanation in mind we will be able to understand still other hitherto mysterious groups. In the case of the distortion of names, for instance, we cannot assume that it is always an instance of competition between two similar, yet different names. Still, the second intention is not difficult to guess. The distorting of names occurs frequently enough not as a slip of the tongue, but as an attempt to give the name an ill-sounding or debasing character. It is a familiar device or trick of insult, which persons of culture early learned to do without, though they do not give it up readily. They often clothe it in the form of a joke, though, to be sure, the joke is of a very low order. Just to cite a gross and ugly example of such a distortion of a name, I mention the fact that the name of the President of the French Republic, *Poincaré*, has been at times, lately, transformed into "*Schweinskarré*." It is therefore easy to assume that there is also such an intention to insult in the case of other slips of the tongue which result in the distortion of a name. In consequence of our adherence to this conception, similar explanations force themselves upon us, in the case of slips of the tongue whose effect is comical or absurd. "I call upon you to *hiccough* the health of our chief." Here the solemn atmosphere is unexpectedly disturbed by the introduction of a word that awakens an unpleasant image; and from the prototype of certain expressions of insult and offense we cannot but suppose that there is an intention striving for expression which is in sharp contrast to the ostensible respect, and which

could be expressed about as follows, “You needn’t believe this. I’m not really in earnest. I don’t give a whoop for the fellow — etc.” A similar trick which passes for a slip of the tongue is that which transforms a harmless word into one which is indecent and obscene.

We know that many persons have this tendency of intentionally making harmless words obscene for the sake of a certain lascivious pleasure it gives them. It passes as wit, and we always have to ask about a person of whom we hear such a thing, whether he intended it as a joke or whether it occurred as a slip of the tongue.

Well, here we have solved the riddle of errors with relatively little trouble! They are not accidents, but valid psychic acts. They have their meaning; they arise through the collaboration — or better, the mutual interference — of two different intentions. I can well understand that at this point you want to swamp me with a deluge of questions and doubts to be answered and resolved before we can rejoice over this first result of our labors. I truly do not wish to push you to premature conclusions. Let us dispassionately weigh each thing in turn, one after the other.

What would you like to say? Whether I think this explanation is valid for all cases of slips of the tongue or only for a certain number? Whether one can extend this same conception to all the many other errors — to mis-reading, slips of the pen, forgetting, picking up the wrong object, mislaying things, etc? In the face of the psychic nature of errors, what meaning is left to the factors of fatigue, excitement, absent-mindedness and distraction of attention? Moreover, it is easy to see that of the two competing meanings in an error, one is always public, but the other not always. But what does one do in order to guess the latter? And when one believes one has guessed it, how does one go about proving that it is not merely a probable meaning, but that it is the only correct meaning? Is there anything else you wish to ask? If not, then I will continue. I would remind you of the fact that we really are not much concerned with the errors themselves, but we wanted only to learn something of value to psychoanalysis from their study. Therefore, I put the question: What are these purposes or tendencies which can thus interfere with others, and what relation is there between the interfering tendencies and those interfered with? Thus our labor really begins anew, after the explanation of the problem.

Now, is this the explanation of all tongue slips? I am very much inclined to think so and for this reason, that as often as one investigates a case of a slip of the tongue, it reduces itself to this type of explanation. But on the other hand, one cannot prove that a slip of the tongue cannot occur without this mechanism. It may be so; for our purposes it is a matter of theoretical indifference, since the conclusions which we wish to draw by way of an introduction to psychoanalysis remain untouched, even if only a minority of the cases of tongue slips come within our conception, which is surely not the case. I shall anticipate the next question, of whether or not we may extend to other types of errors what we have gleaned from slips of the tongue, and answer it in the affirmative. You will convince yourselves of that conclusion when we turn our attention to the investigation of examples of pen slips, picking up wrong objects, etc. I would advise you, however, for technical reasons, to postpone this task until we shall have investigated the tongue slip itself more thoroughly.

The question of what meaning those factors which have been placed in the foreground by some authors, — namely, the factors of circulatory disturbances, fatigue, excitement, absent-mindedness, the theory of the distraction of attention — the question of what meaning those factors can now have for us if we accept the above described psychic mechanism of tongue slips, deserves a more detailed answer. You will note that we do not deny these factors. In fact, it is not very often that psychoanalysis denies anything which is asserted on the other side. As a rule psychoanalysis merely adds something to such assertions and occasionally it does happen that what had hitherto been overlooked, and was newly added by psychoanalysis, is just the essential thing. The influence on the occurrence of tongue slips of such physiological predispositions as result from slight illness, circulatory disturbances and conditions of fatigue, should be acknowledged without more ado. Daily personal experience can convince you of that. But how little is explained by such an admission! Above all, they are not necessary conditions of the errors. Slips of the tongue are just as possible when one is in perfect health and normal condition. Bodily factors, therefore, have only the value of acting by way of facilitation and encouragement to the peculiar psychic mechanism of a slip of the tongue.

To illustrate this relationship, I once used a simile which I will now repeat because I know of no better one as substitute. Let us suppose that some dark night I go past a lonely spot and am there assaulted by a rascal

who takes my watch and purse; and then, since I did not see the face of the robber clearly, I make my complaint at the nearest police station in the following words: “Loneliness and darkness have just robbed me of my valuables.” The police commissioner could then say to me: “You seem to hold an unjustifiably extreme mechanistic conception. Let us rather state the case as follows: Under cover of darkness, and favored by the loneliness, an unknown robber seized your valuables. The essential task in your case seems to me to be to discover the robber. Perhaps we can then take his booty from him again.”

Such psycho-physiological moments as excitement, absent-mindedness and distracted attention, are obviously of small assistance to us for the purpose of explanation. They are mere phrases, screens behind which we will not be deterred from looking. The question is rather what in such cases has caused the excitement, the particular diversion of attention. The influence of syllable sounds, word resemblances and the customary associations which words arouse should also be recognized as having significance. They facilitate the tongue slip by pointing the path which it can take. But if I have a path before me, does that fact as a matter of course determine that I will follow it? After all, I must have a stimulus to make me decide for it, and, in addition, a force which carries me forward on this path. These sound and word relationships therefore serve also only to facilitate the tongue slip, just as the bodily dispositions facilitate them; they cannot give the explanation for the word itself. Just consider, for example, the fact that in an enormously large number of cases, my lecturing is not disturbed by the fact that the words which I use recall others by their sound resemblance, that they are intimately associated with their opposites, or arouse common associations. We might add here the observation of the philosopher Wundt, that slips of the tongue occur when, in consequence of bodily fatigue, the tendency to association gains the upper hand over the intended speech. This would sound very plausible if it were not contradicted by experiences which proved that from one series of cases of tongue-slips bodily stimuli were absent, and from another, the association stimuli were absent.

However, your next question is one of particular interest to me, namely: in what way can one establish the existence of the two mutually antagonistic tendencies? You probably do not suspect how significant this question is. It is true, is it not, that one of the two tendencies, the tendency

which suffers the interference, is always unmistakable? The person who commits the error is aware of it and acknowledges it. It is the other tendency, what we call the interfering tendency, which causes doubt and hesitation. Now we have already learned, and you have surely not forgotten, that these tendencies are, in a series of cases, equally plain. That is indicated by the effect of the slip, if only we have the courage to let this effect be valid in itself. The president who said the opposite of what he meant to say made it clear that he wanted to open the meeting, but equally clear that he would also have liked to terminate it. Here the meaning is so plain that there is nothing left to be interpreted. But the other cases in which the interfering tendency merely distorts the original, without bringing itself to full expression — how can one guess the interfering meaning from the distortion?

By a very sure and simple method, in the first series of cases, namely, by the same method by which one establishes the existence of the meaning interfered with. The latter is immediately supplied by the speaker, who instantly adds the originally intended expression. “It may *stake* — no, it may *take* another month.” Now we likewise ask him to express the interfering meaning; we ask him: “Now, why did you first say *stake*?” He answers, “I meant to say— ‘This is a *sorry* business.’” And in the other case of the tongue slip — *re-filed* — the subject also affirms that he meant to say “It is a *fil-thy* business,” but then moderated his expression and turned it into something else. Thus the discovery of the interfering meaning was here as successful as the discovery of the one interfered with. Nor did I unintentionally select as examples cases which were neither related nor explained by me or by a supporter of my theories. Yet a certain investigation was necessary in both cases in order to obtain the solution. One had to ask the speaker why he made this slip, what he had to say about it. Otherwise he might perhaps have passed it by without seeking to explain it. When questioned, however, he furnished the explanation by means of the first thing that came to his mind. And now you see, ladies and gentlemen, that this slight investigation and its consequence are already a psychoanalysis, and the prototype of every psychoanalytic investigation which we shall conduct more extensively at a later time.

Now, am I unduly suspicious if I suspect that at the same moment in which psychoanalysis emerges before you, your resistance to psychoanalysis also raises its head? Are you not anxious to raise the

objection that the information given by the subject we questioned, and who committed the slip, is not proof sufficient? He naturally has the desire, you say, to meet the challenge, to explain the slip, and hence he says the first thing he can think of if it seems relevant. But that, you say, is no proof that this is really the way the slip happened. It might be so, but it might just as well be otherwise, you say. Something else might have occurred to him which might have fitted the case just as well and better.

It is remarkable how little respect, at bottom, you have for a psychic fact! Imagine that someone has decided to undertake the chemical analysis of a certain substance, and has secured a sample of the substance, of a certain weight — so and so many milligrams. From this weighed sample certain definite conclusions can be drawn. Do you think it would ever occur to a chemist to discredit these conclusions by the argument that the isolated substance might have had some other weight? Everyone yields to the fact that it was just this weight and no other, and confidently builds his further conclusions upon that fact. But when you are confronted by the psychic fact that the subject, when questioned, had a certain idea, you will not accept that as valid, but say some other idea might just as easily have occurred to him! The trouble is that you believe in the illusion of psychic freedom and will not give it up. I regret that on this point I find myself in complete opposition to your views.

Now you will relinquish this point only to take up your resistance at another place. You will continue, “We understand that it is the peculiar technique of psychoanalysis that the solution of its problems is discovered by the analyzed subject himself. Let us take another example, that in which the speaker calls upon the assembly ‘to *hiccough* the health of their chief.’ The interfering idea in this case, you say, is the insult. It is that which is the antagonist of the expression of conferring an honor. But that is mere interpretation on your part, based on observations extraneous to the slip. If in this case you question the originator of the slip, he will not affirm that he intended an insult, on the contrary, he will deny it energetically. Why do you not give up your unverifiable interpretation in the face of this plain objection?”

Yes, this time you struck a hard problem. I can imagine the unknown speaker. He is probably an assistant to the guest of honor, perhaps already a minor official, a young man with the brightest prospects. I will press him as to whether he did not after all feel conscious of something which may

have worked in opposition to the demand that he do honor to the chief. What a fine success I'll have! He becomes impatient and suddenly bursts out on me, "Look here, you'd better stop this cross-examination, or I'll get unpleasant. Why, you'll spoil my whole career with your suspicions. I simply said '*auf*-gestossen' instead of '*an*-gestossen,' because I'd already said '*auf*' twice in the same sentence. It's the thing that Meringer calls a perservation, and there's no other meaning that you can twist out of it. Do you understand me? That's all." H'm, this is a surprising reaction, a really energetic denial. I see that there is nothing more to be obtained from the young man, but I also remark to myself that he betrays a strong personal interest in having his slip mean nothing. Perhaps you, too, agree that it is not right for him immediately to become so rude over a purely theoretical investigation, but, you will conclude, he really must know what he did and did not mean to say.

Really? Perhaps that's open to question nevertheless.

But now you think you have me. "So that is your technique," I hear you say. "When the person who has committed a slip gives an explanation which fits your theory, then you declare him the final authority on the subject. 'He says so himself!' But if what he says does not fit into your scheme, then you suddenly assert that what he says does not count, that one need not believe him."

Yet that is certainly true. I can give you a similar case in which the procedure is apparently just as monstrous. When a defendant confesses to a deed, the judge believes his confession. But if he denies it, the judge does not believe him. Were it otherwise, there would be no way to administer the law, and despite occasional miscarriages you must acknowledge the value of this system.

Well, are you then the judge, and is the person who committed the slip a defendant before you? Is a slip of the tongue a crime?

Perhaps we need not even decline this comparison. But just see to what far-reaching differences we have come by penetrating somewhat into the seemingly harmless problems of the psychology of errors, differences which at this stage we do not at all know how to reconcile. I offer you a preliminary compromise on the basis of the analogy of the judge and the defendant. You will grant me that the meaning of an error admits of no doubt when the subject under analysis acknowledges it himself. I in turn will admit that a direct proof for the suspected meaning cannot be

obtained if the subject denies us the information; and, of course, that is also the case when the subject is not present to give us the information. We are, then, as in the case of the legal procedure, dependent on circumstances which make a decision at one time seem more, and at another time, less probable to us. At law, one has to declare a defendant guilty on circumstantial evidence for practical reasons. We see no such necessity; but neither are we forced to forego the use of these circumstances. It would be a mistake to believe that a science consists of nothing but conclusively proved theorems, and any such demand would be unjust. Only a person with a mania for authority, a person who must replace his religious catechism with some other, even though it be scientific, would make such a demand. Science has but few apodeictic precepts in its catechism; it consists chiefly of assertions which it has developed to certain degrees of probability. It is actually a symptom of scientific thinking if one is content with these approximations of certainty and is able to carry on constructive work despite the lack of the final confirmation.

But where do we get the facts for our interpretations, the circumstances for our proof, when the further remarks of the subject under analysis do not themselves elucidate the meaning of the error? From many sources. First of all, from the analogy with phenomena extraneous to the psychology of errors; as, for example, when we assert that the distortion of a name as a slip of the tongue has the same insulting significance as an intentional name distortion. We get them also from the psychic situation in which the error occurred, from our knowledge of the character of the person who committed the error, from the impressions which that person received before making the error, and to which he may possibly have reacted with this error. As a rule, what happens is that we find the meaning of the error according to general principles. It is then only a conjecture, a suggestion as to what the meaning may be, and we then obtain our proof from examination of the psychic situation. Sometimes, too, it happens that we have to wait for subsequent developments, which have announced themselves, as it were, through the error, in order to find our conjecture verified.

I cannot easily give you proof of this if I have to limit myself to the field of tongue slips, although even here there are a few good examples. The young man who wished to “*inscort*” the lady is certainly shy; the lady

whose husband may eat and drink whatever *she* wants I know to be one of those energetic women who know how to rule in the home. Or take the following case: At a general meeting of the Concordia Club, a young member delivers a vehement speech in opposition, in the course of which he addresses the officers of the society as: “Fellow committee lenders.” We will conjecture that some conflicting idea militated in him against his opposition, an idea which was in some way based on a connection with money lending. As a matter of fact, we learn from our informant that the speaker was in constant money difficulties, and had attempted to raise a loan. As a conflicting idea, therefore, we may safely interpolate the idea, “Be more moderate in your opposition, these are the same people who are to grant you the loan.”

But I can give you a wide selection of such circumstantial proof if I delve into the wide field of other kinds of error.

If anyone forgets an otherwise familiar proper name, or has difficulty in retaining it in his memory despite all efforts, then the conclusion lies close at hand, that he has something against the bearer of this name and does not like to think of him. Consider in this connection the following revelation of the psychic situation in which this error occurs:

“A Mr. Y. fell in love, without reciprocation, with a lady who soon after married a Mr. X. In spite of the fact that Mr. Y. has known Mr. X. a long time, and even has business relations with him, he forgets his name over and over again, so that he found it necessary on several occasions to ask other people the man’s name when he wanted to write to Mr. X.”

Mr. Y. obviously does not want to have his fortunate rival in mind under any condition. “Let him never be thought of.”

Another example: A lady makes inquiries at her doctor’s concerning a mutual acquaintance, but speaks of her by her maiden name. She has forgotten her married name. She admits that she was much displeased by the marriage, and could not stand this friend’s husband.

Later we shall have much to say in other relations about the matter of forgetting names. At present we are predominantly interested in the psychic situation in which the lapse of memory occurs.

The forgetting of projects can quite commonly be traced to an antagonistic current which does not wish to carry out the project. We psychoanalysts are not alone in holding this view, but this is the general conception to which all persons subscribe the daily affairs, and which they

first deny in theory. The patron who makes apologies to his protegé, saying that he has forgotten his requests, has not squared himself with his protegé. The protegé immediately thinks: “There’s nothing to that; he did promise but he really doesn’t want to do it.” Hence, daily life also proscribes forgetting, in certain connections, and the difference between the popular and the psychoanalytic conception of these errors appears to be removed. Imagine a housekeeper who receives her guest with the words: “What, you come to-day? Why, I had totally forgotten that I had invited you for to-day”; or the young man who might tell his sweetheart that he had forgotten to keep the rendezvous which they planned. He is sure not to admit it, it were better for him to invent the most improbable excuses on the spur of the moment, hindrances which prevented him from coming at that time, and which made it impossible for him to communicate the situation to her. We all know that in military matters the excuse of having forgotten something is useless, that it protects one from no punishment; and we must consider this attitude justified. Here we suddenly find everyone agreed that a certain error is significant, and everyone agrees what its meaning is. Why are they not consistent enough to extend this insight to the other errors, and fully to acknowledge them? Of course, there is also an answer to this.

If the meaning of this forgetting of projects leaves room for so little doubt among laymen, you will be less surprised to find that poets make use of these errors in the same sense. Those of you who have seen or read Shaw’s *Caesar and Cleopatra* will recall that Caesar, when departing in the last scene, is pursued by the idea that there was something more he intended to do, but that he had forgotten it. Finally he discovers what it is: to take leave of Cleopatra. This small device of the author is meant to ascribe to the great Caesar a superiority which he did not possess, and to which he did not at all aspire. You can learn from historical sources that Caesar had Cleopatra follow him to Rome, and that she was staying there with her little Caesarion when Caesar was murdered, whereupon she fled the city.

The cases of forgetting projects are as a rule so clear that they are of little use for our purpose, i.e., discovering in the psychic situation circumstantial evidence of the meaning of the error. Let us, therefore, turn to a particularly ambiguous and untransparent error, that of losing and mislaying objects. That we ourselves should have a purpose in losing an

object, an accident frequently so painful, will certainly seem incredible to you. But there are many instances similar to the following: A young man loses the pencil which he had liked very much. The day before he had received a letter from his brother-in-law, which concluded with the words, “For the present I have neither the inclination nor the time to be a party to your frivolity and your idleness.” It so happened that the pencil had been a present from this brother-in-law. Without this coincidence we could not, of course, assert that the loss involved any intention to get rid of the gift. Similar cases are numerous. Persons lose objects when they have fallen out with the donors, and no longer wish to be reminded of them. Or again, objects may be lost if one no longer likes the things themselves, and wants to supply oneself with a pretext for substituting other and better things in their stead. Letting a thing fall and break naturally shows the same intention toward that object. Can one consider it accidental when a school child just before his birthday loses, ruins or breaks his belongings, for example his school bag or his watch?

He who has frequently experienced the annoyance of not being able to find something which he has himself put away, will also be unwilling to believe there was any intent behind the loss. And yet the examples are not at all rare in which the attendant circumstances of the mislaying point to a tendency temporarily or permanently to get rid of the object. Perhaps the most beautiful example of this sort is the following: A young man tells me: “A few years ago a misunderstanding arose in my married life. I felt my wife was too cool and even though I willingly acknowledged her excellent qualities, we lived without any tenderness between us. One day she brought me a book which she had thought might interest me. I thanked her for this attention, promised to read the book, put it in a handy place, and couldn’t find it again. Several months passed thus, during which I occasionally remembered this mislaid book and tried in vain to find it. About half a year later my beloved mother, who lived at a distance from us, fell ill. My wife left the house in order to nurse her mother-in-law. The condition of the patient became serious, and gave my wife an opportunity of showing her best side. One evening I came home filled with enthusiasm and gratitude toward my wife. I approached my writing desk, opened a certain drawer with no definite intention but as if with somnambulistic certainty, and the first thing I found is the book so long mislaid.”

With the cessation of the motive, the inability to find the mislaid object also came to an end.

Ladies and gentlemen, I could increase this collection of examples indefinitely. But I do not wish to do so here. In my *Psychopathology of Everyday Life* (first published in 1901), you will find only too many instances for the study of errors.

All these examples demonstrate the same thing repeatedly: namely, they make it seem probable that errors have a meaning, and show how one may guess or establish that meaning from the attendant circumstances. I limit myself to-day because we have confined ourselves to the purpose of profiting in the preparation for psychoanalysis from the study of these phenomena. I must, however, still go into two additional groups of observations, into the accumulated and combined errors and into the confirmation of our interpretations by means of subsequent developments.

The accumulated and combined errors are surely the fine flower of their species. If we were interested only in proving that errors may have a meaning, we would limit ourselves to the accumulated and combined errors in the first place, for here the meaning is unmistakable, even to the dullest intelligence, and can force conviction upon the most critical judgment. The accumulation of manifestations betrays a stubbornness such as could never come about by accident, but which fits closely the idea of design. Finally, the interchange of certain kinds of error with each other shows us what is the important and essential element of the error, not its form or the means of which it avails itself, but the purpose which it serves and which is to be achieved by the most various paths. Thus I will give you a case of repeated forgetting. Jones recounts that he once allowed a letter to lie on his writing desk several days for reasons quite unknown. Finally he made up his mind to mail it; but it was returned from the dead letter office, for he had forgotten to address it. After he had addressed it he took it to the post office, but this time without a stamp. At this point he finally had to admit to himself his aversion against sending the letter at all.

In another case a mistake is combined with mislaying an object. A lady is traveling to Rome with her brother-in-law, a famous artist. The visitor is much fêted by the Germans living in Rome, and receives as a gift, among other things, a gold medal of ancient origin. The lady is vexed by the fact that her brother-in-law does not sufficiently appreciate the beautiful

object. After she leaves her sister and reaches her home, she discovers when unpacking that she has brought with her — how, she does not know — the medal. She immediately informs her brother-in-law of this fact by letter, and gives him notice that she will send the medal back to Rome the next day. But on the following day, the medal has been so cleverly mislaid that it can neither be found nor sent, and at this point it begins to dawn upon the lady that her "absent-mindedness" means, namely, that she wants to keep the object for herself.

I have already given you an example of a combination of forgetfulness and error in which someone first forgot a rendezvous and then, with the firm intention of not forgetting it a second time, appeared at the wrong hour. A quite analogous case was told me from his own experience, by a friend who pursues literary interests in addition to his scientific ones. He said: "A few years ago I accepted the election to the board of a certain literary society, because I hoped that the society could at some time be of use to me in helping obtain the production of my drama, and, despite my lack of interest, I took part in the meetings every Friday. A few months ago I received the assurance of a production in the theatre in F., and since that time it happens regularly that I forget the meetings of that society. When I read your article on these things, I was ashamed of my forgetfulness, reproached myself with the meanness of staying away now that I no longer need these people and determined to be sure not to forget next Friday. I kept reminding myself of this resolution until I carried it out and stood before the door of the meeting room. To my astonishment, it was closed, the meeting was already over; for I had mistaken the day. It was already Saturday."

It would be tempting enough to collect similar observations, but I will go no further; I will let you glance instead upon those cases in which our interpretation has to wait for its proof upon future developments.

The chief condition of these cases is conceivably that the existing psychic situation is unknown to us or inaccessible to our inquiries. At that time our interpretation has only the value of a conjecture to which we ourselves do not wish to grant too much weight. Later, however, something happens which shows us how justified was our interpretation even at that time. I was once the guest of a young married couple and heard the young wife laughingly tell of a recent experience, of how on the day after her return from her honeymoon she had hunted up her unmarried sister again

in order to go shopping with her, as in former times, while her husband went to his business. Suddenly she noticed a gentleman on the other side of the street, and she nudged her sister, saying, “Why look, there goes Mr. K.” She had forgotten that this gentleman was her husband of some weeks’ standing. I shuddered at this tale but did not dare to draw the inference. The little anecdote did not occur to me again until a year later, after this marriage had come to a most unhappy end.

A. Maeder tells of a lady who, the day before her wedding, forgot to try on her wedding dress and to the despair of the dressmaker only remembered it later in the evening. He adds in connection with this forgetfulness the fact that she divorced her husband soon after. I know a lady now divorced from her husband, who, in managing her fortune, frequently signed documents with her maiden name, and this many years before she really resumed it. I know of other women who lost their wedding rings on their honeymoon and also know that the course of the marriage gave a meaning to this accident. And now one more striking example with a better termination. It is said that the marriage of a famous German chemist did not take place because he forgot the hour of the wedding, and instead of going to the church went to the laboratory. He was wise enough to rest satisfied with this one attempt, and died unmarried at a ripe old age.

Perhaps the idea has also come to you that in these cases mistakes have taken the place of the *Omina* or omens of the ancients. Some of the *Omina* really were nothing more than mistakes; for example, when a person stumbled or fell down. Others, to be sure, bore the characteristics of objective occurrences rather than that of subjective acts. But you would not believe how difficult it sometimes is to decide in a specific instance whether the act belongs to the one or the other group. It so frequently knows how to masquerade as a passive experience.

Everyone of us who can look back over a longer or shorter life experience will probably say that he might have spared himself many disappointments and painful surprises if he had found the courage and decision to interpret as omens the little mistakes which he made in his intercourse with people, and to consider them as indications of the intentions which were still being kept secret. As a rule, one does not dare do this. One would feel as though he were again becoming superstitious

via a detour through science. But not all omens come true, and you will understand from our theories that they need not all come true.

FOURTH LECTURE. THE PSYCHOLOGY OF ERRORS — (Conclusion)

WE may certainly put it down as the conclusion of our labors up to this point that errors have a meaning, and we may make this conclusion the basis of our further investigations. Let me stress the fact once more that we do not assert — and for our purposes need not assert — that every single mistake which occurs is meaningful, although I consider that probable. It will suffice us if we prove the presence of such a meaning with relative frequency in the various forms of errors. These various forms, by the way, behave differently in this respect. In the cases of tongue slips, pen slips, etc., the occurrences may take place on a purely physiological basis. In the group based on forgetfulness (forgetting names or projects, mislaying objects, etc.) I cannot believe in such a basis. There does very probably exist a type of case in which the loss of objects should be recognized as unintentional. Of the mistakes which occur in daily life, only a certain portion can in any way be brought within our conception. You must keep this limitation in mind when we start henceforth from the assumption that mistakes are psychic acts and arise through the mutual interference of two intentions.

Herein we have the first result of psychoanalysis. Psychology hitherto knew nothing of the occurrence of such interferences and the possibility that they might have such manifestations as a consequence. We have widened the province of the world of psychic phenomena quite considerably, and have brought into the province of psychology phenomena which formerly were not attributed to it.

Let us tarry a moment longer over the assertion that errors are psychic acts. Does such an assertion contain more than the former declaration that they have a meaning? I do not believe so. On the contrary, it is rather more indefinite and open to greater misunderstanding. Everything which can be observed about the psychic life will on occasion be designated as a psychic phenomenon. But it will depend on whether the specific psychic manifestations resulted directly from bodily, organic, material influences, in which case their investigation will not fall within the province of psychology, or whether it was more immediately the result of other psychic occurrences back of which, somewhere, the series of organic

influences then begins. We have the latter condition of affairs before us when we designate a phenomenon as a psychic manifestation, and for that reason it is more expedient to put our assertion in this form: the phenomena are meaningful; they have a meaning. By “meaning” we understand significance, purpose, tendency and position in a sequence of psychic relations.

There are a number of other occurrences which are very closely related to errors, but which this particular name no longer fits. We call them *accidental and symptomatic* acts. They also have the appearance of being unmotivated, the appearance of insignificance and unimportance, but in addition, and more plainly, of superfluity. They are differentiated from errors by the absence of another intention with which they collide and by which they are disturbed. On the other side they pass over without a definite boundary line into the gestures and movements which we count among expressions of the emotions. Among these accidental acts belong all those apparently playful, apparently purposeless performances in connection with our clothing, parts of our body, objects within reach, as well as the omission of such performances, and the melodies which we hum to ourselves. I venture the assertion that all these phenomena are meaningful and capable of interpretation in the same way as are the errors, that they are small manifestations of other more important psychic processes, valid psychic acts. But I do not intend to linger over this new enlargement of the province of psychic phenomena, but rather to return to the topic of errors, in the consideration of which the important psychoanalytic inquiries can be worked out with far greater clarity.

The most interesting questions which we formulated while considering errors, and which we have not yet answered, are, I presume, the following: We said that the errors are the result of the mutual interference of two different intentions, of which the one can be called the intention interfered with, and the other the interfering intention. The intentions interfered with give rise to no further questions, but concerning the others we want to know, firstly, what kind of intentions are these which arise as disturbers of others, and secondly, in what proportions are the interfering related to the interfered?

Will you permit me again to take the slip of the tongue as representative of the whole species and allow me to answer the second question before the first?

The interfering intention in the tongue slip may stand in a significant relation to the intention interfered with, and then the former contains a contradiction of the latter, correcting or supplementing it. Or, to take a less intelligible and more interesting case, the interfering intention has nothing to do with the intention interfered with.

Proofs for the first of the two relations we can find without trouble in the examples which we already know and in others similar to those. In almost all cases of tongue slips where one says the contrary of what he intended, where the interfering intention expresses the antithesis of the intention interfered with, the error is the presentation of the conflict between two irreconcilable strivings. “I declare the meeting opened, but would rather have it closed,” is the meaning of the president’s slip. A political paper which has been accused of corruptibility, defends itself in an article meant to reach a climax in the words: “Our readers will testify that we have always interceded for the good of all in the most *disinterested* manner.” But the editor who had been entrusted with the composition of the defence, wrote, “in the most *interested* manner.” That is, he thinks “To be sure, I have to write this way, but I know better.” A representative of the people who urges that the Kaiser should be told the truth “*rückhaltlos*,” hears an inner voice which is frightened by his boldness, and which through a slip changes the “*rückhaltlos*” into “*rückgratlos*.”

In the examples familiar to you, which give the impression of contraction and abbreviation, it is a question of a correction, an addition or continuation by which the second tendency manifests itself together with the first. “Things were revealed, but better say it right out, they were *filthy*, therefore, things were *refiled*.” “The people who understand this topic can be counted on the *fingers of one hand*, but no, there is really only *one* who understands it; therefore, counted *on one finger*.” Or, “My husband may eat and drink whatever *he* wants. But you know very well that *I* don’t permit him to want anything; therefore he may eat and drink whatever *I want*.” In all these cases, therefore, the slip arises from the content of the intention itself, or is connected with it.

The other type of relationship between the two interfering intentions seems strange. If the interfering intention has nothing to do with the content of the one interfered with, where then does it come from and how does it happen to make itself manifest as interference just at that point? The observation which alone can furnish an answer here, recognizes the

fact that the interference originates in a thought process which has just previously occupied the person in question and which then has that after-effect, irrespective of whether it has already found expression in speech or not. It is therefore really to be designated as perseveration, but not necessarily as the perseveration of spoken words. Here also there is no lack of an associative connection between the interfering and the interfered with, yet it is not given in the content, but artificially restored, often by means of forced connecting links.

Here is a simple example of this, which I myself observed. In our beautiful Dolomites, I meet two Viennese ladies who are gotten up as tourists. I accompany them a short distance and we discuss the pleasures, but also the difficulties of the tourist's mode of life. One lady admits this way of spending the day entails much discomfort. "It is true," she says, "that it is not at all pleasant, when one has tramped all day in the sun, and waist and shirt are soaked through." At this point in this sentence she suddenly has to overcome a slight hesitancy. Then she continues: "But then, when one gets *nach Hose*, and can change...." We did not analyze this slip, but I am sure you can easily understand it. The lady wanted to make the enumeration more complete and to say, "Waist, shirt and drawers." From motives of propriety, the mention of the drawers (Hose) was suppressed, but in the next sentence of quite independent content the unuttered word came to light as a distortion of the similar word, house (Hause).

Now we can turn at last to the long delayed main question, namely, what kind of intentions are these which get themselves expressed in an unusual way as interferences of others, intentions within whose great variety we wish nevertheless to find what is common to them all! If we examine a series of them to this end, we will soon find that they divide themselves into three groups. In the first group belong the cases in which the interfering tendency is known to the speaker, and which, moreover, was felt by him before the slip. Thus, in the case of the slip "*refilled*," the speaker not only admits that he agreed with the judgment "*filthy*," on the incidents in question, but also that he had the intention (which he later abandoned) of giving it verbal expression. A second group is made up of those cases in which the interfering tendency is immediately recognized by the subject as his own, but in which he is ignorant of the fact that the interfering tendency was active in him just before the slip. He therefore

accepts our interpretation, yet remains to a certain extent surprised by it. Examples of this situation can perhaps more easily be found among errors other than slips of the tongue. In a third group the interpretation of the interfering intention is energetically denied by the speaker. He not only denies that the interfering tendency was active in him before the slip, but he wants to assert that it was at all times completely alien to him. Will you recall the example of "hiccough," and the absolutely impolite disavowal which I received at the hands of this speaker by my disclosure of the interfering intention. You know that so far we have no unity in our conception of these cases. I pay no attention to the toastmaster's disavowal and hold fast to my interpretation; while you, I am sure, are yet under the influence of his repudiation and are considering whether one ought not to forego the interpretation of such slips, and let them pass as purely physiological acts, incapable of further analysis. I can imagine what it is that frightens you off. My interpretation draws the conclusion that intentions of which he himself knows nothing may manifest themselves in a speaker, and that I can deduce them from the circumstances. You hesitate before so novel a conclusion and one so full of consequences. I understand that, and sympathize with you to that extent. But let us make one thing clear: if you want consistently to carry through the conception of errors which you have derived from so many examples, you must decide to accept the above conclusion, even though it be unpleasant. If you cannot do so, you must give up that understanding of errors which you have so recently won.

Let us tarry a while over the point which unites the three groups, which is common to the three mechanisms of tongue slips. Fortunately, that is unmistakable. In the first two groups the interfering tendency is recognized by the speaker; in the first there is the additional fact that it showed itself immediately before the slip. In both cases, however, *it was suppressed. The speaker had made up his mind not to convert the interfering tendency into speech and then the slip of the tongue occurred; that is to say, the suppressed tendency obtains expression against the speaker's will, in that it changes the expression of the intention which he permits, mixes itself with it or actually puts itself in its place.* This is, then, the mechanism of the tongue slip.

From my point of view, I can also best harmonize the processes of the third group with the mechanism here described. I need only assume that

these three groups are differentiated by the different degrees of effectiveness attending the suppression of an intention. In the first group, the intention is present and makes itself perceptible before the utterance of the speaker; not until then does it suffer the suppression for which it indemnifies itself in the slip. In the second group the suppression extends farther. The intention is no longer perceptible before the subject speaks. It is remarkable that the interfering intention is in no way deterred by this from taking part in the causation of the slip. Through this fact, however, the explanation of the procedure in the third group is simplified for us. I shall be so bold as to assume that in the error a tendency can manifest itself which has been suppressed for even a longer time, perhaps a very long time, which does not become perceptible and which, therefore, cannot be directly denied by the speaker. But leave the problem of the third group; from the observation of the other cases, you most draw the conclusion that *the suppression of the existing intention to say something is the indispensable condition of the occurrence of a slip*.

We may now claim that we have made further progress in understanding errors. We know not only that they are psychic acts, in which we can recognize meaning and purpose, and that they arise through the mutual interference of two different intentions, but, in addition, we know that one of these intentions must have undergone a certain suppression in order to be able to manifest itself through interference with the other. The interfering intention must itself first be interfered with before it can become interfering. Naturally, a complete explanation of the phenomena which we call errors is not attained to by this. We immediately see further questions arising, and suspect in general that there will be more occasions for new questions as we progress further. We might, for example, ask why the matter does not proceed much more simply. If there is an existing purpose to suppress a certain tendency instead of giving it expression, then this suppression should be so successful that nothing at all of the latter comes to light; or it could even fail, so that the suppressed tendency attains to full expression. But errors are compromise formations. They mean some success and some failure for each of the two purposes. The endangered intention is neither completely suppressed nor does it, without regard to individual cases, come through wholly intact. We can imagine that special conditions must be existent for the occurrence of such interference or compromise formations, but then we cannot even

conjecture what sort they may be. Nor do I believe that we can uncover these unknown circumstances through further penetration into the study of errors. Rather will it be necessary thoroughly to examine other obscure fields of psychic life. Only the analogies which we there encounter can give us the courage to draw those assumptions which are requisite to a more fundamental elucidation of errors. And one thing more. Even working with small signs, as we have constantly been in the habit of doing in this province, brings its dangers with it. There is a mental disease, combined paranoia, in which the utilization of such small signs is practiced without restriction and I naturally would not wish to give it as my opinion that these conclusions, built up on this basis, are correct throughout. We can be protected from such dangers only by the broad basis of our observations, by the repetition of similar impressions from the most varied fields of psychic life.

We will therefore leave the analysis of errors here. But may I remind you of one thing more: keep in mind, as a prototype, the manner in which we have treated these phenomena. You can see from these examples what the purposes of our psychology are. We do not wish merely to describe the phenomena and to classify them, but to comprehend them as signs of a play of forces in the psychic, as expressions of tendencies striving to an end, tendencies which work together or against one another. We seek a dynamic conception of psychic phenomena. The perceived phenomena must, in our conception, give way to those strivings whose existence is only assumed.

Hence we will not go deeper into the problem of errors, but we can still undertake an expedition through the length of this field, in which we will reëncounter things familiar to us, and will come upon the tracks of some that are new. In so doing we will keep to the division which we made in the beginning of our study, of the three groups of tongue slips, with the related forms of pen slips, misreadings, mishearings, forgetfulness with its subdivisions according to the forgotten object (proper names, foreign words, projects, impressions), and the other faults of mistaking, mislaying and losing objects. Errors, in so far as they come into our consideration, are grouped in part with forgetfulness, in part with mistakes.

We have already spoken in such detail of tongue slips, and yet there are still several points to be added. Linked with tongue slips are smaller effective phenomena which are not entirely without interest. No one likes

to make a slip of the tongue; often one fails to hear his own slip, though never that of another. Tongue slips are in a certain sense infectious; it is not at all easy to discuss tongue slips without falling into slips of the tongue oneself. The most trifling forms of tongue slips are just the ones which have no particular illumination to throw on the hidden psychic processes, but are nevertheless not difficult to penetrate in their motivation. If, for example, anyone pronounces a long vowel as a short, in consequence of an interference no matter how motivated, he will for that reason soon after lengthen a short vowel and commit a new slip in compensation for the earlier one. The same thing occurs when one has pronounced a double vowel unclearly and hastily; for example, an “eu” or an “oi” as “ei.” The speaker tries to correct it by changing a subsequent “ei” or “eu” to “oi.” In this conduct the determining factor seems to be a certain consideration for the hearer, who is not to think that it is immaterial to the speaker how he treats his mother tongue. The second, compensating distortion actually has the purpose of making the hearer conscious of the first, and of assuring him that it also did not escape the speaker. The most frequent and most trifling cases of slips consist in the contractions and foresoundings which show themselves in inconspicuous parts of speech. One’s tongue slips in a longer speech to such an extent that the last word of the intended speech is said too soon. That gives the impression of a certain impatience to be finished with the sentence and gives proof in general of a certain resistance to communicating this sentence or speech as a whole. Thus we come to borderline cases in which the differences between the psychoanalytic and the common physiological conception of tongue slips are blended. We assume that in these cases there is a tendency which interferes with the intention of the speech. But it can only announce that it is present, and not what its own intention is. The interference which it occasions then follows some sound influences or associative relationship, and may be considered as a distraction of attention from the intended speech. But neither this disturbance of attention nor the associative tendency which has been activated, strikes the essence of the process. This hints, however, at the existence of an intention which interferes with the purposed speech, an intention whose nature cannot (as is possible in all the more pronounced cases of tongue slips) this time be guessed from its effects.

Slips of the pen, to which I now turn, are in agreement with those of the tongue to the extent that we need expect to gain no new points of view from them. Perhaps we will be content with a small gleaning. Those very common little slips of the pen — contractions, anticipations of later words, particularly of the last words — again point to a general distaste for writing, and to an impatience to be done; the pronounced effects of pen slips permit the nature and purpose of the interfering tendency to be recognized. One knows in general that if one finds a slip of the pen in a letter everything was not as usual with the writer. What was the matter one cannot always establish. The pen slip is frequently as little noticed by the person who makes it as the tongue slip. The following observation is striking: There are some persons who have the habit of always rereading a letter they have written before sending it. Others do not do so. But if the latter make an exception and reread the letter, they always have the opportunity of finding and correcting a conspicuous pen slip. How can that be explained? This looks as if these persons knew that they had made a slip of the pen while writing the letter. Shall we really believe that such is the case?

There is an interesting problem linked with the practical significance of the pen slip. You may recall the case of the murderer H., who made a practice of obtaining cultures of the most dangerous disease germs from scientific institutions, by pretending to be a bacteriologist, and who used these cultures to get his close relatives out of the way in this most modern fashion. This man once complained to the authorities of such an institution about the ineffectiveness of the culture which had been sent to him, but committed a pen slip and instead of the words, “in my attempts on mice and guinea pigs,” was plainly written, “in my attempts on people.” This slip even attracted the attention of the doctors at the institution, but so far as I know, they drew no conclusion from it. Now what do you think? Might not the doctors better have accepted the slip as a confession and instituted an investigation through which the murderer’s handiwork would have been blocked in time? In this case was not ignorance of our conception of errors to blame for an omission of practical importance? Well, I am inclined to think that such a slip would surely seem very suspicious to me, but a fact of great importance stands in the way of its utilization as a confession. The thing is not so simple. The pen slip is surely an indication, but by itself it would not have been sufficient to instigate an investigation. That the man

is preoccupied with the thought of infecting human beings, the slip certainly does betray, but it does not make it possible to decide whether this thought has the value of a clear plan of injury or merely of a phantasy having no practical consequence. It is even possible that the person who made such a slip will deny this phantasy with the best subjective justification and will reject it as something entirely alien to him. Later, when we give our attention to the difference between psychic and material reality, you will understand these possibilities even better. Yet this is again a case in which an error later attained unsuspected significance.

In misreading, we encounter a psychic situation which is clearly differentiated from that of the tongue slips or pen slips. The one of the two rival tendencies is here replaced by a sensory stimulus and perhaps for that reason is less resistant. What one is reading is not a production of one's own psychic activity, as is something which one intends to write. In a large majority of cases, therefore, the misreading consists in a complete substitution. One substitutes another word for the word to be read, and there need be no connection in meaning between the text and the product of the misreading. In general, the slip is based upon a word resemblance. Lichtenberg's example of reading "*Agamemnon*" for "*angenommen*" is the best of this group. If one wishes to discover the interfering tendency which causes the misreading, one may completely ignore the misread text and can begin the analytic investigation with the two questions: What is the first idea that occurs in free association to the product of the misreading, and, in what situation did the misreading occur? Now and then a knowledge of the latter suffices by itself to explain the misreading. Take, for example, the individual who, distressed by certain needs, wanders about in a strange city and reads the word "*Closethaus*" on a large sign on the first floor of a house. He has just time to be surprised at the fact that the sign has been nailed so high up when he discovers that, accurately observed, the sign reads "*Corset-haus*." In other cases the misreadings which are independent of the text require a penetrating analysis which cannot be accomplished without practice and confidence in the psychoanalytic technique. But generally it is not a matter of much difficulty to obtain the elucidation of a misreading. The substituted word, as in the example, "*Agamemnon*," betrays without more ado the thought sequence from which the interference results. In war times, for instance, it is very common for one to read into everything which contains a similar

word structure, the names of the cities, generals and military expressions which are constantly buzzing around us. In this way, whatever interests and preoccupies one puts itself in the place of that which is foreign or uninteresting. The after-effects of thoughts blur the new perceptions.

There are other types of misreadings, in which the text itself arouses the disturbing tendency, by means of which it is then most often changed into its opposite. One reads something which is undesired; analysis then convinces one that an intensive wish to reject what has been read should be made responsible for the alteration.

In the first mentioned and more frequent cases of misreading, two factors are neglected to which we gave an important role in the mechanism of errors: the conflict of two tendencies and the suppression of one which then indemnifies itself by producing the error. Not that anything like the opposite occurs in misreading, but the importunity of the idea content which leads to misreading is nevertheless much more conspicuous than the suppression to which the latter may previously have been subjected. Just these two factors are most tangibly apparent in the various situations of errors of forgetfulness.

Forgetting plans is actually uniform in meaning; its interpretation is, as we have heard, not denied even by the layman. The tendency interfering with the plan is always an antithetical intention, an unwillingness concerning which we need only discover why it does not come to expression in a different and less disguised manner. But the existence of this unwillingness is not to be doubted. Sometimes it is possible even to guess something of the motives which make it necessary for this unwillingness to disguise itself, and it always achieves its purpose by the error resulting from the concealment, while its rejection would be certain were it to present itself as open contradiction. If an important change in the psychic situation occurs between the formulation of the plan and its execution, in consequence of which the execution of the plan does not come into question, then the fact that the plan was forgotten is no longer in the class of errors. One is no longer surprised at it, and one understands that it would have been superfluous to have remembered the plan; it was then permanently or temporarily effaced. Forgetting a plan can be called an error only when we have no reason to believe there was such an interruption.

The cases of forgetting plans are in general so uniform and transparent that they do not interest us in our investigation. There are two points, however, from which we can learn something new. We have said that forgetting, that is, the non-execution of a plan, points to an antipathy toward it. This certainly holds, but, according to the results of our investigations, the antipathy may be of two sorts, direct and indirect. What is meant by the latter can best be explained by one or two examples. If a patron forgets to say a good word for his protegé to a third person, it may be because the patron is not really very much interested in the protegé, therefore, has no great inclination to commend him. It is, at any rate, in this sense that the protegé will construe his patron's forgetfulness. But the matter may be more complicated. The patron's antipathy to the execution of the plan may originate in another quarter and fasten upon quite a different point. It need not have anything to do with the protegé, but may be directed toward the third person to whom the good word was to have been said. Thus, you see what doubts here confront the practical application of our interpretation. The protegé, despite a correct interpretation of the forgetfulness, stands in danger of becoming too suspicious, and of doing his patron a grave injustice. Or, if an individual forgets a rendezvous which he has made, and which he had resolved to keep, the most frequent basis will certainly be the direct aversion to encountering this person. But analysis might here supply the information that the interfering intention was not directed against that person, but against the place in which they were to have met, and which was avoided because of a painful memory associated with it. Or, if one forgets to mail a letter, the counter-intention may be directed against the content of that letter, yet this does not in any way exclude the possibility that the letter is harmless in itself, and only subject to the counter-intention because something about it reminds the writer of another letter written previously, which, in fact, did afford a basis for the antipathy. One can say in such a case that the antipathy has here transferred itself from that former letter where it was justified to the present one in which it really has no meaning. Thus you see that one must always exercise restraint and caution in the application of interpretations, even though the interpretations are justified. That which is psychologically equivalent may nevertheless in practice be very ambiguous.

Phenomena such as these will seem very unusual to you. Perhaps you are inclined to assume that the “indirect” antipathy is enough to characterize the incident as pathological. Yet I can assure you that it also occurs in a normal and healthy setting. I am in no way willing to admit the unreliability of our analytic interpretation. After all, the above-discussed ambiguity of plan-forgetting exists only so long as we have not attempted an analysis of the case, and are interpreting it only on the basis of our general suppositions. When we analyze the person in question, we discover with sufficient certainty in each case whether or not it is a direct antipathy, or what its origin is otherwise.

A second point is the following: when we find in a large majority of cases that the forgetting of a plan goes back to an antipathy, we gain courage to extend this solution to another series of cases in which the analyzed person does not confirm, but denies, the antipathy which we inferred. Take as an example the exceedingly frequent incidents of forgetting to return books which one has borrowed, or forgetting to pay one’s bills or debts. We will be so bold as to accuse the individual in question of intending to keep the books and not to pay the debts, while he will deny such an intention but will not be in a position to give us any other explanation of his conduct. Thereupon we insist that he has the intention, only he knows nothing about it; all we need for our inference is to have the intention betray itself through the effect of the forgetfulness. The subject may then repeat that he had merely forgotten it. You now recognize the situation as one in which we once before found ourselves. If we wish to be consistent in our interpretation, an interpretation which has been proved as manifold as it is justified, we will be unavoidably forced to the conclusion that there are tendencies in a human being which can become effective without his being conscious of them. By so doing, however, we place ourselves in opposition to all the views which prevail in daily life and in psychology.

Forgetting proper names and foreign names as well as foreign words can be traced in the same manner to a counter-intention which aims either directly or indirectly at the name in question. I have already given you an example of such direct antipathy. The indirect causation, however, is particularly frequent and generally necessitates careful analysis for its determination. Thus, for example, in war times which force us to sacrifice so many of our former inclinations, the ability to recall proper names also

suffers severely in consequence of the most peculiar connections. A short time ago it happened that I could not reproduce the name of that harmless Moravian city of Bisenz, and analysis showed that no direct dislike was to blame, but rather the sound resemblance to the name of the Bisenzi palace in Orrieto, in which I used to wish I might live. As a motive for the antagonism to remembering the name, we here encounter for the first time a principle which will later disclose to us its whole tremendous significance in the causation of neurotic symptoms, viz., the aversion on the part of the memory to remembering anything which is connected with unpleasant experience and which would revive this unpleasantness by a reproduction. This intention of avoiding unpleasantness in recollections of other psychic acts, the psychic flight from unpleasantness, we may recognize as the ultimate effective motive not only for the forgetting of names, but also for many other errors, such as omissions of action, etc.

Forgetting names does, however, seem to be especially facilitated psycho-physiologically and therefore also occurs in cases in which the interference of an unpleasantness-motive cannot be established. If anyone once has a tendency to forget names, you can establish by analytical investigation that he not only loses names because he himself does not like them, or because they remind him of something he does not like, but also because the same name in his mind belongs to another chain of associations, with which he has more intimate relations. The name is anchored there, as it were, and denied to the other associations activated at the moment. If you will recall the tricks of mnemonic technique you will ascertain with some surprise that one forgets names in consequence of the same associations which one otherwise purposely forms in order to save them from being forgotten. The most conspicuous example of this is afforded by proper names of persons, which conceivably enough must have very different psychic values for different people. For example, take a first name, such as Theodore. To one of you it will mean nothing special, to another it means the name of his father, brother, friend, or his own name. Analytic experience will then show you that the first person is not in danger of forgetting that a certain stranger bears this name, while the latter will be constantly inclined to withhold from the stranger this name which seems reserved for intimate relationships. Let us now assume that this associative inhibition can come into contact with the operation of the unpleasantness-principle, and in addition with an indirect mechanism, and

you will be in a position to form a correct picture of the complexity of causation of this temporary name-forgetting. An adequate analysis that does justice to the facts, however, will completely disclose these complications.

Forgetting impressions and experiences shows the working of the tendency to keep unpleasantness from recollection much more clearly and conclusively than does the forgetting of names. It does not, of course, belong in its entirety to the category of errors, but only in so far as it seems to us conspicuous and unjustified, measured by the measuring stick of our accustomed conception — thus, for example, where the forgetfulness strikes fresh or important impressions or impressions whose loss tears a hole in the otherwise well-remembered sequence. Why and how it is in general that we forget, particularly why and how we forget experiences which have surely left the deepest impressions, such as the incidents of our first years of childhood, is quite a different problem, in which the defense against unpleasant associations plays a certain role but is far from explaining everything. That unpleasant impressions are easily forgotten is an indubitable fact. Various psychologists have observed it, and the great Darwin was so struck by it that he made the “golden rule” for himself of writing down with particular care observations which seemed unfavorable to his theory, since he had convinced himself that they were just the ones which would not stick in his memory.

Those who hear for the first time of this principle of defense against unpleasant recollections by means of forgetting, seldom fail to raise the objection that they, on the contrary, have had the experience that just the painful is hard to forget, inasmuch as it always comes back to mind to torture the person against his will — as, for example, the recollection of an insult or humiliation. This fact is also correct, but the objection is not valid. It is important that one begin betimes to reckon with the fact that the psychic life is the arena of the struggles and exercises of antagonistic tendencies, or, to express it in non-dynamic terminology, that it consists of contradictions and paired antagonisms. Information concerning one specific tendency is of no avail for the exclusion of its opposite; there is room for both of them. It depends only on how the opposites react upon each other, what effects will proceed from the one and what from the other.

Losing and mislaying objects is of especial interest to us because of the ambiguity and the multiplicity of tendencies in whose services the errors may act. The common element in all cases is this, that one wished to lose something. The reasons and purposes thereof vary. One loses an object when it has become damaged, when one intends to replace it with a better one, when one has ceased to like it, when it came from a person whose relations to one have become strained, or when it was obtained under circumstances of which one no longer wishes to think. The same purpose may be served by letting the object fall, be damaged or broken. In the life of society it is said to have been found that unwelcome and illegitimate children are much more often frail than those born in wedlock. To reach this result we do not need the coarse technique of the so-called angel-maker. A certain remissness in the care of the child is said to suffice amply. In the preservation of objects, the case might easily be the same as with the children.

But things may be singled out for loss without their having forfeited any of their value, namely, when there exists the intention to sacrifice something to fate in order to ward off some other dreaded loss. Such exorcisings of fate are, according to the findings of analysis, still very frequent among us; therefore, the loss of things is often a voluntary sacrifice. In the same way losing may serve the purposes of obstinacy or self-punishment. In short, the more distant motivation of the tendency to get rid of a thing oneself by means of losing it is not overlooked.

Mistakes, like other errors, are often used to fulfill wishes which one ought to deny oneself. The purpose is thus masked as fortunate accident; for instance, one of our friends once took the train to make a call in the suburbs, despite the clearest antipathy to so doing, and then, in changing cars, made the mistake of getting into the train which took him back to the city. Or, if on a trip one absolutely wants to make a longer stay at a half-way station, one is apt to overlook or miss certain connections, so that he is forced to make the desired interruption to the trip. Or, as once happened to a patient of mine whom I had forbidden to call up his fiancée on the telephone, “by mistake” and “absent-mindedly” he asked for a wrong number when he wanted to telephone to me, so that he was suddenly connected with the lady. A pretty example and one of practical significance in making a direct mistake is the observation of an engineer at a preliminary hearing in a damage suit:

“Some time ago I worked with several colleagues in the laboratory of a high school on a series of complicated elasticity experiments, a piece of work which we had undertaken voluntarily but which began to take more time than we had expected. One day as I went into the laboratory with my colleague F., the latter remarked how unpleasant it was to him to lose so much time that day, since he had so much to do at home. I could not help agreeing with him, and remarked half jokingly, alluding to an incident of the previous week: ‘Let’s hope that the machine gives out again so that we can stop work and go home early.’

“In the division of labor it happened that F. was given the regulation of the valve of the press, that is to say, he was, by means of a cautious opening of the valve, to let the liquid pressure from the accumulator flow slowly into the cylinder of the hydraulic press. The man who was directing the job stood by the manometer (pressure gauge) and when the right pressure had been reached called out in a loud voice: ‘Stop.’ At this command F. seized the valve and turned with all his might — to the left! (All valves, without exception, close to the right.) Thereby the whole pressure of the accumulator suddenly became effective in the press, a strain for which the connecting pipes are not designed, so that a connecting pipe immediately burst — quite a harmless defect, but one which nevertheless forced us to drop work for the day and go home.

“It is characteristic, by the way, that some time afterward when we were discussing this occurrence, my friend F. had no recollection whatever of my remark, which I could recall with certainty.”

From this point you may reach the conjecture that it is not harmless accident which makes the hands of your domestics such dangerous enemies to your household property. But you can also raise the question whether it is always an accident when one damages himself and exposes his own person to danger. There are interests the value of which you will presently be able to test by means of the analysis of observations.

Ladies and gentlemen, this is far from being all that might be said about errors. There is indeed much left to investigate and to discuss. But I am satisfied if, from our investigations to date, your previous views are somewhat shaken and if you have acquired a certain degree of liberality in the acceptance of new ones. For the rest, I must content myself with leaving you face to face with an unclear condition of affairs. We cannot prove all our axioms by the study of errors and, indeed, are by no means

solely dependent on this material. The great value of errors for our purpose lies in the fact that they are very frequent phenomena that can easily be observed on oneself and the occurrence of which do not require a pathological condition. I should like to mention just one more of your unanswered questions before concluding: “If, as we have seen in many examples, people come so close to understanding errors and so often act as though they penetrated their meaning, how is it possible that they can so generally consider them accidental, senseless and meaningless, and can so energetically oppose their psychoanalytic elucidation?”

You are right; that is conspicuous and demands an explanation. I shall not give this explanation to you, however, but shall guide you slowly to the connecting links from which the explanation will force itself upon you without any aid from me.

PART II. THE DREAM

FIFTH LECTURE. THE DREAM

Difficulties and Preliminary Approach

ONE day the discovery was made that the disease symptoms of certain nervous patients have a meaning. Thereupon the psychoanalytic method of therapy was founded. In this treatment it happened that the patients also presented dreams in place of their symptoms. Herewith originated the conjecture that these dreams also have a meaning.

We will not, however, pursue this historical path, but enter upon the opposite one. We wish to discover the meaning of dreams as preparation for the study of the neuroses. This inversion is justified, for the study of dreams is not only the best preparation for that of the neuroses, but the dream itself is also a neurotic symptom, and in fact one which possesses for us the incalculable advantage of occurring in all normals. Indeed, if all human beings were well and would dream, we could gain from their dreams almost all the insight to which the study of the neuroses has led.

Thus it is that the dream becomes the object of psychoanalytic research — again an ordinary, little-considered phenomenon, apparently of no practical value, like the errors with which, indeed, it shares the character of occurring in normals. But otherwise the conditions are rather less favorable for our work. Errors had been neglected only by science, which had paid little attention to them; but at least it was no disgrace to occupy one's self with them. People said there are indeed more important things, but perhaps something may come of it. Preoccupation with the dream, however, is not merely impractical and superfluous, but actually ignominious; it carries the odium of the unscientific, awakens the suspicion of a personal leaning towards mysticism. The idea of a physician busying himself with dreams when even in neuropathology and psychiatry there are matters so much more serious — tumors the size of apples which incapacitate the organ of the psyche, hemorrhages, and chronic inflammations in which one can demonstrate changes in the tissues under the microscope! No, the dream is much too trifling an object, and unworthy of Science.

And besides, it is a condition which in itself defies all the requirements of exact research — in dream investigation one is not even sure of one's object. A delusion, for example, presents itself in clear and definite outlines. "I am the Emperor of China," says the patient aloud. But the

dream? It generally cannot be related at all. If anyone relates a dream, has he any guarantee that he has told it correctly, and not changed it during the telling, or invented an addition which was forced by the indefiniteness of his recollection? Most dreams cannot be remembered at all, are forgotten except for small fragments. And upon the interpretation of such material shall a scientific psychology or method of treatment for patients be based?

A certain excess in judgment may make us suspicious. The objections to the dream as an object of research obviously go too far. The question of insignificance we have already had to deal with in discussing errors. We said to ourselves that important matters may manifest themselves through small signs. As concerns the indefiniteness of the dream, it is after all a characteristic like any other. One cannot prescribe the characteristics of an object. Moreover, there are clear and definite dreams. And there are other objects of psychiatric research which suffer from the same trait of indefiniteness, e.g., many compulsion ideas, with which even respectable and esteemed psychiatrists have occupied themselves. I might recall the last case which occurred in my practice. The patient introduced himself to me with the words, “I have a certain feeling as though I had harmed or had wished to harm some living thing — a child? — no, more probably a dog — perhaps pushed it off a bridge — or something else.” We can overcome to some degree the difficulty of uncertain recollection in the dream if we determine that exactly what the dreamer tells us is to be taken as his dream, without regard to anything which he has forgotten or may have changed in recollection. And finally, one cannot make so general an assertion as that the dream is an unimportant thing. We know from our own experience that the mood in which one wakes up after a dream may continue throughout the whole day. Cases have been observed by physicians in which a psychosis begins with a dream and holds to a delusion which originated in it. It is related of historical personages that they drew their inspiration for important deeds from dreams. So we may ask whence comes the contempt of scientific circles for the dream?

I think it is the reaction to their over-estimation in former times. Reconstruction of the past is notoriously difficult, but this much we may assume with certainty — if you will permit me the jest — that our ancestors of 3000 years ago and more, dreamed much in the way we do. As far as we know, all ancient peoples attached great importance to dreams and considered them of practical value. They drew omens for the future

from dreams, sought premonitions in them. In those days, to the Greeks and all Orientals, a campaign without dream interpreters must have been as impossible as a campaign without an aviation scout to-day. When Alexander the Great undertook his campaign of conquests, the most famous dream interpreters were in attendance. The city of Tyrus, which was then still situated on an island, put up so fierce a resistance that Alexander considered the idea of raising the siege. Then he dreamed one night of a satyr dancing as if in triumph; and when he laid his dream before his interpreters he received the information that the victory over the city had been announced to him. He ordered the attack and took Tyrus. Among the Etruscans and the Romans other methods of discovering the future were in use, but the interpretation of dreams was practical and esteemed during the entire Hellenic-Roman period. Of the literature dealing with the topic at least the chief work has been preserved to us, namely, the book of Artemidoros of Daldis, who is supposed to have lived during the lifetime of the Emperor Hadrian. How it happened subsequently that the art of dream interpretation was lost and the dream fell into discredit, I cannot tell you. Enlightenment cannot have had much part in it, for the Dark Ages faithfully preserved things far more absurd than the ancient dream interpretation. The fact is, the interest in dreams gradually deteriorated into superstition, and could assert itself only among the ignorant. The latest misuse of dream interpretation in our day still tries to discover in dreams the numbers which are going to be drawn in the small lottery. On the other hand, the exact science of to-day has repeatedly dealt with dreams, but always only with the purpose of applying its physiological theories to the dream. By physicians, of course, the dream was considered as a non-psychic act, as the manifestation of somatic irritations in the psychic life. Binz (1876) pronounced the dream “a bodily process, in all cases useless, in many actually pathological, above which the world-soul and immortality are raised as high as the blue ether over the weed-grown sands of the lowest plain.” Maury compared it with the irregular twitchings of St. Vitus’ Dance in contrast to the co-ordinated movements of the normal person. An old comparison makes the content of the dream analogous to the tones which the “ten fingers of a musically illiterate person would bring forth if they ran over the keys of the instrument.”

Interpretation means finding a hidden meaning. There can be no question of interpretation in such an estimation of the dream process. Look up the description of the dream in Wundt, Jodl and other newer philosophers. You will find an enumeration of the deviations of dream life from waking thought, in a sense disparaging to the dream. The description points out the disintegration of association, the suspension of the critical faculty, the elimination of all knowledge, and other signs of diminished activity. The only valuable contribution to the knowledge of the dream which we owe to exact science pertains to the influence of bodily stimuli, operative during sleep, on the content of the dream. There are two thick volumes of experimental researches on dreams by the recently deceased Norwegian author, J. Mourly Vold, (translated into German in 1910 and 1912), which deal almost solely with the consequences of changes in the position of the limbs. They are recommended as the prototype of exact dream research. Now can you imagine what exact science would say if it discovered that we wish to attempt to find the meaning of dreams? It may be it has already said it, but we will not allow ourselves to be frightened off. If errors can have a meaning, the dream can, too, and errors in many cases have a meaning which has escaped exact science. Let us confess to sharing the prejudice of the ancients and the common people, and let us follow in the footsteps of the ancient dream interpreters.

First of all, we must orient ourselves in our task, and take a bird’s eye view of our field. What is a dream? It is difficult to say in one sentence. But we do not want to attempt any definition where a reference to the material with which everyone is familiar suffices. Yet we ought to select the essential element of the dream. How can that be found? There are such monstrous differences within the boundary which encloses our province, differences in every direction. The essential thing will very probably be that which we can show to be common to all dreams.

Well, the first thing which is common to all dreams is that we are asleep during their occurrence. The dream is apparently the psychic life during sleep, which has certain resemblances to that of the waking condition, and on the other hand is distinguished from it by important differences. That was noted even in Aristotle’s definition. Perhaps there are other connections obtaining between the dream and sleep. One can be awakened by a dream, one frequently has a dream when he wakes spontaneously or is forcibly awakened from sleep. The dream then seems

to be an intermediate condition between sleeping and waking. Thus we are referred to the problem of sleep. What, then, is sleep?

That is a physiological or biological problem concerning which there is still much controversy. We can form no decision on the point, but I think we may attempt a psychological characterization of sleep. Sleep is a condition in which I wish to have nothing to do with the external world, and have withdrawn my interest from it. I put myself to sleep by withdrawing myself from the external world and by holding off its stimuli. I also go to sleep when I am fatigued by the external world. Thus, by going to sleep, I say to the external world, "Leave me in peace, for I wish to sleep." Conversely, the child says, "I won't go to bed yet, I am not tired, I want to have some more fun." The biological intention of sleep thus seems to be recuperation; its psychological character, the suspension of interest in the external world. Our relation to the world into which we came so unwillingly, seems to include the fact that we cannot endure it without interruption. For this reason we revert from time to time to the pre-natal existence, that is, to the intra-uterine existence. At least we create for ourselves conditions quite similar to those obtaining at that time — warmth, darkness and the absence of stimuli. Some of us even roll ourselves into tight packages and assume in sleep a posture very similar to the intra-uterine posture. It seems as if the world did not wholly possess us adults, it has only two-thirds of our life, we are still one-third unborn. Each awakening in the morning is then like a new birth. We also speak of the condition after sleep with the words, "I feel as though I had been born anew," by which we probably form a very erroneous idea of the general feeling of the newly born. It may be assumed that the latter, on the contrary, feel very uncomfortable. We also speak of birth as "seeing the light of day." If that be sleep, then the dream is not on its program at all, rather it seems an unwelcome addition. We think, too, that dreamless sleep is the best and only normal sleep. There should be no psychic activity in sleep; if the psyche stirs, then just to that extent have we failed to reduplicate the foetal condition; remainders of psychic activity could not be completely avoided. These remainders are the dream. Then it really does seem that the dream need have no meaning. It was different in the case of errors; they were activities of the waking state. But when I am asleep, have quite suspended psychic activity and have suppressed all but certain of its remainders, then it is by no means inevitable that these

remainders have a meaning. In fact, I cannot make use of this meaning, in view of the fact that the rest of my psyche is asleep. This must, of course, be a question only of twitching, like spasmodic reactions, a question only of psychic phenomena such as follow directly upon somatic stimulation. The dream, therefore, appears to be the sleep-disturbing remnant of the psychic activity of waking life, and we may make the resolution promptly to abandon a theme which is so ill-adapted to psychoanalysis.

However, even if the dream is superfluous, it exists nevertheless and we may try to give an account of its existence. Why does not the psyche go to sleep? Probably because there is something which gives it no rest. Stimuli act upon the psyche, and it must react to them. The dream, therefore, is the way in which the psyche reacts to the stimuli acting upon it in the sleeping condition. We note here a point of approach to the understanding of the dream. We can now search through different dreams to discover what are the stimuli which seek to disturb the sleep and which are reacted to with dreams. Thus far we might be said to have discovered the first common element.

Are there other common elements? Yes, it is undeniable that there are, but they are much more difficult to grasp and describe. The psychic processes of sleep, for example, have a very different character from those of waking. One experiences many things in the dream, and believes in them, while one really has experienced nothing but perhaps the one disturbing stimulus. One experiences them predominantly in visual images; feelings may also be interspersed in the dream as well as thoughts; the other senses may also have experiences, but after all the dream experiences are predominantly pictures. A part of the difficulty of dream telling comes from the fact that we have to transpose these pictures into words. “I could draw it,” the dreamer says frequently, “but I don’t know how to say it.” That is not really a case of diminished psychic activity, like that of the feeble-minded in comparison with the highly gifted; it is something qualitatively different, but it is difficult to say wherein the difference lies. G. T. Fechner once hazarded the conjecture that the scene in which dreams are played is a different one from that of the waking perceptual life. To be sure, we do not understand this, do not know what we are to think of it, but the impression of strangeness which most dreams make upon us does really bear this out. The comparison of the dream activity with the effects of a hand untrained in music also fails

at this point. The piano, at least, will surely answer with the same tones, even if not with melodies, as soon as by accident one brushes its keys. Let us keep this second common element of all dreams carefully in mind, even though it be not understood.

Are there still further traits in common? I find none, and see only differences everywhere, differences indeed in the apparent length as well as the definiteness of the activities, participation of effects, durability, etc. All this really is not what we might expect of a compulsion-driven, irresistible, convulsive defense against a stimulus. As concerns the dimensions of dreams, there are very short ones which contain only one picture or a few, one thought — yes, even one word only — , others which are uncommonly rich in content, seem to dramatize whole novels and to last very long. There are dreams which are as plain as an experience itself, so plain that we do not recognize them as dreams for a long time after waking; others which are indescribably weak, shadowy and vague; indeed in one and the same dream, the overemphasized and the scarcely comprehensible, indefinite parts may alternate with each other. Dreams may be quite meaningful or at least coherent, yes, even witty, fantastically beautiful. Others, again, are confused, as if feeble-minded, absurd, often actually mad. There are dreams which leave us quite cold, others in which all the effects come to expression — pain deep enough for tears, fear strong enough to waken us, astonishment, delight, etc. Dreams are generally quickly forgotten upon waking, or they may hold over a day to such an extent as to be faintly and incompletely remembered in the evening. Others, for example, the dreams of childhood, are so well preserved that they stay in the memory thirty years later, like fresh experiences. Dreams, like individuals, may appear a single time, and never again, or they may repeat themselves unchanged in the same person, or with small variations. In short, this nightly psychic activity can avail itself of an enormous repertoire, can indeed compass everything which the psychic accomplishes by day, but yet the two are not the same.

One might try to give an account of this many-sidedness of the dream by assuming that it corresponds to different intermediate stages between sleeping and waking, different degrees of incomplete sleep. Yes, but in that case as the psyche nears the waking state, the conviction that it is a dream ought to increase along with the value, content and distinctiveness of the dream product, and it would not happen that immediately beside a distinct

and sensible dream fragment a senseless and indistinct one would occur, to be followed again by a goodly piece of work. Surely the psyche could not change its degree of somnolence so quickly. This explanation thus avails us nothing; at any rate, it cannot be accepted offhand.

Let us, for the present, give up the idea of finding the meaning of the dream and try instead to clear a path to a better understanding of the dream by means of the elements common to all dreams. From the relation of dreams to the sleeping condition, we concluded that the dream is the reaction to a sleep-disturbing stimulus. As we have heard, this is the only point upon which exact experimental psychology can come to our assistance; it gives us the information that stimuli applied during sleep appear in the dream. There have been many such investigations carried out, including that of the above mentioned Mourly Vold. Indeed, each of us must at some time have been in a position to confirm this conclusion by means of occasional personal observations. I shall choose certain older experiments for presentation. Maury had such experiments made on his own person. He was allowed to smell cologne while dreaming. He dreamed that he was in Cairo in the shop of Johann Marina Farina, and therewith were linked further extravagant adventures. Or, he was slightly pinched in the nape of the neck; he dreamed of having a mustard plaster applied, and of a doctor who had treated him in childhood. Or, a drop of water was poured on his forehead. He was then in Italy, perspired profusely, and drank the white wine of Orvieto.

What strikes us about these experimentally induced dreams we may perhaps be able to comprehend still more clearly in another series of stimulated dreams. Three dreams have been recounted by a witty observer, Hildebrand, all of them reactions to the sound of the alarm clock:

“I go walking one spring morning and saunter through the green fields to a neighboring village. There I see the inhabitants in gala attire, their hymn books under their arms, going church-ward in great numbers. To be sure, this is Sunday, and the early morning service will soon begin. I decide to attend, but since I am somewhat overheated, decide to cool off in the cemetery surrounding the church. While I am there reading several inscriptions, I hear the bell ringer ascend the tower, and now see the little village church bell which is to give the signal for the beginning of the service. The bell hangs a good bit longer, then it begins to swing, and suddenly its strokes sound clear and penetrating, so clear and penetrating

that they make an end of — my sleep. The bell-strokes, however, come from my alarm clock.

“A second combination. It is a clear winter day. The streets are piled high with snow. I agree to go on a sleighing party, but must wait a long time before the announcement comes that the sleigh is at the door. Then follow the preparations for getting in — the fur coat is put on, the footwarmer dragged forth — and finally I am seated in my place. But the departure is still delayed until the reins give the waiting horses the tangible signal. Now they pull; the vigorously shaken bells begin their familiar Janizary music so powerfully that instantly the spider web of the dream is torn. Again it is nothing but the shrill tone of the alarm clock.

“And still a third example. I see a kitchen maid walking along the corridor to the dining room with some dozens of plates piled high. The pillar of porcelain in her arms seems to me in danger of losing its balance. ‘Take care!’ I warn her. ‘The whole load will fall to the ground.’ Naturally, the inevitable retort follows: one is used to that, etc., and I still continue to follow the passing figure with apprehensive glances. Sure enough, at the threshold she stumbles — the brittle dishes fall and rattle and crash over the floor in a thousand pieces. But — the endless racket is not, as I soon notice, a real rattling, but really a ringing and with this ringing, as the awakened subject now realizes, the alarm has performed its duty.”

These dreams are very pretty, quite meaningful, not at all incoherent, as dreams usually are. We will not object to them on that score. That which is common to them all is that the situation terminates each time in a noise, which one recognizes upon waking up as the sound of the alarm. Thus we see here how a dream originates, but also discover something else. The dream does not recognize the alarm — indeed the alarm does not appear in the dream — the dream replaces the alarm sound with another, it interprets the stimulus which interrupts the sleep, but interprets it each time in a different way. Why? There is no answer to this question, it seems to be something arbitrary. But to understand the dream means to be able to say why it has chosen just this sound and no other for the interpretation of the alarm-clock stimulus. In quite analogous fashion, we must raise the objection to the Maury experiment that we see well enough that the stimulus appears in the dream, but that we do not discover why it appears in just this form; and that the form taken by the dream does not seem to follow from the nature of the sleep-disturbing stimulus. Moreover, in the

Maury experiments a mass of other dream material links itself to the direct stimulus product; as, for example, the extravagant adventures in the cologne dream, for which one can give no account.

Now I shall ask you to consider the fact that the waking dreams offer by far the best chances for determining the influence of external sleep-disturbing stimuli. In most of the other cases it will be more difficult. One does not wake up in all dreams, and in the morning, when one remembers the dream of the night, how can one discover the disturbing stimulus which was perhaps in operation at night? I did succeed once in subsequently establishing such a sound stimulus, though naturally only in consequence of special circumstances. I woke up one morning in a place in the Tyrolese Mountains, with the certainty that I had dreamt the Pope had died. I could not explain the dream, but then my wife asked me: “Did you hear the terrible bell ringing that broke out early this morning from all the churches and chapels?” No, I had heard nothing, my sleep is a sound one, but thanks to this information I understood my dream. How often may such stimuli incite the sleeper to dream without his knowing of them afterward? Perhaps often, perhaps infrequently; when the stimulus can no longer be traced, one cannot be convinced of its existence. Even without this fact we have given up evaluating the sleep disturbing stimuli, since we know that they can explain only a little bit of the dream, and not the whole dream reaction.

But we need not give up this whole theory for that reason. In fact, it can be extended. It is clearly immaterial through what cause the sleep was disturbed and the psyche incited to dream. If the sensory stimulus is not always externally induced, it may be instead a stimulus proceeding from the internal organs, a so-called somatic stimulus. This conjecture is obvious, and it corresponds to the most popular conception of the origin of dreams. Dreams come from the stomach, one often hears it said. Unfortunately it may be assumed here again that the cases are frequent in which the somatic stimulus which operated during the night can no longer be traced after waking, and has thus become unverifiable. But let us not overlook the fact that many recognized experiences testify to the derivation of dreams from the somatic stimulus. It is in general indubitable that the condition of the internal organs can influence the dream. The relation of many a dream content to a distention of the bladder or to an excited condition of the genital organs, is so clear that it cannot be

mistaken. From these transparent cases one can proceed to others in which, from the content of the dream, at least a justifiable conjecture may be made that such somatic stimuli have been operative, inasmuch as there is something in this content which may be conceived as elaboration, representation, interpretation of the stimuli. The dream investigator Schirmer (1861) insisted with particular emphasis on the derivation of the dream from organic stimuli, and cited several splendid examples in proof. For example, in a dream he sees “two rows of beautiful boys with blonde hair and delicate complexions stand opposite each other in preparation for a fight, fall upon each other, seize each other, take up the old position again, and repeat the whole performance;” here the interpretation of these rows of boys as teeth is plausible in itself, and it seems to become convincing when after this scene the dreamer “pulls a long tooth out of his jaws.” The interpretation of “long, narrow, winding corridors” as intestinal stimuli, seems sound and confirms Schirmer’s assertion that the dream above all seeks to represent the stimulus-producing organ by means of objects resembling it.

Thus we must be prepared to admit that the internal stimuli may play the same role in the dream as the external. Unfortunately, their evaluation is subject to the same difficulties as those we have already encountered. In a large number of cases the interpretation of the stimuli as somatic remains uncertain and undemonstrable. Not all dreams, but only a certain portion of them, arouse the suspicion that an internal organic stimulus was concerned in their causation. And finally, the internal stimuli will be as little able as the external sensory stimuli to explain any more of the dream than pertains to the direct reaction to the stimuli. The origin, therefore, of the rest of the dream remains obscure.

Let us, however, notice a peculiarity of dream life which becomes apparent in the study of these effects of stimuli. The dream does not simply reproduce the stimulus, but it elaborates it, it plays upon it, places it in a sequence of relationships, replaces it with something else. That is a side of dream activity which must interest us because it may lead us closer to the nature of the dream. If one does something under stimulation, then this stimulation need not exhaust the act. Shakespeare’s *Macbeth*, for example, is a drama created on the occasion of the coronation of the King who for the first time wore upon his head the crown symbolizing the union of three countries. But does this historical occasion cover the content of

the drama, does it explain its greatness and its riddle? Perhaps the external and internal stimuli, acting upon the sleeper, are only the incitors of the dream, of whose nature nothing is betrayed to us from our knowledge of that fact.

The other element common to dreams, their psychic peculiarity, is on the one hand hard to comprehend, and on the other hand offers no point for further investigation. In dreams we perceive a thing for the most part in visual forms. Can the stimuli furnish a solution for this fact? Is it actually the stimulus which we experience? Why, then, is the experience visual when optic stimulation incited the dream only in the rarest cases? Or can it be proved, when we dream speeches, that during sleep a conversation or sounds resembling it reached our ear? This possibility I venture decisively to reject.

If, from the common elements of dreams, we get no further, then let us see what we can do with their differences. Dreams are often senseless, blurred, absurd; but there are some that are meaningful, sober, sensible. Let us see if the latter, the sensible dreams, can give some information concerning the senseless ones. I will give you the most recent sensible dream which was told me, the dream of a young man: “I was promenading in Kärtner Street, met Mr. X. there, whom I accompanied for a bit, and then I went to a restaurant. Two ladies and a gentleman seated themselves at my table. I was annoyed at this at first, and would not look at them. Then I did look, and found that they were quite pretty.” The dreamer adds that the evening before the dream he had really been in Kärtner Street, which is his usual route, and that he had met Mr. X. there. The other portion of the dream is no direct reminiscence, but bears a certain resemblance to a previous experience. Or another meaningful dream, that of a lady. “Her husband asks, ‘Doesn’t the piano need tuning?’ She: ‘It is not worth while; it has to be newly lined.’” This dream reproduces without much alteration a conversation which took place the day before between herself and her husband. What can we learn from these two sober dreams? Nothing but that you find them to be reproductions of daily life or ideas connected therewith. This would at least be something if it could be stated of all dreams. There is no question, however, that this applies to only a minority of dreams. In most dreams there is no sign of any connection with the previous day, and no light is thereby cast on the senseless and absurd dream. We know only that we have struck a new problem. We wish

to know not only what it is that the dream says, but when, as in our examples, the dream speaks plainly, we also wish to know why and wherefore this recent experience is repeated in the dream.

I believe you are as tired as I am of continuing attempts like these. We see, after all, that the greatest interest in a problem is inadequate if one does not know a path which will lead to a solution. Up to this point we have not found this path. Experimental psychology gave us nothing but a few very valuable pieces of information concerning the meaning of stimuli as dream incitors. We need expect nothing from philosophy except that lately it has taken haughtily to pointing out to us the intellectual inferiority of our object. Let us not apply to the occult sciences for help. History and popular tradition tell us that the dream is meaningful and significant; it sees into the future. Yet that is hard to accept and surely not demonstrable. Thus our first efforts end in entire helplessness.

Unexpectedly we get a hint from a quarter toward which we have not yet looked. Colloquial usage — which after all is not an accidental thing but the remnant of ancient knowledge, though it should not be made use of without caution — our speech, that is to say, recognizes something which curiously enough it calls “day dreaming.” Day dreams are phantasies. They are very common phenomena, again observable in the normal as well as in the sick, and access to their study is open to everyone in his own person. The most conspicuous feature about these phantastic productions is that they have received the name “day dreams,” for they share neither of the two common elements of dreams. Their name contradicts the relation to the sleeping condition, and as regards the second common element, one does not experience or hallucinate anything, one only imagines it. One knows that it is a phantasy, that one is not seeing but thinking the thing. These day dreams appear in the period before puberty, often as early as the last years of childhood, continue into the years of maturity, are then either given up or retained through life. The content of these phantasies is dominated by very transparent motives. They are scenes and events in which the egoistic, ambitious and power-seeking desires of the individual find satisfaction. With young men the ambition phantasies generally prevail; in women, the erotic, since they have banked their ambition on success in love. But often enough the erotic desire appears in the background with men too; all the heroic deeds and incidents are after all meant only to win the admiration and favor of women. Otherwise these

day dreams are very manifold and undergo changing fates. They are either, each in turn, abandoned after a short time and replaced by a new one, or they are retained, spun out into long stories, and adapted to changes in daily circumstances. They move with the time, so to speak, and receive from it a “time mark” which testifies to the influence of the new situation. They are the raw material of poetic production, for out of his day dreams the poet, with certain transformations, disguises and omissions, makes the situations which he puts into his novels, romances and dramas. The hero of the day dreams, however, is always the individual himself, either directly or by means of a transparent identification with another.

Perhaps day dreams bear this name because of the similarity of their relation to reality, in order to indicate that their content is as little to be taken for real as that of dreams. Perhaps, however, this identity of names does nevertheless rest on a characteristic of the dream which is still unknown to us, perhaps even one of those characteristics which we are seeking. It is possible, on the other hand, that we are wrong in trying to read a meaning into this similarity of designation. Yet that can only be cleared up later.

SIXTH LECTURE. THE DREAM

Hypothesis and Technique of Interpretation

WE must find a new path, a new method, in order to proceed with the investigation of the dream. I shall now make an obvious suggestion. Let us assume as a hypothesis for everything which follows, that *the dream is not a somatic but a psychic phenomenon*. You appreciate the significance of that statement, but what justification have we for making it? None; but that alone need not deter us from making it. The matter stands thus: If the dream is a somatic phenomenon, it does not concern us. It can be of interest to us only on the supposition that it is a *psychic* phenomenon. Let us therefore work upon that assumption in order to see what comes of it. The result of our labor will determine whether we are to hold to this assumption and whether we may, in fact, consider it in turn a result. What is it that we really wish to achieve, to what end are we working? It is what one usually seeks to attain in the sciences, an understanding of phenomena, the creation of relationships between them, and ultimately, if possible, the extension of our control over them.

Let us then proceed with the work on the assumption that the dream is a psychic phenomenon. This makes it an achievement and expression of the dreamer, but one that tells us nothing, one that we do not understand. What do you do when I make a statement you do not understand? You ask for an explanation, do you not? Why may we not do the same thing here, *ask the dreamer to give us the meaning of his dream*?

If you will remember, we were in this same situation once before. It was when we were investigating errors, a case of a slip of the tongue. Someone said: "*Da sind dinge zum vorschwein gekommen*," whereupon we asked — no, luckily, not we, but others, persons in no way associated with psychoanalysis — these persons asked him what he meant by this unintelligible talk. He immediately answered that he had intended to say "*Das waren schweinereien*," but that he had suppressed this intention, in favor of the other, more gentle "*Da sind dinge zum vorschein gekommen*." I explained to you at the time that this inquiry was typical of every psychoanalytical investigation, and now you understand that psychoanalysis follows the technique, as far as possible, of having the

subjects themselves discover the solutions of their riddles. The dreamer himself, then, is to tell us the meaning of his dream.

It is common knowledge, however, that this is not such an easy matter with dreams. In the case of slips, our method worked in a number of cases, but we encountered some where the subject did not wish to say anything — in fact, indignantly rejected the answer that we suggested. Instances of the first method are entirely lacking in the case of dreams; the dreamer always says he knows nothing. He cannot deny our interpretation, for we have none. Shall we then give up the attempt? Since he knows nothing and we know nothing and a third person surely knows nothing, it looks as though there were no possibility of discovering anything. If you wish, discontinue the investigation. But if you are of another mind, you can accompany me on the way. For I assure you, it is very possible, in fact, probable, that the dreamer does know what his dream means, but does *not know that he knows, and therefore believes he does not know.*

You will point out to me that I am again making an assumption, the second in this short discourse, and that I am greatly reducing the credibility of my claim. On the assumption that the dream is a psychic phenomenon, on the further assumption that there are unconscious things in man which he knows without knowing that he knows, etc. — we need only realize clearly the intrinsic improbability of each of these two assumptions, and we shall calmly turn our attention from the conclusions to be derived from such premises.

Yet, ladies and gentlemen, I have not invited you here to delude you or to conceal anything from you. I did, indeed, announce a *General Introduction to Psychoanalysis*, but I did not intend the title to convey that I was an oracle, who would show you a finished product with all the difficulties carefully concealed, all the gaps filled in and all the doubts glossed over, so that you might peacefully believe you had learned something new. No, precisely because you are beginners, I wanted to show you our science as it is, with all its hills and pitfalls, demands and considerations. For I know that it is the same in all sciences, and must be so in their beginnings particularly. I know, too, that teaching as a rule endeavors to hide these difficulties and these incompletely developed phases from the student. But that will not do in psychoanalysis. I have, as a matter of fact, made two assumptions, one within the other, and he who finds the whole too troublesome and too uncertain or is accustomed to

greater security or more elegant derivations, need go no further with us. What I mean is, he should leave psychological problems entirely alone, for it must be apprehended that he will not find the sure and safe way he is prepared to go, traversable. Then, too, it is superfluous for a science that has something to offer to plead for auditors and adherents. Its results must create its atmosphere, and it must then bide its time until these have attracted attention to themselves.

I would warn those of you, however, who care to continue, that my two assumptions are not of equal worth. The first, that the dream is a psychic phenomenon, is the assumption we wish to prove by the results of our work. The other has already been proved in another field, and I take the liberty only of transferring it from that field to our problem.

Where, in what field of observation shall we seek the proof that there is in man a knowledge of which he is not conscious, as we here wish to assume in the case of the dreamer? That would be a remarkable, a surprising fact, one which would change our understanding of the psychic life, and which would have no need to hide itself. To name it would be to destroy it, and yet it pretends to be something real, a contradiction in terms. Nor does it hide itself. It is no result of the fact itself that we are ignorant of its existence and have not troubled sufficiently about it. That is just as little our fault as the fact that all these psychological problems are condemned by persons who have kept away from all observations and experiments which are decisive in this respect.

The proof appeared in the field of hypnotic phenomena. When, in the year 1889, I was a witness to the extraordinarily enlightening demonstrations of Siebault and Bernheim in Nancy, I witnessed also the following experiment: If one placed a man in the somnambulistic state, allowed him to have all manner of hallucinatory experience, and then woke him up, it appeared in the first instance that he knew nothing about what had happened during his hypnotic sleep. Bernheim then directly invited him to relate what had happened to him during the hypnosis. He maintained he was unable to recall anything. But Bernheim insisted, he persisted, he assured him he did know, that he must recall, and, incredible though it may seem, the man wavered, began to rack his memory, recalled in a shadowy way first one of the suggested experiences, then another; the recollection became more and more complete and finally was brought forth without a gap. The fact that he had this knowledge finally, and that he

had had no experiences from any other source in the meantime, permits the conclusion that he knew of these recollections in the beginning. They were merely inaccessible, he did not know that he knew them; he believed he did not know them. This is exactly what we suspect in the dreamer.

I trust you are taken by surprise by the establishment of this fact, and that you will ask me why I did not refer to this proof before in the case of the slips, where we credited the man who made a mistake in speech with intentions he knew nothing about and which he denied. “If a person believes he knows nothing concerning experiences, the memory of which, however, he retains,” you might say, “it is no longer so improbable that there are also other psychic experiences within him of whose existence he is ignorant. This argument would have impressed us and advanced us in the understanding of errors.” To be sure, I might then have referred to this but I reserved it for another place, where it was more necessary. Errors have in a measure explained themselves, have, in part, furnished us with the warning that we must assume the existence of psychic processes of which we know nothing, for the sake of the connection of the phenomena. In dreams we are compelled to look to other sources for explanations; and besides, I count on the fact that you will permit the inference I draw from hypnotism more readily in this instance. The condition in which we make mistakes most seem to you to be the normal one. It has no similarity to the hypnotic. On the other hand, there is a clear relationship between the hypnotic state and sleep, which is the essential condition of dreams. Hypnotism is known as artificial sleep; we say to the person whom we hypnotize, “Sleep,” and the suggestions which we throw out are comparable to the dreams of natural sleep. The psychical conditions are in both cases really analogous. In natural sleep we withdraw our attention from the entire outside world; in the hypnotic, on the other hand, from the whole world with the exception of the one person who has hypnotized us, with whom we remain in touch. Furthermore, the so-called nurse’s sleep in which the nurse remains in touch with the child, and can be waked only by him, is a normal counterpart of hypnotism. The transference of one of the conditions of hypnotism to natural sleep does not appear to be such a daring proceeding. The inferential assumption that there is also present in the case of the dreamer a knowledge of his dream, a knowledge which is so inaccessible that he does not believe it himself, does not seem to be made out of whole cloth. Let us note that at this point there appears a third

approach to the study of the dream; from the sleep-disturbing stimuli, from the day-dreams, and now in addition, from the suggested dreams of the hypnotic state.

Now we return, perhaps with increased faith, to our problem. Apparently it is very probable that the dreamer knows of his dream; the question is, how to make it possible for him to discover this knowledge, and to impart it to us? We do not demand that he give us the meaning of his dream at once, but he will be able to discover its origin, the thought and sphere of interest from which it springs. In the case of the errors, you will remember, the man was asked how he happened to use the wrong word, "*vorschwein,*" and his next idea gave us the explanation. Our dream technique is very simple, an imitation of this example. We again ask how the subject happened to have the dream, and his next statement is again to be taken as an explanation. We disregard the distinction whether the dreamer believes or does not believe he knows, and treat both cases in the same way.

This technique is very simple indeed, but I am afraid it will arouse your sharpest opposition. You will say, "a new assumption. The third! And the most improbable of all! If I ask the dreamer what he considers the explanation of his dream to be, his very next association is to be the desired explanation? But it may be he thinks of nothing at all, or his next thought may be anything at all. We cannot understand upon what we can base such anticipation. This, really, is putting too much faith in a situation where a slightly more critical attitude would be more suitable. Furthermore, a dream is not an isolated error, but consists of many elements. To which idea should we pin our faith?"

You are right in all the non-essentials. A dream must indeed be distinguished from a word slip, even in the number of its elements. The technique is compelled to consider this very carefully. Let me suggest that we separate the dream into its elements, and carry on the investigation of each element separately; then the analogy to the word-slip is again set up. You are also correct when you say that in answer to the separate dream elements no association may occur to the dreamer. There are cases in which we accept this answer, and later you will hear what those cases are. They are, oddly enough, cases in which we ourselves may have certain associations. But in general we shall contradict the dreamer when he maintains he has no associations. We shall insist that he must have some

association and — we shall be justified. He will bring forth some association, any one, it makes no difference to us. He will be especially facile with certain information which might be designated as historical. He will say, “that is something that happened yesterday” (as in the two “prosaic” dreams with which we are acquainted); or, “that reminds me of something that happened recently,” and in this manner we shall notice that the act of associating the dreams with recent impressions is much more frequent than we had at first supposed. Finally, the dreamer will remember occurrences more remote from the dream, and ultimately even events in the far past.

But in the essential matters you are mistaken. If you believe that we assume arbitrarily that the dreamer’s next association will disclose just what we are seeking, or must lead to it, that on the contrary the association is just as likely to be entirely inconsequential, and without any connection with what we are seeking, and that it is an example of my unbounded optimism to expect anything else, then you are greatly mistaken. I have already taken the liberty of pointing out that in each one of you there is a deep-rooted belief in psychic freedom and volition, a belief which is absolutely unscientific, and which must capitulate before the claims of a determinism that controls even the psychic life. I beg of you to accept it as a fact that only this one association will occur to the person questioned. But I do not put one belief in opposition to another. It can be proved that the association, which the subject produces, is not voluntary, is not indeterminable, not unconnected with what we seek. Indeed, I discovered long ago — without, however, laying too much stress on the discovery — that even experimental psychology has brought forth this evidence.

I ask you to give your particular attention to the significance of this subject. If I invite a person to tell me what occurs to him in relation to some certain element of his dream I am asking him to abandon himself to free association, *controlled by a given premise*. This demands a special delimitation of the attention, quite different from cogitation, in fact, exclusive of cogitation. Many persons put themselves into such a state easily; others show an extraordinarily high degree of clumsiness. There is a higher level of free association again, where I omit this original premise and designate only the manner of the association, e.g., rule that the subject freely give a proper name or a number. Such an association would be more voluntary, more indeterminable, than the one called forth by our technique.

But it can be shown that it is strongly determined each time by an important inner mental set which, at the moment at which it is active, is unknown to us, just as unknown as the disturbing tendencies in the case of errors and the provocative tendencies in the case of accidental occurrences.

I, and many others after me, have again and again instigated such investigations for names and numbers which occur to the subject without any restraint, and have published some results. The method is the following: Proceeding from the disclosed names, we awaken continuous associations which then are no longer entirely free, but rather are limited as are the associations to the dream elements, and this is true until the impulse is exhausted. By that time, however, the motivation and significance of the free name associations is explained. The investigations always yield the same results, the information often covers a wealth of material and necessitates lengthy elaboration. The associations to freely appearing numbers are perhaps the most significant. They follow one another so quickly and approach a hidden goal with such inconceivable certainty, that it is really startling. I want to give you an example of such a name analysis, one that, happily, involves very little material.

In the course of my treatment of a young man, I referred to this subject and mentioned the fact that despite the apparent volition it is impossible to have a name occur which does not appear to be limited by the immediate conditions, the peculiarities of the subject, and the momentary situation. He was doubtful, and I proposed that he make such an attempt immediately. I know he has especially numerous relations of every sort with women and girls, and so am of the opinion that he will have an unusually wide choice if he happens to think of a woman’s name. He agrees. To my astonishment, and perhaps even more to his, no avalanche of women’s names descends upon my head, but he is silent for a time, and then admits that a single name has occurred to him — and no other: *Albino*. How extraordinary, but what associations have you with this name? How many albinoes do you know? Strangely enough, he knew no albinoes, and there were no further associations with the name. One might conclude the analysis had proved a failure; but no — it was already complete; no further association was necessary. The man himself had unusually light coloring. In our talks during the cure I had frequently called him an albino in fun. We were at the time occupied in determining

the feminine characteristics of his nature. He himself was the Albino, who at that moment was to him the most interesting feminine person.

In like manner, melodies, which come for no reason, show themselves conditioned by and associated with a train of thought which has a right to occupy one, yet of whose activity one is unconscious. It is easily demonstrable that the attraction to the melody is associated with the text, or its origin. But I must take the precaution not to include in this assertion really musical people, with whom, as it happens, I have had no experience. In their cases the musical meaning of the melody may have occasioned its occurrence. More often the first reason holds. I know of a young man who for a time was actually haunted by the really charming melody of the song of Paris, from *The Beautiful Helen*, until the analysis brought to his attention the fact that at that time his interest was divided between an Ida and a Helen.

If then the entirely unrestrained associations are conditioned in such a manner and are arranged in a distinct order, we are justified in concluding that associations with a single condition, that of an original premise, or starting point, may be conditioned to no less degree. The investigation does in fact show that aside from the conditioning which we have established by the premise, a second farther dependence is recognizable upon powerful affective thoughts, upon cycles of interest and complexes of whose influence we are ignorant, therefore unconscious at the time.

Associations of this character have been the subject matter of very enlightening experimental investigations, which have played a noteworthy role in the history of psychoanalysis. The Wundt school proposed the so-called association-experiment, wherein the subject is given the task of answering in the quickest possible time, with any desired reaction, to a given stimulus-word. It is then possible to study the interval of time that elapses between the stimulus and the reaction, the nature of the answer given as reaction, the possible mistake in a subsequent repetition of the same attempt, and similar matters. The Zurich School under the leadership of Bleuler and Jung, gave the explanation of the reactions following the association-experiment, by asking the subject to explain a given reaction by means of further associations, in the cases where there was anything extraordinary in the reaction. It then became apparent that these extraordinary reactions were most sharply determined by the complexes of

the subject. In this matter Bleuler and Jung built the first bridge from experimental psychology to psychoanalysis.

Thus instructed, you will be able to say, “We recognize now that free associations are predetermined, not voluntary, as we had believed. We admit this also as regards the associations connected with the elements of the dream, but that is not what we are concerned with. You maintain that the associations to the dream element are determined by the unknown psychic background of this very element. We do not think that this is a proven fact. We expect, to be sure, that the association to the dream element will clearly show itself through one of the complexes of the dreamer, but what good is that to us? That does not lead us to understand the dream, but rather, as in the case of the association-experiment, to a knowledge of the so-called complexes. What have these to do with the dream?”

You are right, but you overlook one point, in fact, the very point because of which I did not choose the association-experiment as the starting point for this exposition. In this experiment the one determinate of the reaction, viz., the stimulus word, is voluntarily chosen. The reaction is then an intermediary between this stimulus word and the recently aroused complex of the subject. In the dream the stimulus word is replaced by something that itself has its origin in the psychic life of the dreamer, in sources unknown to him, hence very likely itself a product of the complex. It is not an altogether fantastic hypothesis, then, that the more remote associations, even those that are connected with the dream element, are determined by no other complex than the one which determines the dream element itself, and will lead to the disclosure of the complex.

Let me show you by another case that the situation is really as we expect it to be. Forgetting proper names is really a splendid example for the case of dream analysis; only here there is present in one person what in the dream interpretation is divided between two persons. Though I have forgotten a name temporarily I still retain the certainty that I know the name; that certainty which we could acquire for the dreamer only by way of the Bernheim experiment. The forgotten name, however, is not accessible. Cogitation, no matter how strenuous, does not help. Experience soon tells me that. But I am able each time to find one or more substitute names for the forgotten name. If such a substitute name occurs to me spontaneously then the correspondence between this situation and that of

the dream analysis first becomes evident. Nor is the dream element the real thing, but only a substitute for something else, for what particular thing I do not know, but am to discover by means of the dream analysis. The difference lies only in this, that in forgetting a name I recognize the substitute automatically as unsuitable, while in the dream element we must acquire this interpretation with great labor. When a name is forgotten, too, there is a way to go from the substitute to the unknown reality, to arrive at the forgotten name. If I centre my attention on the substitute name and allow further associations to accumulate, I arrive in a more or less roundabout way at the forgotten name, and discover that the spontaneous substitute names, together with those called up by me, have a certain connection with the forgotten name, were conditioned by it.

I want to show you an analysis of this type. One day I noticed that I could not recall the name of the little country in the Riviera of which Monte Carlo is the capital. It is very annoying, but it is true. I steep myself in all my knowledge about this country, think of Prince Albert, of the house of Lusignan, of his marriages, his preference for deep-sea study, and anything else I can think of, but to no avail. So I give up the thinking, and in place of the lost name allow substitute names to suggest themselves. They come quickly — Monte Carlo itself, then Piedmont, Albania, Montevideo, Colico. Albania is the first to attract my attention, it is replaced by Montenegro, probably because of the contrast between black and white. Then I see that four of these substitutes contain the same syllable *mon*. I suddenly have the forgotten word, and cry aloud, "*Monaco*." The substitutes really originated in the forgotten word, the four first from the first syllable, the last brings back the sequence of syllables and the entire final syllable. In addition, I am also able easily to discover what it was that took the name from my memory for a time. Monaco is also the Italian name of Munich; this latter town exerted the inhibiting influence.

The example is pretty enough, but too simple. In other cases we must add to the first substitute names a long line of associations, and then the analogy to the dream interpretation becomes clearer. I have also had such experiences. Once when a stranger invited me to drink Italian wine with him, it so happened in the hostelry that he forgot the name of the wine he had intended to order just because he had retained a most pleasant memory of it. Out of a profusion of dissimilar substitute associations which came

to him in the place of the forgotten name, I was able to conclude that the memory of some one named Hedwig had deprived him of the name of the wine, and he actually confirmed not only that he had first tasted this wine in the company of a Hedwig, but he also, as a result of this declaration, recollected the name again. He was at the time happily married, and this Hedwig belonged to former times, not now recalled with pleasure.

What is possible in forgetting names must work also in dream interpretation, viz., making the withheld actuality accessible by means of substitutions and through connecting associations. As exemplified by name-forgetting, we may conclude that in the case of the associations to the dream element they will be determined as well by the dream element as by its unknown essential. Accordingly, we have advanced a few steps in the formulation of our dream technique.

SEVENTH LECTURE. THE DREAM

Manifest Dream Content and Latent Dream Thought

WE have not studied the problem of errors in vain. Thanks to our efforts in this field, under the conditions known to you, we have evolved two different things, a conception of the elements of the dream and a technique for dream interpretation. The conception of the dream element goes to show something unreal, a substitute for something else, unknown to the dreamer, similar to the tendency of errors, a substitute for something the dreamer knows but cannot approach. We hope to transfer the same conception to the whole dream, which consists of just such elements. Our method consists of calling up, by means of free associations, other substitute formations in addition to these elements, from which we divine what is hidden.

Let me ask you to permit a slight change in our nomenclature which will greatly increase the flexibility of our vocabulary. Instead of hidden, unapproachable, unreal, let us give a truer description and say inaccessible or unknown to the consciousness of the dreamer. By this we mean only what the connection with the lost word or with the interfering intention of the error can suggest to you, namely, unconscious *for the time being*. Naturally in contrast to this we may term *conscious* the elements of the dream itself and the substitute formations just gained by association. As yet there is absolutely no theoretical construction implied in this nomenclature. The use of the word unconscious as a suitable and intelligible descriptive epithet is above criticism.

If we transfer our conception from a single element to the entire dream, we find that the dream as a whole is a distorted substitute for something else, something unconscious. To discover this unconscious thing is the task of dream interpretation. From this, three important rules, which we must observe in the work of dream interpretation, are straightway derived:

1. What the dream seems to say, whether it be sensible or absurd, clear or confused is not our concern, since it can under no condition be that unconscious content we are seeking. Later we shall have to observe an obvious limitation of this rule. 2. The awakening of substitute formations for each element shall be the sole object of our work. We shall not reflect on these, test their suitability or trouble how far they lead away from the

element of the dream. 3. We shall wait until the hidden unconscious we are seeking appears of itself, as the missing word *Monaco* in the experiment which we have described.

Now we can understand, too, how unimportant it is how much, how little, above all, how accurately or how indifferently the dream is remembered. For the dream which is remembered is not the real one, but a distorted substitute, which is to help us approach the real dream by awakening other substitute formations and by making the unconscious in the dream conscious. Therefore if our recollection of the dream was faulty, it has simply brought about a further distortion of this substitute, a distortion which cannot, however, be unmotivated.

One can interpret one's own dreams as well as those of others. One learns even more from these, for the process yields more proof. If we try this, we observe that something impedes the work. Haphazard ideas arise, but we do not let them have their way. Tendencies to test and to choose make themselves felt. As an idea occurs, we say to ourselves "No, that does not fit, that does not belong here"; of a second "that is too senseless"; of a third, "this is entirely beside the point"; and one can easily observe how the ideas are stifled and suppressed by these objections, even before they have become entirely clear. On the one hand, therefore, too much importance is attached to the dream elements themselves; on the other, the result of free association is vitiated by the process of selection. If you are not interpreting the dream alone, if you allow someone else to interpret it for you, you will soon discover another motive which induces you to make this forbidden choice. At times you say to yourself, "No, this idea is too unpleasant, I either will not or cannot divulge this."

Clearly these objections are a menace to the success of our work. We must guard against them, in our own case by the firm resolve not to give way to them; and in the interpretation of the dreams of others by making the hard and fast rule for them, never to omit any idea from their account, even if one of the following four objections should arise: that is, if it should seem too unimportant, absurd, too irrelevant or too embarrassing to relate. The dreamer promises to obey this rule, but it is annoying to see how poorly he keeps his promise at times. At first we account for this by supposing that in spite of the authoritative assurance which has been given to the dreamer, he is not impressed with the importance of free association, and plan perhaps to win his theoretic approval by giving him

papers to read or by sending him to lectures which are to make him a disciple of our views concerning free association. But we are deterred from such blunders by the observation that, in one's own case, where convictions may certainly be trusted, the same critical objections arise against certain ideas, and can only be suppressed subsequently, upon second thought, as it were.

Instead of becoming vexed at the disobedience of the dreamer, these experiences can be turned to account in teaching something new, something which is the more important the less we are prepared for it. We understand that the task of interpreting dreams is carried on against a certain *resistance* which manifests itself by these critical objections. This resistance is independent of the theoretical conviction of the dreamer. Even more is apparent. We discover that such a critical objection is never justified. On the contrary, those ideas which we are so anxious to suppress, prove *without exception* to be the most important, the most decisive, in the search for the unconscious. It is even a mark of distinction if an idea is accompanied by such an objection.

This resistance is something entirely new, a phenomenon which we have found as a result of our hypotheses although it was not originally included in them. We are not too pleasantly surprised by this new factor in our problem. We suspect that it will not make our work any easier. It might even tempt us to abandon our entire work in connection with the dream. Such an unimportant thing as the dream and in addition such difficulties instead of a smooth technique! But from another point of view, these same difficulties may prove fascinating, and suggest that the work is worth the trouble. Whenever we try to penetrate to the hidden unconscious, starting out from the substitute which the dream element represents, we meet with resistance. Hence, we are justified in supposing that something of weight must be hidden behind the substitute. What other reason could there be for the difficulties which are maintained for purposes of concealment? If a child does not want to open his clenched fist, he is certainly hiding something he ought not to have.

Just as soon as we bring the dynamic representation of resistance into our consideration of the case, we must realize that this factor is something quantitatively variable. There may be greater or lesser resistances and we are prepared to see these differences in the course of our work. We may perhaps connect this with another experience found in the work of dream

interpretation. For sometimes only one or two ideas serve to carry us from the dream element to its unconscious aspect, while at other times long chains of associations and the suppression of many critical objections are necessary. We shall note that these variations are connected with the variable force of resistance. This observation is probably correct. If resistance is slight, then the substitute is not far removed from the unconscious, but strong resistance carries with it a great distortion of the unconscious and in addition a long journey back to it.

Perhaps the time has come to take a dream and try out our method to see if our faith in it shall be confirmed. But which dream shall we choose? You cannot imagine how hard it is for me to decide, and at this point I cannot explain the source of the difficulty. Of course, there must be dreams which, as a whole, have suffered slight distortion, and it would be best to start with one of these. But which dreams are the least distorted? Those which are sensible and not confused, of which I have already given you two examples? This would be a gross misunderstanding. Testing shows that these dreams have suffered by distortion to an exceptionally high degree. But if I take the first best dream, regardless of certain necessary conditions, you would probably be very much disappointed. Perhaps we should have to note such an abundance of ideas in connection with single elements of dream that it would be absolutely impossible to review the work in perspective. If we write the dream out and confront it with the written account of all the ideas which arise in connection with it, these may easily amount to a reiteration of the text of the dream. It would therefore seem most practical to choose for analysis several short dreams of which each one can at least reveal or confirm something. This is what we shall decide upon, provided experience should not point out where we shall really find slightly distorted dreams.

But I know of another way to simplify matters, one which, moreover, lies in our path. Instead of attempting the interpretation of entire dreams, we shall limit ourselves to single dream elements and by observing a series of examples we shall see how these are explained by the application of our method.

1. A lady relates that as a child she often dreamt “*that God had a pointed paper hat on his head*.” How do you expect to understand that without the help of the dreamer? Why, it sounds quite absurd. It is no longer absurd when the lady testifies that as a child she was frequently

made to wear such a hat at the table, because she could not help stealing glances at the plates of her brothers and sisters to see if one of them had gotten more than she. The hat was therefore supposed to act as a sort of blinder. This explanation was moreover historic, and given without the least difficulty. The meaning of this fragment and of the whole brief dream, is clear with the help of a further idea of the dreamer. “Since I had heard that God was all-knowing and all-seeing,” she said, “the dream can only mean that I know everything and see everything just as God does, even when they try to prevent me.” This example is perhaps too simple.

2. A sceptical patient has a longer dream, in which certain people happen to tell her about my book concerning laughter and praise it highly. Then something is mentioned about a certain “‘*canal,’ perhaps another book in which ‘canal’ occurs, or something else with the word ‘canal’ ... she doesn’t know ... it is all confused*.”

Now you will be inclined to think that the element “canal” will evade interpretation because it is so vague. You are right as to the supposed difficulty, but it is not difficult because it is vague, but rather it is vague for a different reason, the same reason which also makes the interpretation difficult. The dreamer can think of nothing concerning the word canal, I naturally can think of nothing. A little while later, as a matter of fact on the next day, she tells me that something occurred to her that *may perhaps* be related to it, a joke that she has heard. On a ship between Dover and Calais a well-known author is conversing with an Englishman, who quoted the following proverb in a certain connection: “*Du sublime au ridicule, il n’y a qu’un pas*.” The author answers, “*Oui, le pas de Calais*,” with which he wishes to say that he finds France sublime and England ridiculous. But the “*Pas de Calais*” is really a canal, namely, the English Channel. Do I think that this idea has anything to do with the dream? Certainly, I believe that it really gives the solution to the puzzling dream fragments. Or can you doubt that this joke was already present in the dream, as the unconscious factor of the element, “canal.” Can you take it for granted that it was subsequently added to it? The idea testifies to the scepticism which is concealed behind her obtrusive admiration, and the resistance is probably the common reason for both phenomena, for the fact that the idea came so hesitatingly and that the decisive element of the dream turned out to be so vague. Kindly observe at this point the relation of the dream

element to its unconscious factor. It is like a small part of the unconscious, like an allusion to it; through its isolation it became quite unintelligible.

3. A patient dreams, in the course of a longer dream: "*Around a table of peculiar shape several members of his family are sitting, etc.*" In connection with this table, it occurs to him that he saw such a piece of furniture during a visit to a certain family. Then his thoughts continue: In this family a peculiar relation had existed between father and son, and soon he adds to this that as a matter of fact the same relation exists between himself and his father. The table is therefore taken up into the dream to designate this parallel.

This dreamer had for a long time been familiar with the claims of dream interpretation. Otherwise he might have taken exception to the fact that so trivial a detail as the shape of a table should be taken as the basis of the investigation. As a matter of fact we judge nothing in the dream as accidental or indifferent, and we expect to reach our conclusion by the explanation of just such trivial and unmotivated details. Perhaps you will be surprised that the dream work should arouse the thought "we are in exactly the same position as they are," just by the choice of the table. But even this becomes clear when you learn that the name of the family in question is *Tischler*. By permitting his own family to sit at such a table, he intends to express that they too are *Tischler*. Please note how, in relating such a dream interpretation, one must of necessity become indiscreet. Here you have arrived at one of the difficulties in the choice of examples that I indicated before. I could easily have substituted another example for this one, but would probably have avoided this indiscretion at the cost of committing another one in its place.

The time has come to introduce two new terms, which we could have used long ago. We shall call that which the dream relates, the manifest content of the dream; that which is hidden, which we can only reach by the analysis of ideas we shall call latent dream thoughts. We may now consider the connection between the manifest dream content and the latent dream thoughts as they are revealed in these examples. Many different connections can exist. In examples 1 and 2 the manifest content is also a constituent part of the latent thought, but only a very small part of it. A small piece of a great composite psychic structure in the unconscious dream thought has penetrated into the manifest dream, like a fragment of it, or in other cases, like an allusion to it, like a catchword or an

abbreviation in the telegraphic code. The interpretation must mould this fragment, or indication, into a whole, as was done most successfully in example 2. One sort of distortion of which the dream mechanism consists is therefore substitution by means of a fragment or an allusion. In the third, moreover, we must recognize another relation which we shall see more clearly and distinctly expressed in the following examples:

4. The dreamer "*pulls a certain woman of his acquaintance from behind a bed*." He finds the meaning of this dream element himself by his first association. It means: This woman "has a pull" with him.

5. Another man dreams that "*his brother is in a closet*." The first association substitutes *clothes-press* for closet, and the second gives the meaning: his brother is *close-pressed* for money.

6. The dreamer "*climbs a mountain from the top of which he has an extraordinarily distant view*." This sounds quite sensible; perhaps there is nothing about it that needs interpretation, and it is simply necessary to find out which reminiscence this dream touches upon and why it was recalled. But you are mistaken; it is evident that this dream requires interpretation as well as any other which is confused. For no previous mountain climbing of his own occurs to the dreamer, but he remembers that an acquaintance of his is publishing a "*Rundschau*," which deals with our relation to the furthermost parts of the earth. The latent dream thought is therefore in this case an identification of the dreamer with the "*Rundschauer*."

Here you find a new type of connection between the manifest content and the latent dream element. The former is not so much a distortion of the latter as a representation of it, a plastic concrete perversion that is based on the sound of the word. However, it is for this very reason again a distortion, for we have long ago forgotten from which concrete picture the word has arisen, and therefore do not recognize it by the image which is substituted for it. If you consider that the manifest dream consists most often of visual images, and less frequently of thoughts and words, you can imagine that a very particular significance in dream formation is attached to this sort of relation. You can also see that in this manner it becomes possible to create substitute formations for a great number of abstract thoughts in the manifest dream, substitutions that serve the purpose of further concealment all the same. This is the technique of our picture puzzle. What the origin is of the semblance of wit which accompanies

such representations is a particular question which we need not touch upon at this time.

A fourth type of relation between the manifest and the latent dream cannot be dealt with until its cue in the technique has been given. Even then I shall not have given you a complete enumeration, but it will be sufficient for our purpose.

Have you the courage to venture upon the interpretation of an entire dream? Let us see if we are well enough equipped for this undertaking. Of course, I shall not choose one of the most obscure, but one nevertheless that shows in clear outline the general characteristics of a dream.

A young woman who has been married for many years dreams: "*She is sitting in the theatre with her husband; one side of the orchestra is entirely unoccupied. Her husband tells her that Elise L. and her bridegroom had also wished to come, but had only been able to procure poor seats, three for* 1 *Fl.,* 50 *Kr. and those of course they could not take. She thinks this is no misfortune for them.*"

The first thing that the dreamer has to testify is that the occasion for the dream is touched upon in its manifest content. Her husband had really told her that Elise L., an acquaintance of about her age, had become engaged. The dream is the reaction to this news. We already know that in the case of many dreams it is easy to trace such a cause to the preceding day, and that the dreamer often gives these deductions without any difficulty. The dreamer also places at our disposal further information for other parts of the manifest dream content. Whence the detail that one side of the orchestra is unoccupied? It is an allusion to an actual occurrence of the previous week. She had made up her mind to go to a certain performance and had procured tickets in advance, so much in advance that she had been forced to pay a preference tax. When she arrived at the theatre, she saw how needless had been her anxiety, for *one side of the orchestra was almost empty*. She could have bought the tickets on the day of the performance itself. Her husband would not stop teasing her about her excessive haste. Whence the 1 Fl. 50 Kr.? From a very different connection that has nothing to do with the former, but which also alludes to an occurrence of the previous day. Her sister-in-law had received 150 florins as a present from her husband, and knew no better, the poor goose, than to hasten to the jeweler and spend the money on a piece of jewelry. Whence the number 3? She can think of nothing in connection with this unless one

stresses the association that the bride, Elise L., is only three months younger than she herself, who has been married for almost ten years. And the absurdity of buying three tickets for two people? She says nothing of this, and indeed denies all further associations or information.

But she has given us so much material in her few associations, that it becomes possible to derive the latent dream thought from it. It must strike us that in her remarks concerning the dream, time elements which constitute a common element in the various parts of this material appear at several points. She attended to the tickets *too soon*, took them *too hastily*, so that she had to pay more than usual for them; her sister-in-law likewise *hastened* to carry her money to the jeweler's to buy a piece of jewelry, just as if she might *miss* it. Let us add to the expressions "*too early*," "*precipitately*," which are emphasized so strongly, the occasion for the dream, namely, that her friend only three months younger than herself had even now gotten a good husband, and the criticism expressed in the condemnation of her sister-in-law, that it was *foolish* to hurry so. Then the following construction of the latent dream thought, for which the manifest dream is a badly distorted substitute, comes to us almost spontaneously:

"How *foolish* it was of me to hurry so in marrying! Elise's example shows me that I could have gotten a husband later too." (The precipitateness is represented by her own behavior in buying the tickets, and that of her sister-in-law in purchasing jewelry. Going to the theatre was substituted for getting married. This appears to have been the main thought; and perhaps we may continue, though with less certainty, because the analysis in these parts is not supported by statements of the dreamer.) "And I would have gotten 100 times as much for my money." (150 Fl. is 100 times as much as 1 Fl. 50 Kr.). If we might substitute the dowry for the money, then it would mean that one buys a husband with a dowry; the jewelry as well as the poor seats would represent the husband. It would be even more desirable if the fragment "3 seats" had something to do with a husband. But our understanding does not penetrate so far. We have only guessed that the dream expresses her *disparagement* of her own husband, and her regret at having *married so early*.

It is my opinion that we are more surprised and confused than satisfied by the result of this first dream interpretation. We are swamped by more impressions than we can master. We see that the teachings of dream

interpretation are not easily exhausted. Let us hasten to select those points that we recognize as giving us new, sound insight.

In the first place, it is remarkable that in the latent thought the main emphasis falls on the element of haste; in the manifest dream there is absolutely no mention of this to be found. Without the analysis we should not have had any idea that this element was of any importance at all. So it seems possible that just the main thing, the central point of the unconscious thoughts, may be absent in the manifest dream. Because of this, the original impression in the dream must of necessity be entirely changed. Secondly: In the dream there is a senseless combination, 3 for 1 Fl. 50 Kr.; in the dream thought we divine the sentence, “It was senseless (to marry so early).” Can one deny that this thought, “It was senseless,” was represented in the manifest dream by the introduction of an absurd element? Thirdly: Comparison will show that the relation between the manifest and latent elements is not simple, certainly not of such a sort that a manifest element is always substituted for the latent. There must rather be a quantitative relationship between the two groups, according to which a manifest element may represent several latent ones, or a latent element represented by several manifest elements.

Much that is surprising might also be said of the sense of the dream and the dreamer’s reaction to it. She acknowledges the interpretation but wonders at it. She did not know that she disparaged her husband so, and she did not know why she should disparage him to such a degree. There is still much that is incomprehensible. I really believe that we are not yet fully equipped for dream interpretation, and that we must first receive further instruction and preparation.

EIGHTH LECTURE. THE DREAM

Dreams of Childhood

WE think we have advanced too rapidly. Let us go back a little. Before our last attempt to overcome the difficulties of dream distortion through our technique, we had decided that it would be best to avoid them by limiting ourselves only to those dreams in which distortion is either entirely absent or of trifling importance, if there are such. But here again we digress from the history of the evolution of our knowledge, for as a matter of fact we become aware of dreams entirely free of distortion only after the consistent application of our method of interpretation and after complete analysis of the distorted dream.

The dreams we are looking for are found in children. They are short, clear, coherent, easy to understand, unambiguous, and yet unquestionable dreams. But do not think that all children's dreams are like this. Dream distortion makes its appearance very early in childhood, and dreams of children from five to eight years of age have been recorded that showed all the characteristics of later dreams. But if you will limit yourselves to the age beginning with conscious psychic activity, up to the fourth or fifth year, you will discover a series of dreams that are of a so-called infantile character. In a later period of childhood you will be able to find some dreams of this nature occasionally. Even among adults, dreams that closely resemble the typically infantile ones occur under certain conditions.

From these children's dreams we gain information concerning the nature of dreams with great ease and certainty, and we hope it will prove decisive and of universal application.

1. For the understanding of these dreams we need no analysis, no technical methods. We need not question the child that is giving an account of his dream. But one must add to this a story taken from the life of the child. An experience of the previous day will always explain the dream to us. The dream is a sleep-reaction of psychic life upon these experiences of the day.

We shall now consider a few examples so that we may base our further deductions upon them.

a). A boy of 22 months is to present a basket of cherries as a birthday gift. He plainly does so very unwillingly, although they promise him that

he will get some of them himself. The next morning he relates as his dream, "*Hermann eat all cherries*."

b). A little girl of three and a quarter years makes her first trip across a lake. At the landing she does not want to leave the boat and cries bitterly. The time of the trip seems to her to have passed entirely too rapidly. The next morning she says, "*Last night I rode on the lake*." We may add the supplementary fact that this trip lasted longer.

c). A boy of five and a quarter years is taken on an excursion into the Escherntal near Hallstatt. He had heard that Hallstatt lay at the foot of the Dachstein, and had shown great interest in this mountain. From his home in Aussee there was a beautiful view of the Dachstein, and with a telescope one could discern the Simonyhütte upon it. The child had tried again and again to see it through the telescope, with what result no one knew. He started on the excursion in a joyously expectant mood. Whenever a new mountain came in sight the boy asked, "Is that the Dachstein?" The oftener this question was answered in the negative, the more moody he became; later he became entirely silent and would not take part in a small climb to a waterfall. They thought he was overtired, but the next morning, he said quite happily, "*Last night I dreamed that we were in the Simonyhütte*." It was with this expectation, therefore, that he had taken part in the excursion. The only detail he gave was one he had heard before, "you had to climb steps for six hours."

These three dreams will suffice for all the information we desire.

2. We see that children's dreams are not meaningless; they are *intelligible, significant, psychic acts*. You will recall what I represented to you as the medical opinion concerning the dream, the simile of untrained fingers wandering aimlessly over the keys of the piano. You cannot fail to see how decidedly these dreams of childhood are opposed to this conception. But it would be strange indeed if the child brought forth complete psychic products in sleep, while the adult in the same condition contents himself with spasmodic reactions. Indeed, we have every reason to attribute the more normal and deeper sleep to the child.

3. Dream distortion is lacking in these dreams, therefore they need no interpretation. The manifest and latent dreams are merged. *Dream distortion is therefore not inherent in the dream.* I may assume that this relieves you of a great burden. But upon closer consideration we shall have

to admit of a tiny bit of distortion, a certain differentiation between manifest dream content and latent dream thought, even in these dreams.

4. The child's dream is a reaction to an experience of the day, which has left behind it a regret, a longing or an unfulfilled desire. *The dream brings about the direct unconcealed fulfillment of this wish.* Now recall our discussions concerning the importance of the role of external or internal bodily stimuli as disturbers of sleep, or as dream producers. We learned definite facts about this, but could only explain a very small number of dreams in this way. In these children's dreams nothing points to the influence of such somatic stimuli; we cannot be mistaken, for the dreams are entirely intelligible and easy to survey. But we need not give up the theory of physical causation entirely on this account. We can only ask why at the outset we forgot that besides the physical stimuli there are also psychic sleep-disturbing stimuli. For we know that it is these stimuli that commonly cause the disturbed sleep of adults by preventing them from producing the ideal condition of sleep, the withdrawal of interest from the world. The dreamer does not wish to interrupt his life, but would rather continue his work with the things that occupy him, and for this reason he does not sleep. The unfulfilled wish, to which he reacts by means of the dream, is the psychic sleep-disturbing stimulus for the child.

5. From this point we easily arrive at an explanation of the function of the dream. The dream, as a reaction to the psychic stimulus, must have the value of a release of this stimulus which results in its elimination and in the continuation of sleep. We do not know how this release is made possible by the dream, but we note that *the dream is not a disturber of sleep,* as calumny says, *but a guardian of sleep, whose duty it is to quell disturbances*. It is true, we think we would have slept better if we had not dreamt, but here we are wrong; as a matter of fact, we would not have slept at all without the help of the dream. That we have slept so soundly is due to the dream alone. It could not help disturbing us slightly, just as the night watchman often cannot avoid making a little noise while he drives away the rioters who would awaken us with their noise.

6. One main characteristic of the dream is that a wish is its source, and that the content of the dream is the gratification of this wish. Another equally constant feature is that the dream does not merely express a thought, but also represents the fulfillment of this wish in the form of a hallucinatory experience. "*I should like to travel on the lake*," says the

wish that excites the dream; the dream itself has as its content "*I travel on the lake*." One distinction between the latent and manifest dream, a distortion of the latent dream thought, therefore remains even in the case of these simple children's dreams, namely, *the translation of the thought into experience*. In the interpretation of the dream it is of utmost importance that this change be traced back. If this should prove to be an extremely common characteristic of the dream, then the above mentioned dream fragment, "*I see my brother in a closet*" could not be translated, "*My brother is close-pressed*," but rather, "I wish that my brother were close-pressed, *my brother should be close-pressed*." Of the two universal characteristics of the dream we have cited, the second plainly has greater prospects of unconditional acknowledgment than the first. Only extensive investigation can ascertain that the cause of the dream must always be a wish, and cannot also be an anxiety, a plan or a reproach; but this does not alter the other characteristic, that the dream does not simply reproduce the stimulus but by experiencing it anew, as it were, removes, expells and settles it.

7. In connection with these characteristics of the dream we can again resume the comparison between the dream and the error. In the case of the latter we distinguish an interfering tendency and one interfered with, and the error is the compromise between the two. The dream fits into the same scheme. The tendency interfered with, in this case, can be no other than that of sleep. For the interfering tendency we substitute the psychic stimulus, the wish which strives for its fulfillment, let us say, for thus far we are not familiar with any other sleep-disturbing psychic stimulus. In this instance also the dream is the result of compromise. We sleep, and yet we experience the removal of a wish; we gratify the wish, but at the same time continue to sleep. Both are partly carried out and partly given up.

8. You will remember that we once hoped to gain access to the understanding of the dream problem by the fact that certain very transparent phantasy formations are called *day dreams*. Now these day dreams are actual wish fulfillments, fulfillments of ambitious or erotic wishes with which we are familiar; but they are conscious, and though vividly imagined, they are never hallucinatory experiences. In this instance, therefore, the less firmly established of the two main characteristics of the dream holds, while the other proves itself entirely dependent upon the condition of sleep and impossible to the waking state.

In colloquial usage, therefore, there is a presentment of the fact that the fulfillment of a wish is a main characteristic of the dream. Furthermore, if the experience in the dream is a transformed representation only made possible by the condition of sleep — in other words, a sort of nocturnal day dream — then we can readily understand that the occurrence of phantasy formations can release the nocturnal stimulus and bring satisfaction. For day dreaming is an activity closely bound up in gratification and is, indeed, pursued only for this reason.

Not only this but other colloquial usages also express the same feeling. Well-known proverbs say, “The pig dreams of acorns, the goose of maize,” or ask, “Of what does the hen dream? Of millet.” So the proverb descends even lower than we do, from the child to the animal, and maintains that the content of a dream is the satisfaction of a need. Many turns of speech seem to point to the same thing— “dreamlike beauty,” “I should never have dreamed of that,” “in my wildest dreams I hadn’t imagined that.” This is open partisanship on the part of colloquial usage. For there are also dreams of fear and dreams of embarrassing or indifferent content, but they have not been drawn into common usage. It is true that common usage recognizes “bad” dreams, but still the dream plainly connotates to it only the beautiful wish fulfillment. There is indeed no proverb that tells us that the pig or the goose dreams of being slaughtered.

Of course it is unbelievable that the wish-fulfillment characteristic has not been noted by writers on the dream. Indeed, this was very often the case, but none of them thought of acknowledging this characteristic as universal and of making it the basis of an explanation of the dream. We can easily imagine what may have deterred them and shall discuss it subsequently.

See what an abundance of information we have gained, with almost no effort, from the consideration of children’s dreams — the function of the dream as a guardian of sleep; its origin from two rival tendencies, of which the one, the longing for sleep, remains constant, while the other tries to satisfy a psychic stimulus; the proof that the dream is a significant psychic act; its two main characteristics: wish fulfillment and hallucinatory experience. And we were almost able to forget that we are engaged in psychoanalysis. Aside from its connection with errors our work has no specific connotation. Any psychologist, who is entirely ignorant of

the claims of psychoanalysis, could have given this explanation of children's dreams. Why has no one done so?

If there were only infantile dreams, our problem would be solved, our task accomplished, and that without questioning the dreamer, or approaching the unconscious, and without taking free association into consideration. The continuation of our task plainly lies in this direction. We have already repeatedly had the experience that characteristics that at first seemed universally true, have subsequently held good only for a certain kind and for a certain number of dreams. It is therefore for us to decide whether the common characteristics which we have gathered from children's dreams can be applied universally, whether they also hold for those dreams that are not transparent, whose manifest content shows no connection with wishes left over from the previous day. We think that these dreams have undergone considerable distortion and for this reason are not to be judged superficially. We also suspect that for the explanation of this distortion we shall need the psychoanalytic method which we could dispense with in the understanding of children's dreams.

There is at any rate a class of dreams that are undistorted, and, just like children's dreams, are easily recognizable as wish fulfillments. It is those that are called up throughout life by the imperative needs of the body — hunger, thirst, sexual desire — hence wish fulfillments in reaction to internal physical stimuli. For this reason, I have noted the dream of a young girl, that consisted of a menu following her name (Anna F....., strawberry, huckleberry, egg-dish, pap), as a reaction to an enforced day of fasting on account of a spoiled stomach, which was directly traceable to the eating of the fruits twice mentioned in the dream. At the same time, the grandmother, whose age added to that of her grandchild would make a full seventy, had to go without food for a day on account of kidney-trouble, and dreamed the same night that she had been invited out and that the finest tid-bits had been set before her. Observations with prisoners who are allowed to go hungry, or with people who suffer privations on travels or expeditions, show that under these conditions the dreams regularly deal with the satisfaction of these needs. Otto Nordenskjold, in his book *Antarctic* (1904), testifies to the same thing concerning his crew, who were ice-bound with him during the winter (Vol. 1, page 336). "Very significant in determining the trend of our inmost thoughts were our dreams, which were never more vivid and numerous than just at this time. Even those of

our comrades who ordinarily dreamed but seldom, now had long stories to tell, when in the morning we exchanged our latest experiences in that realm of phantasy. All of them dealt with that outside world that now was so far away from us, but often they fitted into our present condition. Food and drink were most often the pivots about which our dreams revolved. One of us, who excelled in going to great dinners in his sleep, was most happy whenever he could tell us in the morning that he attended a dinner of three courses; another one dreamed of tobacco, whole mountains of tobacco; still another dreamed of a ship that came along on the open sea, under full sail. One other dream deserves mention: The postman comes with the mail and gives a long explanation of why it is so late; he had delivered it to the wrong address and only after great trouble on his part had succeeded in getting it back. Of course one occupies himself with even more impossible things in sleep, but in nearly all the dreams that I myself dreamed or heard tell of, the lack of phantasy was quite striking. It would surely be of great psychological interest if all these dreams were recorded. It is easy to understand how we longed for sleep, since it could offer us everything for which each one of us felt the most burning desire." I quote further from Du Prel. "Mungo Park, who during a trip in Africa was almost exhausted, dreamed without interruption of the fertile valleys and fields of his home. Trenck, tortured by hunger in the redoubt at Magdeburg, likewise saw himself surrounded by wonderful meals, and George Back, who took part in Franklin's first expedition, dreamed regularly and consistently of luxurious meals when, as a result of terrible privations, he was nearly dead of hunger."

A man who feels great thirst at night after enjoying highly seasoned food for supper, often dreams that he is drinking. It is of course impossible to satisfy a rather strong desire for food or drink by means of the dream; from such a dream one awakes thirsty and must now drink real water. The effect of the dream is in this case practically trifling, but it is none the less clear that it was called up for the purpose of maintaining the sleep in spite of the urgent impulse to awake and to act. Dreams of satisfaction often overcome needs of a lesser intensity.

In a like manner, under the influence of sexual stimuli, the dream brings about satisfaction that shows noteworthy peculiarities. As a result of the characteristic of the sexual urge which makes it somewhat less dependent upon its object than hunger and thirst, satisfaction in a dream of

pollution may be an actual one, and as a result of difficulties to be mentioned later in connection with the object, it happens especially often that the actual satisfaction is connected with confused or distorted dream content. This peculiarity of the dream of pollution, as O. Rank has observed, makes it a fruitful subject to pursue in the study of dream distortion. Moreover, all dreams of desire of adults usually contain something besides satisfaction, something that has its origin in the sources of the purely psychic stimuli, and which requires interpretation to render it intelligible.

Moreover we shall not maintain that the wish-fulfillment dreams of the infantile kind occur in adults only as reactions to the known imperative desires. We also know of short clear dreams of this sort under the influence of dominating situations that arise from unquestionably psychic sources. As, for example, in dreams of impatience, whenever a person has made preparations for a journey, for a theatrical performance, for a lecture or for a visit, and now dreams of the anticipated fulfillment of his expectations, and so arrives at his goal the night before the actual experience, in the theatre or in conversation with his host. Or the well-named dreams of comfort, when a person who likes to prolong his sleep, dreams that he is already up, is washing himself, or is already in school, while as a matter of fact he continues sleeping, hence would rather get up in a dream than in reality. The desire for sleep which we have recognized as a regular part of the dream structure becomes intense in these dreams and appears in them as the actual shaping force of the dream. The wish for sleep properly takes its place beside other great physical desires.

At this point I refer you to a picture by Schwind, from the Schack Gallery in Munich, so that you may see how rightly the artist has conceived the origin of a dream from a dominating situation. It is the *Dream of a Prisoner,* which can have no other subject than his release. It is a very neat stroke that the release should be effected through the window, for the ray of light that awakens the prisoner comes through the same window. The gnomes standing one above the other probably represent the successive positions which he himself had to take in climbing to the height of the window, and I do not think I am mistaken or that I attribute too much preconcerted design to the artist, by noting that the uppermost of the gnomes, who is filing the grating (and so does what the prisoner would like to do) has the features of the prisoner.

In all other dreams except those of children and those of the infantile type, distortion, as we have said, blocks our way. At the outset we cannot ascertain whether they are also wish fulfillments, as we suspect; from their manifest content we cannot determine from what psychic stimulus they derive their origin, and we cannot prove that they also are occupied in doing away with the stimulus and in satisfying it. They must probably be interpreted, that is, translated; their distortion must be annulled; their manifest content replaced by their latent thought before we can judge whether what we have found in children’s dreams may claim a universal application for all dreams.

NINTH LECTURE. THE DREAM

The Dream Censor

WE have learned to know the origin, nature and function of the dream from the study of children's dreams. *Dreams are the removal of sleep-disturbing psychic stimuli by way of hallucinated satisfaction.* Of adults' dreams, to be sure, we could explain only one group, what we characterized as dreams of an infantile type. As to the others we know nothing as yet, nor do we understand them. For the present, however, we have obtained a result whose significance we do not wish to underestimate. Every time a dream is completely comprehensible to us, it proves to be an hallucinated wish-fulfillment. This coincidence cannot be accidental, nor is it an unimportant matter.

We conclude, on the basis of various considerations and by analogy to the conception of mistakes, that another type of dream is a distorted substitute for an unknown content and that it must first be led back to that content. Our next task is the investigation and the understanding of this dream distortion.

Dream distortion is the thing which makes the dream seem strange and incomprehensible to us. We want to know several things about it; firstly, whence it comes, its dynamics; secondly, what it does; and finally, how it does it. We can say at this point that dream distortion is the product of the dream work, that is, of the mental functioning of which the dream itself is the conscious symptom. Let us describe the dream work and trace it back to the forces which work upon it.

And now I shall ask you to listen to the following dream. It was recorded by a lady of our profession, and according to her, originated with a highly cultivated and respected lady of advanced age. No analysis of this dream was made. Our informant remarks that to a psychoanalyst it needs no interpretation. The dreamer herself did not interpret it, but she judged and condemned it as if she understood its interpretation. For she said concerning it: "That a woman of fifty should dream such abominable, stupid stuff — a woman who has no other thought, day and night, than to care for her child!"

And now follows the dreams of the "*services of love*." "She goes into Military Hospital No. 1, and says to the sentry at the gate, that she must

speak to the chief physician ... (she mentions a name which is not familiar to her), as she wants to offer her service to the hospital. She stresses the word ‘service,’ so love services. Since she is an old lady he lets her pass after some hesitation. But instead of reaching the chief physician, she finds herself in a large somber room in which there are many officers and army doctors sitting and standing around a long table. She turns with her proposal to a staff doctor who, after a few words, soon understands her. The words of her speech in the dream are, ‘I and numerous other women and girls of Vienna are ready for the soldiers, troops, and officers, without distinction....’ Here in the dream follows a murmuring. That the idea is, however, correctly understood by those present she sees from the semi-embarrassed, somewhat malicious expressions of the officers. The lady then continues, ‘I know that our decision sounds strange, but we are in bitter earnest. The soldier in the field is not asked either whether or not he wants to die.’ A moment of painful silence follows. The staff doctor puts his arm around her waist and says, ‘Madame, let us assume that it really came to that ...’ (murmurs). She withdraws from his arm with the thought, ‘They are all alike!’ and answers, ‘My heavens, I am an old woman, and perhaps will never be confronted with that situation; one consideration, moreover, must be kept in mind: the consideration of age, which prevents an older woman from ... with a very young boy ... (murmurs) ... that would be horrible.’ The staff doctor, ‘I understand perfectly.’ Several officers, among them one who had paid court to her in her youth, laugh loudly, and the lady asks to be conducted to the chief physician, whom she knows, so that everything may be arranged. At this she realizes with great dismay that she does not know his name. The staff officer, nevertheless, very politely and respectfully shows her the way to the second story, up a very narrow winding iron stairway which leads to the upper story directly from the door of the room. In going up she hears an officer say, ‘That is a tremendous decision irrespective of whether a woman is young or old; all honor to her!’

“With the feeling that she is merely doing her duty, she goes up an endless staircase.”

This dream she repeats twice in the course of a few weeks, with — as the lady notices — quite insignificant and very senseless changes.

This dream corresponds in its structure to a day dream. It has few gaps, and many of its individual points might have been elucidated as to content

through inquiry, which, as you know, was omitted. The conspicuous and interesting point for us, however, is that the dream shows several gaps, gaps not of recollection, but of original content. In three places the content is apparently obliterated, the speeches in which these gaps occur are interrupted by murmurs. Since we have performed no analysis, we have, strictly speaking, also no right to make any assertion about the meaning of the dream. Yet there are intimations given from which something may be concluded. For example, the phrase “services of love,” and above all the bits of speech which immediately precede the murmurs, demand a completion which can have but one meaning. If we interpolate these, then the phantasy yields as its content the idea that the dreamer is ready, as an act of patriotic duty, to offer her person for the satisfaction of the erotic desires of the army, officers as well as troops. That certainly is exceedingly shocking, it is an impudent libidinous phantasy, but — it does not occur in the dream at all. Just at the point where consistency would demand this confession, there is a vague murmur in the manifest dream, something is lost or suppressed.

I hope you will recognize the inevitability of the conclusion that it is the shocking character of these places in the dream that was the motive for their suppression. Yet where do you find a parallel for this state of affairs? In these times you need not seek far. Take up any political paper and you will find that the text is obliterated here and there, and that in its place shimmers the white of the paper. You know that that is the work of the newspaper censor. In these blank spaces something was printed which was not to the liking of the censorship authorities, and for that reason it was crossed out. You think that it is a pity, that it probably was the most interesting part, it was “the best part.”

In other places the censorship did not touch the completed sentence. The author foresaw what parts might be expected to meet with the objection of the censor, and for that reason he softened them by way of prevention, modified them slightly, or contented himself with innuendo and allusion to what really wanted to flow from his pen. Thus the sheet, it is true, has no blank spaces, but from certain circumlocutions and obscurities of expression you will be able to guess that thoughts of the censorship were the restraining motive.

Now let us keep to this parallel. We say that the omitted dream speeches, which were disguised by a murmuring, were also sacrifices to a

censorship. We actually speak of a *dream censor* to which we may ascribe a contributing part in the dream distortion. Wherever there are gaps in the manifest dream, it is the fault of the dream censor. Indeed, we should go further, and recognize each time as a manifestation of the dream censor, those places at which a dream element is especially faint, indefinitely and doubtfully recalled among other, more clearly delineated portions. But it is only rarely that this censorship manifests itself so undisguisedly, so naively one may say, as in the example of the dream of the "services of love." Far more frequently the censorship manifests itself according to the second type, through the production of weakenings, innuendoes, allusions instead of direct truthfulness.

For a third type of dream censorship I know of no parallel in the practice of newspaper censorship, yet it is just this type that I can demonstrate by the only dream example which we have so far analyzed. You will remember the dream of the "three bad theatre tickets for one florin and a half." In the latent thoughts of this dream, the element "*precipitately, too soon*," stood in the foreground. It means: "It was foolish to marry so *early*, it was also foolish to buy theatre tickets so *early*, it was ridiculous of the sister-in-law to spend her money so *hastily*, merely to buy an ornament." Nothing of this central element of the dream thought was evident in the manifest dream. In the latter, going to the theatre and getting the tickets were shoved into the foreground. Through this displacement of the emphasis, this regrouping of the elements of the content, the manifest dream becomes so dissimilar from the latent dream thoughts that no one would suspect the latter behind the former. This displacement of emphasis is a favorite device of the dream distortion and gives the dream that strangeness which makes the dreamer himself unwilling to recognize it as his own production.

Omission, modification, regrouping of the material, these, then, are the effects of the dream censor and the devices of dream distortion. The dream censorship itself is the author, or one of the authors, of the dream distortion whose investigation now occupies us. Modification and rearrangement we are already accustomed to summarize as *displacement*.

After these remarks concerning the effects of the dream censor, let us now turn to their dynamics. I hope you will not consider the expression too anthropomorphically, and picture the dream censor as a severe little manikin who lives in a little brain chamber and there performs his duties;

nor should you attempt to localize him too much, to think of a brain center from which his censoring influence emanates, and which would cease with the injury or extirpation of this center. For the present, the term “dream censor” is no more than a very convenient phrase for a dynamic relationship. This phrase does not prevent us from asking by what tendencies such influence is exerted and upon which tendencies it works; nor will we be surprised to discover that we have already encountered the dream censor before, perhaps without recognizing him.

For such was actually the case. You will remember that we had a surprising experience when we began to apply our technique of free association. We then began to feel that some sort of a resistance blocked our efforts to proceed from the dream element to the unconscious element for which the former is the substitute. This resistance, we said, may be of varying strength, enormous at one time, quite negligible at another. In the latter case we need cross only a few intermediate steps in our work of interpretation. But when the resistance is strong, then we must go through a long chain of associations, are taken far afield and must overcome all the difficulties which present themselves as critical objections to the association technique. What we met with in the work of interpretation, we must now bring into the dream work as the dream censor. The resistance to interpretation is nothing but the objectivation of the dream censor. The latter proves to us that the force of the censor has not spent itself in causing the dream distortion, has not since been extinguished, but that this censorship continues as a permanent institution with the purpose of preserving the distortion. Moreover, just as in the interpretation the strength of the resistance varied with each element, so also the distortion produced by the censor in the same dream is of varying magnitude for each element. If one compares the manifest with the latent dream one sees that certain isolated latent elements have been practically eliminated, others more or less modified, and still others left unchanged, indeed, have perhaps been taken over into the dream content with additional strength.

But we wanted to discover what purposes the censorship serves and against which tendencies it acts. This question, which is fundamental to the understanding of the dream, indeed perhaps to human life, is easily answered if we look over a series of those dreams which have been analyzed. The tendencies which the censorship exercises are those which are recognized by the waking judgment of the dreamer, those with which

he feels himself in harmony. You may rest assured that when you reject an accurate interpretation of a dream of your own, you do so with the same motives with which the dream censor works, the motives with which it produces the dream distortion and makes the interpretation necessary. Recall the dream of our fifty-year old lady. Without having interpreted it, she considers her dream abominable, would have been still more outraged if our informant had told her anything about the indubitable meaning; and it is just on account of this condemnation that the shocking spots in her dream were replaced by a murmur.

The tendencies, however, against which the dream censor directs itself, must now be described from the standpoint of this instance. One can say only that these tendencies are of an objectionable nature throughout, that they are shocking from an ethical, aesthetic and social point of view, that they are things one does not dare even to think, or thinks of only with abhorrence. These censored wishes which have attained to a distorted expression in the dream, are above all expressions of a boundless, reckless egoism. And indeed, the personal ego occurs in every dream to play the major part in each of them, even if it can successfully disguise itself in the manifest content. This *sacro egoismo* of the dream is surely not unconnected with the sleep-inducing cessation of psychic activity which consists, it should be noted, in the withdrawal of interest from the entire external world.

The ego which has been freed of all ethical restraints feels itself in accord with all the demands of the sexual striving, with those demands which have long since been condemned by our aesthetic rearing, demands of such a character that they resist all our moral demands for restraint. The pleasure-striving — the libido, as we term it — chooses its objects without inhibitions, and indeed, prefers those that are forbidden. It chooses not only the wife of another, but, above all, those incestuous objects declared sacred by the agreement of mankind — the mother and sister in the man’s case, the father and brother in the woman’s. Even the dream of our fifty-year old lady is an incestuous one, its libido unmistakably directed toward her son. Desires which we believe to be far from human nature show themselves strong enough to arouse dreams. Hate, too, expends itself without restraint. Revenge and murderous wishes toward those standing closest to the dreamer are not unusual, toward those best beloved in daily life, toward parents, brothers and sisters, toward one’s spouse and one’s

own children. These censored wishes seem to arise from a veritable hell; no censorship seems too harsh to be applied against their waking interpretation.

But do not reproach the dream itself for this evil content. You will not, I am sure, forget that the dream is charged with the harmless, indeed the useful function of guarding sleep from disturbance. This evil content, then, does not lie in the nature of the dream. You know also that there are dreams which can be recognized as the satisfaction of justified wishes and urgent bodily needs. These, to be sure, undergo no dream distortion. They need none. They can satisfy their function without offending the ethical and aesthetic tendencies of the ego. And will you also keep in mind the fact that the amount of dream distortion is proportional to two factors. On the one hand, the worse the censorable wish, the greater the distortion; on the other hand, however, the stricter the censor himself is at any particular time the greater the distortion will be also. A young, strictly reared and prudish girl will, by reason of those factors, disfigure with an inexorable censorship those dream impulses which we physicians, for example, and which the dreamer herself ten years later, would recognize as permissible, harmless, libidinous desires.

Besides, we are far from being at the point where we can allow ourselves to be shocked by the results of our work of interpretation. I think we are not yet quite adept at it; and above all there lies upon us the obligation to secure it against certain attacks. It is not at all difficult to “find a hitch” in it. Our dream interpretations were made on the hypotheses we accepted a little while ago, that the dream has some meaning, that from the hypnotic to the normal sleep one may carry over the idea of the existence at such times of an unconscious psychic activity, and that all associations are predetermined. If we had come to plausible results on the basis of these hypotheses, we would have been justified in concluding that the hypotheses were correct. But what is to be done when the results are what I have just pictured them to be? Then it surely is natural to say, “These results are impossible, foolish, at least very improbable, hence there must have been something wrong with the hypotheses. Either the dream is no psychic phenomenon after all, or there is no such thing as unconscious mental activity in the normal condition, or our technique has a gap in it somewhere. Is that not a simpler and more

satisfying conclusion than the abominations which we pretend to have disclosed on the basis of our suppositions?”

Both, I answer. It is a simpler as well as a more satisfying conclusion, but not necessarily more correct for that reason. Let us take our time, the matter is not yet ripe for judgment. Above all we can strengthen the criticism against our dream interpretation still further. That its conclusions are so unpleasant and unpalatable is perhaps of secondary importance. A stronger argument is the fact that the dreamers to whom we ascribe such wish-tendencies from the interpretation of their dreams reject the interpretations most emphatically, and with good reason. “What,” says the one, “you want to prove to me by this dream that I begrudged the sums which I spent for my sister’s trousseau and my brother’s education? But indeed that can’t be so. Why I work only for my sister, I have no interest in life but to fulfill my duties toward her, as being the oldest child, I promised our blessed mother I would.” Or a woman says of her dream, “You mean to say that I wish my husband were dead! Why, that is simply revolting, nonsense. It isn’t only that we have the happiest possible married life, you probably won’t believe me when I tell you so, but his death would deprive me of everything else that I own in the world.” Or another will tell us, “You mean that I have sensual desires toward my sister? That is ridiculous. I am not in the least fond of her. We don’t get along and I haven’t exchanged a word with her in years.” We might perhaps ignore this sort of thing if the dreamers did not confirm or deny the tendencies ascribed to them; we could say that they are matters which the dreamers do not know about themselves. But that the dreamers should feel the exact opposite of the ascribed wish, and should be able to prove to us the dominance of the opposite tendency — this fact must finally disconcert us. Is it not time to lay aside the whole work of the dream interpretation as something whose results reduce it to absurdity?

By no means; this stronger argument breaks down when we attack it critically. Assuming that there are unconscious tendencies in the psychic life, nothing is proved by the ability of the subject to show that their opposites dominate his conscious life. Perhaps there is room in the psychic life even for antithetical tendencies, for contradictions which exist side by side, yes, possibly it is just the dominance of the one impulse which is the necessary condition for the unconsciousness of its opposite. The first two objections raised against our work hold merely that the results of dream

interpretation are not simple, and very unpleasant. In answer to the first of these, one may say that for all your enthusiasm for the simple solution, you cannot thereby solve a single dream problem. To do so you must make up your mind to accept the fact of complicated relationships. And to the second of these objections one may say that you are obviously wrong to use a preference or a dislike as the basis for a scientific judgment. What difference does it make if the results of the dream interpretation seem unpleasant, even embarrassing and disgusting to you? “That doesn’t prevent them from existing,” as I used to hear my teacher Charcot say in similar cases, when I was a young doctor. One must be humble, one must keep personal preferences and antipathies in the background, if one wishes to discover the realities of the world. If a physicist can prove to you that the organic life of this planet must, within a short period of time, become completely extinct, do you also venture to say to him, “That cannot be so. This prospect is too unpleasant.” On the contrary, you will be silent until another physicist proves some error in the assumptions or calculations of the first. If you reject the unpleasant, you are repeating the mechanism of dream construction instead of understanding and mastering it.

Perhaps you will promise to overlook the repulsive character of the censored dream-wishes, and will take refuge in the argument that it is improbable, after all, that so wide a field be given over to the evil in the constitution of man. But does your own experience justify you in saying that? I will not discuss the question of how you may estimate yourselves, but have you found so much good will among your superiors and rivals, so much chivalry among your enemies, so little envy in their company, that you feel yourselves in duty bound to enter a protest against the part played by the evil of egoism in human nature? Are you ignorant of how uncontrolled and undependable the average human being is in all the affairs of sex life? Or do you not know that all the immoralities and excesses of which we dream nightly are crimes committed daily by waking persons? What else does psychoanalysis do here but confirm the old saying of Plato, that the good people are those who content themselves with dreaming what the others, the bad people, really do?

And now turn your attention from the individual case to the great war devastating Europe. Think of the amount of brutality, the cruelty and the lies allowed to spread over the civilized world. Do you really believe that a handful of conscienceless egoists and corruptionists could have

succeeded in setting free all these evil spirits, if the millions of followers did not share in the guilt? Do you dare under these circumstances to break a lance for the absence of evil from the psychic constitution of mankind?

You will reproach me with judging the war one-sidedly, you will say that it has also brought forth all that is most beautiful and noble in mankind, its heroic courage, its self-sacrifice, its social feeling. Certainly, but do not at this point allow yourselves to become guilty of the injustice which has so often been perpetrated against psychoanalysis, of reproaching it with denying one thing because it was asserting another. It is not our intention to deny the noble strivings of human nature, nor have we ever done anything to deprecate their value. On the contrary, I show you not only the censored evil dream-wishes, but also the censor which suppresses them and renders them unrecognizable. We dwell on the evil in mankind with greater emphasis only because others deny it, a method whereby the psychic life of mankind does not become better, but merely incomprehensible. When, however, we give up this one-sided ethical estimate, we shall surely be able to find a more accurate formula for the relationship of the evil to the good in human nature.

And thus the matter stands. We need not give up the conclusions to which our labors in dream interpretation lead us even though we must consider those conclusions strange. Perhaps we can approach their understanding later by another path. For the present, let us repeat: dream distortion is a consequence of the censorship practised by accredited tendencies of the ego against those wish-impulses that are in any way shocking, impulses which stir in us nightly during sleep. Why these wish-impulses come just at night, and whence they come — these are questions which will bear considerable investigation.

It would be a mistake, however, to omit to mention, with fitting emphasis, another result of these investigations. The dream wishes which try to disturb our sleep are not known to us, in fact we learn of them first through the dream interpretation. Therefore, they may be described as “at that time” unconscious in the sense above defined. But we can go beyond this and say that they are more than merely “at that time” unconscious. The dreamer to be sure denies their validity, as we have seen in so many cases, even after he has learned of their existence by means of the interpretation. The situation is then repeated which we first encountered in the interpretation of the tongue slip “hiccough” where the toastmaster was

outraged and assured us that neither then nor ever before had he been conscious of disrespectful impulse toward his chief. This is repeated with every interpretation of a markedly distorted dream, and for that reason attains a significance for our conception. We are now prepared to conclude that there are processes and tendencies in the psychic life of which one knows nothing at all, has known nothing for some time, might, in fact, perhaps never have known anything. The unconscious thus receives a new meaning for us; the idea of “at present” or “at a specific time” disappears from its conception, for it can also mean *permanently* unconscious, not merely *latent at the time*. Obviously we shall have to learn more of this at another session.

TENTH LECTURE. THE DREAM

Symbolism in the Dream

WE have discovered that the distortion of dreams, a disturbing element in our work of understanding them, is the result of a censorious activity which is directed against the unacceptable of the unconscious wish-impulses. But, of course, we have not maintained that censorship is the only factor which is to blame for the dream distortion, and we may actually make the discovery in a further study of the dream that other items play a part in this result. That is, even if the dream censorship were eliminated we might not be in a position to understand the dreams; the actual dream still might not be identical with the latent dream thought.

This other item which makes the dream unintelligible, this new addition to dream distortion, we discover by considering a gap in our technique. I have already admitted that for certain elements of the dream, no associations really occur to the person being analyzed. This does not happen so often as the dreamers maintain; in many cases the association can be forced by persistence. But still there are certain instances in which no association is forthcoming, or if forced does not furnish what we expected. When this happens in the course of a psychoanalytic treatment, then a particular meaning may be attached thereto, with which we have nothing to do here. It also occurs, however, in the interpretation of the dreams of a normal person or in interpreting one's own dreams. Once a person is convinced that in these cases no amount of forcing of associations will avail, he will finally make the discovery that the unwished-for contingency occurs regularly in certain dream elements, and he will begin to recognize a new order of things there, where at first he believed he had come across a peculiar exception to our technique.

In this way we are tempted to interpret these silent dream elements ourselves, to undertake their translation by the means at hand. The fact that every time we trust to this substitution we obtain a satisfactory meaning is forced upon us; until we resolve upon this decision the dream remains meaningless, its continuity is broken. The accumulation of many similar cases tends to give the necessary certainty to our first timid attempts.

I am expounding all this in rather a schematic manner, but this is permissible for purposes of instruction, and I am not trying to misstate, but only to simplify matters.

In this manner we derive constant translations for a whole series of dream elements just as constant translations are found in our popular dream books for all the things we dream. But do not forget that in our association technique we never discover constant substitutes for the dream elements.

You will say at once that this road to interpretation appears far more uncertain and open to objection than the former methods of free association. But a further fact is to be taken into consideration. After one has gathered a sufficient number of such constant substitutes empirically, he will say that of his own knowledge he should actually have denied that these items of dream interpretation could really be understood without the associations of the dreamer. The facts that force us to recognize their meaning will appear in the second half of our analysis.

We call such a constant relationship between a dream element and its interpretation *symbolic*. The dream element is itself a *symbol* of the unconscious dream thought. You will remember that previously, when we were investigating the relationship between dream elements and their actuality, I drew three distinctions, viz., that of the part of the whole, that of the allusion, and that of the imagery. I then announced that there was a fourth, but did not name it. This fourth is the symbolic relationship here introduced. Very interesting discussions center about this, and we will now consider them before we express our own particular observations on symbolism. Symbolism is perhaps the most noteworthy chapter of dream study.

In the first place, since symbols are permanent or constant translations, they realize, in a certain measure, the ideal of ancient as well as popular dream interpretation, an ideal which by means of our technique we had left behind. They permit us in certain cases to interpret a dream without questioning the dreamer who, aside from this, has no explanation for the symbol. If the interpreter is acquainted with the customary dream symbols and, in addition, with the dreamer himself, the conditions under which the latter lives and the impressions he received before having the dream, it is often possible to interpret a dream without further information — to translate it “right off the bat.” Such a trick flatters the interpreter and

impresses the dreamer; it stands out as a pleasurable incident in the usual arduous course of cross-examining the dreamer. But do not be misled. It is not our function to perform tricks. Interpretation based on a knowledge of symbols is not a technique that can replace the associative technique, or even compare with it. It is a supplement to the associative technique, and furnishes the latter merely with transplanted, usable results. But as regards familiarity with the dreamer's psychic situation, you must consider the fact that you are not limited to interpreting the dreams of acquaintances; that as a rule you are not acquainted with the daily occurrences which act as the stimuli for the dreams, and that the associations of the subject furnish you with a knowledge of that very thing we call the psychic situation.

Furthermore, it is very extraordinary, particularly in view of circumstances to be mentioned later, that the most vehement opposition has been voiced against the existence of the symbolic relationship between the dream and the unconscious. Even persons of judgment and position, who have otherwise made great progress in psychoanalysis, have discontinued their support at this point. This is the more remarkable since, in the first place, symbolism is neither peculiar to the dream nor characteristic of it, and since in the second place, symbolism in the dream was not discovered through psychoanalysis, although the latter is not poor otherwise in making startling discoveries. The discoverer of dream symbolism, if we insist on a discovery in modern times, was the philosopher K. A. Scherner (1861). Psychoanalysis affirmed Scherner's discovery and modified it considerably.

Now you will want to know something of the nature of dream symbolism, and to hear some examples. I shall gladly impart to you what I know, but I admit that our knowledge is not so complete as we could desire it to be.

The nature of the symbol relationship is a comparison, but not any desired comparison. One suspects a special prerequisite for this comparison, but is unable to say what it is. Not everything to which we are able to compare an object or an occurrence occurs in the dream as its symbol; on the other hand, the dream does not symbolize anything we may choose, but only specific elements of the dream thought. There are limitations on both sides. It must be admitted that the idea of the symbol cannot be sharply delimited at all times — it mingles with the

substitution, dramatization, etc., even approaches the allusion. In one series of symbols the basic comparison is apparent to the senses. On the other hand, there are other symbols which raise the question of where the similarity, the “something intermediate” of this suspected comparison is to be sought. We may discover it by more careful consideration, or it may remain hidden to us. Furthermore, it is extraordinary, if the symbol is a comparison, that this comparison is not revealed by the association, that the dreamer is not acquainted with the comparison, that he makes use of it without knowing of its existence. Indeed, the dreamer does not even care to admit the validity of this comparison when it is pointed out to him. So you see, a symbolic relationship is a comparison of a very special kind, the origin of which is not yet clearly understood by us. Perhaps later we may find references to this unknown factor.

The number of things that find symbolic representation in the dream is not great — the human body as a whole, parents, children, brothers and sisters, birth, death, nakedness and a few others. The only typical, that is, regular representation of the human person as a whole is in the form of a *house*, as was recognized by Scherner who, indeed, wished to credit this symbol with an overwhelming significance which it does not deserve. It occurs in dreams that a person, now lustful, now frightened, climbs down the fronts of houses. Those with entirely smooth walls are men; but those which are provided with projections and balconies to which one can hold on, are women. Parents appear in the dream as *king* and *queen*, or other persons highly respected. The dream in this instance is very pious. It treats children, and brothers and sisters, less tenderly; they are symbolized as *little animals* or *vermin*. Birth is almost regularly represented by some reference to *water*; either one plunges into the water or climbs out of it, or rescues someone from the water, or is himself rescued from it, i.e., there is a mother-relation to the person. Death is replaced in the dream by *taking a journey, riding in a train*; *being dead, by various darksome, timid suggestions*; *nakedness, by clothes* and *uniforms*. You see here how the lines between symbolic and suggestive representation merge one into another.

In contrast to the paucity of this enumeration, it is a striking fact that the objects and subject matter of another sphere are represented by an extraordinarily rich symbolism. This is the sphere of the sexual life, the genitals, the sex processes and sexual intercourse. The great majority of

symbols in the dream are sex symbols. A remarkable disproportion results from this fact. The designated subject matters are few, their symbols extraordinarily profuse, so that each of these objects can be expressed by any number of symbols of almost equal value. In the interpretation something is disclosed that arouses universal objection. The symbol interpretations, in contrast to the many-sidedness of the dream representations, are very monotonous — this displeases all who deal with them; but what is one to do?

Since this is the first time in these lectures that we speak of the sexual life, I must tell you the manner in which I intend to handle this theme. Psychoanalysis sees no reason for hiding matters or treating them by innuendo, finds no necessity of being ashamed of dealing with this important subject, believes it is proper and decent to call everything by its correct name, and hopes most effectively in this manner to ward off disturbing or salacious thoughts. The fact that I am talking before a mixed audience can make no difference on this point. Just as there is no special knowledge either for the Delphic oracle or for flappers, so the ladies present among you have, by their appearance in this lecture hall, made it clear that they wish to be considered on the same basis as the men.

The dream has a number of representations for the male genital that may be called symbolic, and in which the similarity of the comparison is, for the most part, very enlightening. In the first place, the holy figure 3 is a symbolical substitute for the entire male genital. The more conspicuous and more interesting part of the genital to both sexes, the male organ, has symbolical substitute in objects of like form, those which are long and upright, such as *sticks*, *umbrellas*, *poles*, *trees*, etc. It is also symbolized by objects that have the characteristic, in common with it, of penetration into the body and consequent injury, hence pointed *weapons* of every type, *knives*, *daggers*, *lances*, *swords*, and in the same manner *firearms*, *guns*, *pistols* and the *revolver*, which is so suitable because of its shape. In the troubled dream of the young girl, pursuit by a man with a knife or a firearm plays a big role. This, probably the most frequent dream symbolism, is easily translatable. Easily comprehensible, too, is the substitution for the male member of objects out of which water flows: *faucets*, *water cans*, *fountains*, as well as its representation by other objects that have the power of elongation, such as *hanging lamps*, *collapsible pencils*, etc. That *pencils*, *quills*, *nail files*, *hammers* and other

instruments are undoubtedly male symbols is a fact connected with a conception of the organ, which likewise is not far to seek.

The extraordinary characteristic of the member of being able to raise itself against the force of gravity, one of the phenomena of erection, leads to symbolic representations by *balloons*, *aeroplanes*, and more recently, *Zeppelins*. The dream has another far more expressive way of symbolizing erection. It makes the sex organ the essential part of the whole person and pictures the person himself as *flying*. Do not feel disturbed because the dreams of flying, often so beautiful, and which we all have had, must be interpreted as dreams of general sexual excitement, as erection dreams. P. Federn, among the psychoanalytical students, has confirmed this interpretation beyond any doubt, and even Mourly Vold, much praised for his sobriety, who carried on his dream experiments with artificial positions of the arms and legs, and who was really opposed to psychoanalysis — perhaps knew nothing about psychoanalysis — has come to the same conclusion as a result of his research. It is no objection to this conclusion that women may have the same dreams of flying. Remember that our dreams act as wish-fulfillments, and that the wish to be a man is often present in women, consciously or unconsciously. And the fact that it is possible for a woman to realize this wish by the same sensation as a man does, will not mislead anyone acquainted with anatomy. There is a small organ in the genitals of a woman similar to that of the male, and this small organ, the clitoris, even in childhood, and in the years before sexual intercourse, plays the same role as does the large organ of the male.

To the less comprehensible male sex-symbols belong certain *reptiles* and *fish*, notably the famous symbol of the *snake*. Why *hats* and *cloaks* should have been turned to the same use is certainly difficult to discover, but their symbolic meaning leaves no room for doubt. And finally the question may be raised whether possibly the substitution of some other member as a representation for the male organ may not be regarded as symbolic. I believe that one is forced to this conclusion by the context and by the female counterparts.

The female genital is symbolically represented by all those objects which share its peculiarity of enclosing a space capable of being filled by something — viz., by *pits*, *caves*, and *hollows*, by *pitchers* and *bottles*, by *boxes* and *trunks*, *jars*, *cases*, *pockets*, etc. The *ship*, too, belongs in this category. Many symbols represent the womb of the mother rather than the

female genital, as *wardrobes*, *stoves*, and primarily a *room*. The room-symbolism is related to the house-symbol, *doors* and *entrances* again become symbolic of the genital opening. But materials, too, are symbols of the woman — *wood*, *paper*, and objects that are made of these materials, such as *tables* and *books*. Of animals, at least the *snail* and *mussel* are unmistakably recognizable as symbols for the female; of parts of the body the *mouth* takes the place of the genital opening, while *churches* and *chapels* are structural symbolisms. As you see, all of these symbols are not equally comprehensible.

The breasts must be included in the genitals, and like the larger hemispheres of the female body are represented by *apples*, *peaches* and *fruits* in general. The pubic hair growth of both sexes appears in the dream as *woods* and *bushes*. The complicated topography of the female genitals accounts for the fact that they are often represented as scenes with *cliffs*, *woods* and *water*, while the imposing mechanism of the male sex apparatus leads to the use of all manner of very complicated *machinery*, difficult to describe.

A noteworthy symbol of the female genital is also the *jewel-casket*; *jewels* and *treasure* are also representatives of the beloved person in the dream; *sweets* frequently occur as representatives of sexual delights. The satisfaction in one's own genital is suggested by all types of *play*, in which may be included *piano-playing*. Exquisite symbolic representations of *onanism* are *sliding* and *coasting* as well as *tearing off a branch*. A particularly remarkable dream symbol is that of having *one's teeth fall out*, or *having them pulled*. Certainly its most immediate interpretation is castration as a punishment for onanism. Special representations for the relations of the sexes are less numerous in the dream than we might have expected from the foregoing. Rhythmic activities, such as *dancing*, *riding* and *climbing* may be mentioned, also harrowing experiences, such as *being run over*. One may include certain *manual activities*, and, of course, *being threatened with weapons*.

You must not imagine that either the use or the translation of these symbols is entirely simple. All manner of unexpected things are continually happening. For example, it seems hardly believable that in these symbolic representations the sex differences are not always sharply distinguished. Many symbols represent a genital in general, regardless of whether male or female, e.g., the *little child*, the *small son* or *daughter*. It

sometimes occurs that a predominantly male symbol is used for a female genital, or vice versa. This is not understood until one has acquired an insight into the development of the sexual representations of mankind. In many instances this double meaning of symbols may be only apparent; the most striking of the symbols, such as *weapons*, *pockets* and *boxes* are excluded from this bisexual usage.

I should now like to give a summary, from the point of view of the symbols rather than of the thing represented, of the field out of which the sex symbols are for the most part taken, and then to make a few remarks about the symbols which have points in common that are not understood. An obscure symbol of this type is the *hat*, perhaps headdress on the whole, and is usually employed as a male representation, though at times as a female. In the same way the *cloak* represents a man, perhaps not always the genital aspect. You are at liberty to ask, why? The *cravat*, which is suspended and is not worn by women, is an unmistakable male symbol. *White laundry*, all *linen*, in fact, is female. *Dresses*, *uniforms* are, as we have already seen, substitutes for nakedness, for body-formation; the *shoe* or *slipper* is a female genital. *Tables* and *wood* have already been mentioned as puzzling but undoubtedly female symbols. *Ladders*, *ascents*, *steps* in relation to their mounting, are certainly symbols of sexual intercourse. On closer consideration we see that they have the rhythm of walking as a common characteristic; perhaps, too, the heightening of excitement and the shortening of the breath, the higher one mounts.

We have already spoken of *natural scenery* as a representation of the female genitals. *Mountains* and *cliffs* are symbols of the male organ; the *garden* a frequent symbol of the female genitals. *Fruit* does not stand for the child, but for the breasts. *Wild animals* signify sensually aroused persons, or further, base impulses, passions. *Blossoms* and *flowers* represent the female genitals, or more particularly, virginity. Do not forget that the blossoms are really the genitals of the plants.

We already know the *room* as a symbol. The representation may be extended in that the windows, entrances and exits of the room take on the meaning of the body openings. Whether the room is *open* or *closed* is a part of this symbolism, and the *key* that opens it is an unmistakable male symbol.

This is the material of dream symbolism. It is not complete and might be deepened as well as extended. But I am of the opinion it will seem more

than enough to you, perhaps will make you reluctant. You will ask, “Do I really live in the midst of sex symbols? Are all the objects that surround me, all the clothes I put on, all the things that I touch, always sex symbols, and nothing else?” There really are sufficient grounds for such questions, and the first is, “Where, in fact, are we to find the meaning of these dream symbols if the dreamer himself can give no information concerning them, or at best can give only incomplete information?”

My answer is: “From many widely different sources, from fairy tales and myths, jokes and farces, from folklore, that is, the knowledge of the customs, usages, sayings and songs of peoples, from the poetic and vulgar language. Everywhere we find the same symbolism and in many of these instances we understand them without further information. If we follow up each of these sources separately we shall find so many parallels to the dream symbolism that we must believe in the correctness of our interpretations.”

The human body, we have said, is, according to Scherner, frequently symbolized in the dream by the house. Continuing this representation, the windows, doors and entrances are the entrances into the body cavities, the facades are smooth or provided with balconies and projections to which to hold. The same symbolism is to be found in our daily speech when we greet a good friend as “*old house*” or when we say of someone, “We’ll hit him in the *belfry*,” or maintain of another that he’s not quite right in the *upper story*. In anatomy the body openings are sometimes called the *body-portals*.

The fact that we meet our parents in the dream as imperial or royal persons is at first surprising. But it has its parallel in the fairy tale. Doesn’t it begin to dawn upon us that the many fairy tales which begin “Once upon a time there was a *king* and a *queen*” intend nothing else than, “Once there was a *father* and a *mother*?” In our families we refer to our children as *princes*, the eldest as the *crown-prince*. The king usually calls himself the *father of the country*. We playfully designate little children as *worms*, and say, sympathetically, “*poor little worm.*”

Let us return to the symbolism of the house. When we use the projections of the house to hold ourselves on to in the dream, are we not reminded of the familiar colloquialism about persons with well-developed breasts: “She has something to *hold onto*”? The folk express this in still another way when it says, “there’s lots of *wood in front of her house*”; as

though it wished to come to the aid of our interpretation that wood is a feminine, maternal symbol.

In addition to wood there are others. We might not understand how this material has come to be a substitute for the maternal, the feminine. Here our comparison of languages may be helpful. The German word *Holz* (wood) is said to be from the same stem as the Greek word, νλη, which means stuff, raw material. This is an example of the case, not entirely unusual, where a general word for material finally is exclusively used for some special material. There is an island in the ocean, known by the name of Madeira. The Portuguese gave it this name at the time of its discovery because it was at that time entirely covered with forests, for in the language of the Portuguese, Madeira means *wood*. You will recognize, however, that Madeira, is nothing else than the slightly changed Latin word *materia* which again has the general meaning of *material* Material is derived from *mater,* mother. The material out of which something is made, is at the same time its mother-part. In the symbolic use of wood for woman, mother, this ancient conception still lives.

Birth is regularly expressed in dreams by some connection with water; one plunges into the water, or comes out of the water, which means one gives birth to, or is born. Now let us not forget that this symbol may refer in two ways to the truths of evolutionary history. Not alone have all land-mammals, including the ancestors of man, developed out of water animals — this is the ultimate fact — but every single mammal, every human being, lived the first part of his existence in the water — namely, lived in the body of his mother as an embryo in the amniotic fluid and came out of the water at the time of his birth. I do not wish to maintain that the dreamer knows this, on the contrary I hold that he does not have to know. The dreamer very likely knows some things because of the fact that he was told about them in his childhood, and for that very reason I maintain that this knowledge has played no part in the construction of his symbols. He was told in childhood that the stork brought him — but where did it get him? Out of a lake, out of the well — again, out of the water. One of my patients to whom such information had been given, a little count, disappeared for a whole afternoon. Finally he was discovered lying at the edge of the palace lake, his little face bent above the water and earnestly peering into it to see if he could not see the little children at the bottom.

In the myths of the birth of the hero, which O. Rank submitted to comparative examination, — the oldest is that of King Sargon of Agade, about 2800 B.C. — exposure in the water and rescue from water play a predominating role. Rank has recognized that these are representations of birth, analogous to those customary in dreams. When a person in his dream rescues another from the water, the latter becomes his mother, or just plainly mother; in the myth a person who rescues a child out of the water professes herself as the real mother of the child. In a well-known joke the intelligent Jewish boy is asked who was the mother of Moses. He answered without hesitation, the Princess. But no, he is told, she only took him out of the water. "That's what *she says*," is his reply, and thereby he shows that he has found the correct interpretation of the myth.

Leaving on a trip represents death in the dream. Likewise it is the custom in the nursery when a child asks where someone who has died, and whom he misses, may be, to say to him that the absent one has taken a trip. Again I should like to deny the truth of the belief that the dream symbol originates in this evasion used for the benefit of children. The poet makes use of the same symbol when he speaks of the Hereafter as "that undiscovered bourne from which no *traveler* returns." Even in everyday speech it is customary to refer to the last journey. Every person acquainted with ancient rite knows how seriously, for example, the Egyptians considered the portrayal of a journey to the land of the dead. There still exist many copies of the "death book" which was given to the mummy for this journey as a sort of Baedeker. Since the burial places have been separated from the living quarters, the last journey of the dead person has become a reality.

In the same manner the genital symbolism is just as little peculiar to the dream alone. Every one of you has perhaps at some time or other been so unkind as to call some woman an "*old casket*" without perhaps being aware that he was using a genital symbol. In the New Testament one may read "Woman is a weak *vessel*." The Holy Scriptures of the Jews, so nearly poetic in their style, are filled with sex-symbolic expressions which have not always been correctly understood, and the true construction of which, in the *Song of Songs*, for example, has led to many misunderstandings. In the later Hebraic literature the representation of woman as a house, the door taking the place of the sex opening, is very widespread. The man complains, for instance, when he discovers a lack of virginity, that he has

found *the door open*. The symbol of the table for woman is also known to this literature. The woman says of her husband, “I set the table for him, *but he upset it*.” Lame children are supposed to result from the fact that the man has *overturned the table*. I take these examples from a work by L. Levy of Brünn, *The Sexual Symbolism of the Bible and the Talmud*.

That ships, too, represent women in dreams is a belief derived from the etymologists, who maintain “ship” was originally the name of an earthen vessel and is the same word as *Schaff* (to create). The Greek myth of Periander of Corinth and his wife Melissa is proof that the stove or oven is a woman, and a womb. When, according to Herodotus, the tyrant entreated the shade of his beloved wife, whom, however, he had murdered in a fit of jealousy, for some sign of its identity, the deceased identified herself by the reminder that he, *Periander, had thrust his bread into a cold oven*, as a disguise for an occurrence that could have been known to no other person. In the *Anthropophyteia* published by F. S. Krauss, an indispensable source book for everything that has to do with the sex life of nations, we read that in a certain German region it is commonly said of a woman who has just been delivered of a child, “*Her oven has caved in*.” The making of a fire and everything connected therewith is filled through and through with sex symbolism. The flame is always the male genital, the fireplace, the hearth, is the womb of the woman.

If you have often wondered why it is that landscapes are so often used to represent the female genitals in the dream, then let the mythologist teach you the role Mother Earth has played in the symbolisms and cults of ancient times. You may be tempted to say that a room represents a woman in the dream because of the German colloquialism which uses the term *Frauenzimmer* instead of *Frau*, in other words, it substitutes for the human person the idea of that room that is set aside for her exclusive use. In like manner we speak of the *Sublime Porte*, and mean the Sultan and his government; furthermore, the name of the ancient Egyptian ruler, Pharaoh, means nothing other than “great court room.” (In the ancient Orient the court yards between the double gates of the town were the gathering places of the people, in the same manner as the market place was in the classical world.) What I mean is, this derivation is far too superficial. It seems more probable to me that the room, as the space surrounding man, came to be the symbol of woman. We have seen that the house is used in such a representation; from mythology and poetry we may take the *city*, *fortress*,

palace, *citadel*, as further symbols of woman. The question may easily be decided by the dreams of those persons who do not speak German and do not understand it. In the last few years my patients have been predominantly foreign-language speaking, and I think I can recall that in their dreams as well the room represents woman, even where they had no analogous usages in their languages. There are still other signs which show that the symbolization is not limited by the bounds of language, a fact that even the old dream investigator, Schubert (1862) maintained. Since none of my dreamers were totally ignorant of German I must leave this differentiation to those psychoanalysts who can gather examples in other lands where the people speak but one language.

Among the symbol-representations of the male genital there is scarcely one that does not recur in jokes or in vulgar or poetical usage, especially among the old classical poets. Not alone do those symbols commonly met with in dreams appeal here, but also new ones, e.g., the working materials of various performances, foremost of which is the incantation. Furthermore, we approach in the symbolic representation of the male a very extended and much discussed province, which we shall avoid for economic reasons. I should like to make a few remarks, however, about one of the unclassified symbols — the figure 3. Whether or not this figure derives its holiness from its symbolic meaning may remain undecided. But it appears certain that many objects which occur in nature as three-part things derive their use as coats-of-arms and emblems from such symbolic meaning, e.g., the clover, likewise the three-part French lily, (fleur-de-lys), and the extraordinary coats-of-arms of two such widely separated islands as Sicily and the Isle of Man, where the Triskeles (three partly bended knees, emerging from a central point) are merely said to be the portrayal in a different form of the male genitals. Copies of the male member were used in antiquity as the most powerful charms (*Apotropaea*) against evil influences, and this is connected with the fact that the lucky amulets of our own time may one and all be recognized as genital or sex-symbols. Let us study such a collection, worn in the form of little silver pendants: the four-leaf clover, a pig, a mushroom, a horse-shoe, a ladder, a chimney-sweep. The four-leaf clover, it seems, has usurped the place of the three-leaf clover, which is really more suitable as a symbol; the pig is an ancient symbol of fertility; the mushroom is an unquestionable penis symbol — there are mushrooms that derive their systematic names from their

unmistakable similarity to the male member (Phallus impudicus); the horseshoe recalls the contour of the female genital opening; and the chimney sweep who carries a ladder belongs in this company because he carries on that trade with which the sex-intercourse is vulgarly compared (*cf.* the *Anthropophyteia*). We have already become acquainted with his ladder as a sex symbol in the dream; the German usage is helpful here, it shows us how the verb "to mount" is made use of in an exquisite sexual sense. We use the expressions "*to run after women*," which literally translated would be "*to climb after women*," and "*an old climber*." In French, where "*step*" is "*la marche*" we find that the analogous expression for a man about town is "*un vieux marcheur*." It is apparently not unknown in this connection that the sexual intercourse of many of the larger animals requires a mounting, *a climbing upon* the female.

The tearing off of a branch as the symbolic representation of onanism is not alone in keeping with the vulgar representation of the fact of onanism, but has far-reaching mythological parallels. Especially noteworthy, however, is the representation of onanism, or rather the punishment therefor, castration, by the falling out or pulling out of teeth, because there is a parallel in folk-lore which is probably known to the fewest dreamers. It does not seem at all questionable to me that the practice of circumcision common among so many peoples is an equivalent and a substitute for castration. And now we are informed that in Australia certain primitive tribes practice circumcision as a rite of puberty (the ceremony in honor of the boy's coming of age), while others, living quite near, have substituted for this act the striking out of a tooth.

I end my exposition with these examples. They are only examples. We know more about these matters, and you may well imagine how much richer and how much more interesting such a collection would appear if made, not by amateurs like ourselves, but by real experts in mythology, anthropology, philology and folk-lore. We are compelled to draw a few conclusions which cannot be exhaustive, but which give us much food for thought.

In the first place, we are faced by the fact that the dreamer has at his disposal a symbolic means of expression of which he is unconscious while awake, and does not recognize when he sees. That is as remarkable as if you should make the discovery that your chambermaid understands Sanskrit, although you know she was born in a Bohemian village and never

learned the language. It is not easy to harmonize this fact with our psychological views. We can only say that the dreamer's knowledge of symbolism is unconscious, that it is a part of his unconscious mental life. We make no progress with this assumption. Until now it was only necessary to admit of unconscious impulses, those about which one knew nothing, either for a period of time or at all times. But now we deal with something more; indeed, with unknown knowledge, with thought relationships, comparisons between unlike objects which lead to this, that one constant may be substituted for another. These comparisons are not made anew each time, but they lie ready, they are complete for all time. That is to be concluded from the fact of their agreement in different persons, agreement despite differences in language.

But whence comes the knowledge of these symbol-relationships? The usages of language cover only a small part of them. The dreamer is for the most part unacquainted with the numerous parallels from other sources; we ourselves must first laboriously gather them together.

Secondly, these symbolic representations are peculiar neither to the dreamer nor to the dream work by means of which they become expressed. We have learned that mythology and fairy-tales make use of the same symbolism, as well as do the people in their sayings and songs, the ordinary language of every day, and poetic phantasy. The field of symbolism is an extraordinarily large one, and dream symbolism is but a small part thereof. It is not even expedient to approach the whole problem from the dream side. Many of the symbols that are used in other places do not occur in the dream at all, or at best only very seldom. Many of the dream symbols are to be found in other fields only very rarely, as you have seen. One gets the impression that he is here confronted with an ancient but no longer existent method of expression, of which various phases, however, continue in different fields, one here, one there, a third, perhaps in a slightly altered form, in several fields. I am reminded of the phantasy of an interesting mental defective, who had imagined a fundamental language, of which all these symbolic representations were the remains.

Thirdly, you must have noticed that symbolism in these other fields is by no means sex symbolism solely, while in the dream the symbols are used almost entirely to express sexual objects and processes. Nor is this easily explained. Is it possible that symbols originally sexual in their meaning later came to have other uses, and that this was the reason

perhaps for the weakening of the symbolic representation to one of another nature? These questions are admittedly unanswerable if one has dealt only with dream-symbolism. One can only adhere to the supposition that there is an especially intimate connection between true symbols and things sexual.

An important indication of this has been given us recently. A philologist, H. Sperber (Upsala) who works independently of psychoanalysis, advanced the theory that sexual needs have played the largest part in the origin and development of languages. The first sounds served as means of communication, and called the sexual partner; the further development of the roots of speech accompanied the performance of the primitive man's work. This work was communal and progressed to the accompaniment of rhythmically repeated word sounds. In that way a sexual interest was transferred to the work. The primitive man made work acceptable at the same time that he used it as an equivalent and substitute for sex-activity. The word thus called forth by the common labor had two meanings, designating the sex-act as well as the equivalent labor-activity. In time the word became disassociated from its sexual significance and became fixed on this work. Generations later the same thing happened to a new word that once had sexual significance and came to be used for a new type of work. In this manner a number of word-roots were formed, all of sexual origin, and all of which had lost their sexual significance. If the description sketched here approximates the truth, it opens up the possibility for an understanding of the dream symbolism. We can understand how it is that in the dream, which preserves something of these most ancient conditions, there are so extraordinarily many symbols for the sexual, and why, in general, weapons and implements always stand for the male, materials and things manufactured, for the female. Symbolic relationships would be the remnants of the old word-identity; things which once were called by the same names as the genitals can now appear in the dream as symbols for them.

From our parallels to dream symbolization you may also learn to appreciate what is the character of psychoanalysis which makes it a subject of general interest, which is true of neither psychology nor psychiatry. Psychoanalytic work connects with so many other scientific subjects, the investigation of which promises the most pertinent discoveries, with mythology, with folk-lore, with racial psychology and

with religion. You will understand how a journal can have grown on psychoanalytic soil, the sole purpose of which is the furtherance of these relationships. This is the *Imago* founded in 1912 and edited by Hanns Sachs and Otto Rank. In all of these relations, psychoanalysis is first and foremost the giving, less often the receiving, part. Indeed it derives benefit from the fact that its unusual teachings are substantiated by their recurrence in other fields, but on the whole it is psychoanalysis that provides the technical procedure and the point of view, the use of which will prove fruitful in those other fields. The psychic life of the human individual provides us, upon psychoanalytic investigation, with explanations with which we are able to solve many riddles in the life of humanity, or at least show these riddles in their proper light.

Furthermore, I have not even told you under what conditions we are able to get the deepest insight into that suppositious "fundamental language," or from which field we gain the most information. So long as you do not know this you cannot appreciate the entire significance of the subject. This field is the neurotic, its materials, the symptoms and other expressions of the nervous patient, for the explanation and treatment of which psychoanalysis was devised.

My fourth point of view returns to our premise and connects up with our prescribed course. We said, even if there were no such thing as dream censorship, the dream would still be hard to understand, for we would then be confronted with the task of translating the symbol-language of the dream into the thought of our waking hours. Symbolism is a second and independent item of dream distortion, in addition to dream censorship. It is not a far cry to suppose that it is convenient for the dream censorship to make use of symbolism since both lead to the same end, to making the dream strange and incomprehensible.

Whether or not in the further study of the dream we shall hit upon a new item that influences dream distortion, remains to be seen. I should not like to leave the subject of dream symbolism without once more touching upon the curious fact that it arouses such strong opposition in the case of educated persons, in spite of the fact that symbolism in myth, religion, art and speech is undoubtedly so prevalent. Is not this again because of its relationship to sexuality?

ELEVENTH LECTURE. THE DREAM

The Dream-Work

IF you have mastered dream censorship and symbolic representation, you are, to be sure, not yet adept in dream distortion, but you are nevertheless in a position to understand most dreams. For this you employ two mutually supplementary methods, call up the associations of the dreamer until you have penetrated from the substitute to the actual, and from your own knowledge supply the meaning for the symbol. Later we shall discuss certain uncertainties which show themselves in this process.

We are now in a position to resume work which we attempted, with very insufficient means at an earlier stage, when we studied the relation between the manifest dream elements and their latent actualities, and in so doing established four such main relationships: that of a part of the whole, that of approach or allusion, the symbolic relationship and plastic word representation. We shall now attempt the same on a larger scale, by comparing the manifest dream content as a whole, with the latent dream which we found by interpretation.

I hope you will never again confuse these two. If you have achieved this, you have probably accomplished more in the understanding of the dream than the majority of the readers of my *Interpretation of Dreams*. Let me remind you once more that this process, which changes the latent into the manifest dream, is called *dream-work*. Work which proceeds in the opposite direction, from the manifest dream to the latent, is our *work of interpretation*. The work of interpretation attempts to undo the dream-work. Infantile dreams that are recognized as evident wish fulfillments nevertheless have undergone some dream-work, namely, the transformation of the wish into reality, and generally, too, of thoughts into visual pictures. Here we need no interpretation, but only a retracing of these transformations. Whatever dream-work has been added to other dreams, we call *dream distortion*, and this can be annulled by our work of interpretation.

The comparison of many dream interpretations has rendered it possible for me to give you a coherent representation of what the dream-work does with the material of the latent dream. I beg of you, however, not to expect

to understand too much of this. It is a piece of description that should be listened to with calm attention.

The first process of the dream-work is *condensation*. By this we understand that the manifest dream has a smaller content than the latent one, that is, it is a sort of abbreviated translation of the latter. Condensation may occasionally be absent, but as a rule it is present, often to a very high degree. The opposite is never true, that is, it never occurs that the manifest dream is more extensive in scope and content than the latent. Condensation occurs in the following ways: 1. Certain latent elements are entirely omitted; 2. only a fragment of the many complexes of the latent dream is carried over into the manifest dream; 3. latent elements that have something in common are collected for the manifest dream and are fused into a whole.

If you wish, you may reserve the term “condensation” for this last process alone. Its effects are particularly easy to demonstrate. From your own dreams you will doubtless recall the fusion of several persons into one. Such a compound person probably looks like A., is dressed like B., does something that one remembers of C., but in spite of this one is conscious that he is really D. By means of this compound formation something common to all four people is especially emphasized. One can make a compound formation of events and of places in the same way as of people, provided always that the single events and localities have something in common which the latent dream emphasizes. It is a sort of new and fleeting concept of formation, with the common element as its kernel. This jumble of details that has been fused together regularly results in a vague indistinct picture, as though you had taken several pictures on the same film.

The shaping of such compound formations must be of great importance to the dream-work, for we can prove, (by the choice of a verbal expression for a thought, for instance) that the common elements mentioned above are purposely manufactured where they originally do not exist. We have already become acquainted with such condensation and compound formations; they played an important part in the origin of certain cases of slips of the tongue. You recall the young man who wished to *inscort* a woman. Furthermore, there are jokes whose technique may be traced to such a condensation. But entirely aside from this, one may maintain that this appearance of something quite unknown in the dream finds its

counterpart in many of the creations of our imagination which fuse together component parts that do not belong together in experience, as for example the centaurs, and the fabulous animals of old mythology or of Boecklin's pictures. For creative imagination can invent nothing new whatsoever, it can only put together certain details normally alien to one another. The peculiar thing, however, about the procedure of the dream-work is the following: The material at the disposal of the dream-work consists of thoughts, thoughts which may be offensive and unacceptable, but which are nevertheless correctly formed and expressed. These thoughts are transformed into something else by the dream-work, and it is remarkable and incomprehensible that this translation, this rendering, as it were, into another script or language, employs the methods of condensation and combination. For a translation usually strives to respect the discriminations expressed in the text, and to differentiate similar things. The dream-work, on the contrary, tries to fuse two different thoughts by looking, just as the joke does, for an ambiguous word which shall act as a connecting link between the two thoughts. One need not attempt to understand this feature of the case at once, but it may become significant for the conception of the dream-work.

Although condensation renders the dream opaque, one does not get the impression that it is an effect of dream censorship. One prefers to trace it back to mechanical or economic conditions; but censorship undoubtedly has a share in the process.

The results of condensation may be quite extraordinary. With its help, it becomes possible at times to collect quite unrelated latent thought processes into one manifest dream, so that one can arrive at an apparently adequate interpretation, and at the same time conceive a possible further interpretation.

The consequence of condensation for the relation between latent and manifest dreams is the fact that no simple relations can exist between the elements of the one and the other. A manifest element corresponds simultaneously to several latent ones, and vice versa, a latent element may partake of several manifest ones, an interlacing, as it were. In the interpretation of the dream it also becomes evident that the associations to a single element do not necessarily follow one another in orderly sequence. Often we must wait until the entire dream is interpreted.

Dream-work therefore accomplishes a very unusual sort of transcription of dream thoughts, not a translation word for word, or sign for sign, not a selection according to a set rule, as if all the consonants of a word were given and the vowels omitted; nor is it what we might call substitution, namely, the choice of one element to take the place of several others. It is something very different and much more complicated.

The second process of the dream-work is *displacement*. Fortunately we are already prepared for this, since we know that it is entirely the work of dream censorship. The two evidences of this are firstly, that a latent element is not replaced by one of its constituent parts but by something further removed from it, that is, by a sort of allusion; secondly, that the psychic accent is transferred from an important element to another that is unimportant, so that the dream centers elsewhere and seems strange.

Substitution by allusion is known to our conscious thinking also, but with a difference. In conscious thinking the allusion must be easily intelligible, and the substitute must bear a relation to the actual content. Jokes, too, often make use of allusion; they let the condition of content associations slide and replace it by unusual external associations, such as resemblances in sound, ambiguity of words, etc. They retain, however, the condition of intelligibility; the joke would lose all its effect if the allusion could not be traced back to the actual without any effort whatsoever. The allusion of displacement has freed itself of both these limitations. Its connection with the element which it replaces is most external and remote, is unintelligible for this reason, and if it is retraced, its interpretation gives the impression of an unsuccessful joke or of a forced, far-fetched explanation. For the dream censor has only then accomplished its purpose, when it has made the path of return from the allusion to the original undiscoverable.

The displacement of emphasis is unheard of as a means of expressing thoughts. In conscious thinking we occasionally admit it to gain a comic effect. I can probably give you an idea of the confusion which this produces by reminding you of the story of the blacksmith who had committed a capital crime. The court decided that the penalty for the crime must be paid, but since he was the only blacksmith in the village and therefore indispensable, while there were three tailors, one of the latter was hung in his stead.

The third process of the dream-work is the most interesting from a psychological point of view. It consists of the *translation* of thoughts into visual images. Let us bear in mind that by no means all dream thoughts undergo this translation; many of them retain their form and appear in the manifest dream also as thought or consciousness; moreover, visual images are not the only form into which thoughts are translated. They are, however, the foundation of the dream fabric; this part of the dream work is, as we already know, the second most constant, and for single dream elements we have already learned to know "plastic word representation."

It is evident that this process is not simple. In order to get an idea of its difficulties you must pretend that you have undertaken the task of replacing a political editorial in a newspaper by a series of illustrations, that you have suffered an atavistic return from the use of the alphabet to ideographic writing. Whatever persons or concrete events occur in this article you will be able to replace easily by pictures, perhaps to your advantage, but you will meet with difficulties in the representation of all abstract words and all parts of speech denoting thought relationships, such as particles, conjunctions, etc. With the abstract words you could use all sorts of artifices. You will, for instance, try to change the text of the article into different words which may sound unusual, but whose components will be more concrete and more adapted to representation. You will then recall that most abstract words were concrete before their meaning paled, and will therefore go back to the original concrete significance of these words as often as possible, and so you will be glad to learn that you can represent the "possession" of an object by the actual physical straddling of it. The dream work does the same thing. Under such circumstances you can hardly demand accuracy of representation. You will also have to allow the dream-work to replace an element that is as hard to depict as for instance, broken faith, by another kind of rupture, a broken leg. In this way you will be able to smooth away to some extent the crudity of imagery when the latter is endeavoring to replace word expression.

In the representation of parts of speech that denote thought relations, such as *because*, *therefore*, *but*, etc., you have no such aids; these constituent parts of the text will therefore be lost in your translation into images. In the same way, the dream-work resolves the content of the dream thought into its raw material of objects and activities. You may be satisfied if the possibility is vouchsafed you to suggest certain relations,

not representable in themselves, in a more detailed elaboration of the image. In quite the same way the dream-work succeeds in expressing much of the content of the latent dream thought in the formal peculiarities of the manifest dream, in its clearness or vagueness, in its division into several parts, etc. The number of fragmentary dreams into which the dream is divided corresponds as a rule to the number of main themes, of thought sequences in the latent dream; a short preliminary dream often stands as an introduction or a motivation to the complementary dream which follows; a subordinate clause in dream thought is represented in the manifest dream as an interpolated change of scene, etc. The form of the dream is itself, therefore, by no means without significance and challenges interpretation. Different dreams of the same night often have the same meaning, and testify to an increasing effort to control a stimulus of growing urgency. In a single dream a particularly troublesome element may be represented by "duplicates," that is, by numerous symbols.

By continually comparing dream thought with the manifest dream that replaces it, we learn all sorts of things for which we were not prepared, as for instance, the fact that even the nonsense and absurdity of the dream have meaning. Yes, on this point the opposition between the medical and psychoanalytic conception of the dream reaches a climax not previously achieved. According to the former, the dream is senseless because the dreaming psychic activity has lost all power of critical judgment; according to our theory, on the other hand, the dream becomes senseless, whenever a critical judgment, contained in the dream thought, wishes to express the opinion: "It is nonsense." The dream which you all know, about the visit to the theatre (three tickets 1 Fl. 50 Kr.) is a good example of this. The opinion expressed here is: "It was *nonsense* to marry so early."

In the same way, we discover in interpretation what is the significance of the doubts and uncertainties so often expressed by the dreamer as to whether a certain element really occurred in the dream; whether it was this or something else. As a rule these doubts and uncertainties correspond to nothing in the latent dream thought; they are occasioned throughout by the working of the dream censor and are equivalent to an unsuccessful attempt at suppression.

One of the most surprising discoveries is the manner in which the dream-work deals with those things which are opposed to one another in the latent dream. We already know that agreements in the latent material

are expressed in the manifest dream by condensations. Now oppositions are treated in exactly the same way as agreements and are, with special preference, expressed by the same manifest element. An element in a manifest dream, capable of having an opposite, may therefore represent itself as well as its opposite, or may do both simultaneously; only the context can determine which translation is to be chosen. It must follow from this that the particle "no" cannot be represented in the dream, at least not unambiguously.

The development of languages furnishes us with a welcome analogy for this surprising behavior on the part of the dream work. Many scholars who do research work in languages have maintained that in the oldest languages opposites — such as strong, weak; light, dark; big, little — were expressed by the same root word. (*The Contradictory Sense of Primitive Words.*) In old Egyptian, *ken* originally meant both strong and weak. In conversation, misunderstanding in the use of such ambiguous words was avoided by the tone of voice and by accompanying gestures, in writing by the addition of so-called determinatives, that is, by a picture that was itself not meant to be expressed. Accordingly, if ken meant strong, the picture of an erect little man was placed after the alphabetical signs, if *ken, weak*, was meant, the picture of a cowering man followed. Only later, by slight modifications of the original word, were two designations developed for the opposites which it denoted. In this way, from *ken* meaning both strong and weak, there was derived a *ken*, strong, and a *ken*, weak. It is said that not only the most primitive languages in their last developmental stage, but also the more recent ones, even the living tongues of to-day have retained abundant remains of this primitive opposite meaning. Let me give you a few illustrations of this taken from C. Abel (1884).

In Latin there are still such words of double meaning:

altus — high, deep, and *sacer*, sacred, accursed.

As examples of modifications of the same root, I cite:

clamare — to scream, *clam* — quiet, still, secret;

siccus — dry, *succus* — juice.

And from the German:

Stimme — voice, *stumm* — dumb.

The comparison of related tongues yields a wealth of examples:

English: *lock*; German: *Loch* — hole, *Lücke* — gap.

English: *cleave*; German: *kleben* — to stick, to adhere.

The English *without*, is to-day used to mean “not with”; that “with” had the connotation of deprivation as well as that of apportioning, is apparent from the compounds: *withdraw, withhold*. The German *wieder*, again, closely resembles this.

Another peculiarity of dream-work finds it prototype in the development of language. It occurred in ancient Egyptian as well as in other later languages that the sequence of sounds of the words was transposed to denote the same fundamental idea. The following are examples from English and German:

Topf — pot; *boat — tub*; *hurry — Ruhe* (rest, quiet).

Balken (beam) — *Kloben* (mallet) — *club*.

From the Latin and the German:

capere (to seize) — *packen* (to seize, to grasp).

Inversions such as occur here in the single word are effected in a very different way by the dream-work. We already know the inversion of the sense, substitution by the opposite. Besides there are inversions of situations, of relations between two people, and so in dreams we are in a sort of topsy-turvy world. In a dream it is frequently the rabbit that shoots the hunter. Further inversion occurs in the sequence of events, so that in the dream the cause is placed after the effect. It is like a performance in a third-rate theatre, where the hero falls before the shot which kills him is fired from the wings. Or there are dreams in which the whole sequence of the elements is inverted, so that in the interpretation one must take the last first, and the first last, in order to obtain a meaning. You will recall from our study of dream symbolism that to go or fall into the water means the same as to come out of it, namely, to give birth to, or to be born, and that mounting stairs or a ladder means the same as going down. The advantage that dream distortions may gain from such freedom of representation, is unmistakable.

These features of the dream-work may be called *archaic*. They are connected with ancient systems of expression, ancient languages and literatures, and involve the same difficulties which we shall deal with later in a critical connection.

Now for some other aspects of the matter. In the dream-work it is plainly a question of translating the latent thoughts, expressed in words, into psychic images, in the main, of a visual kind. Now our thoughts were developed from such psychic images; their first material and the steps

which led up to them were psychic impressions, or to be more exact, the memory images of these psychic impressions. Only later were words attached to these and then combined into thoughts. The dream-work therefore puts the thoughts through a *regressive* treatment, that is, one that retraces the steps in their development. In this regression, all that has been added to the thoughts as a new contribution in the course of the development of the memory pictures must fall away.

This, then, is the dream-work. In view of the processes that we have discovered about it, our interest in the manifest dream was forced into the background. I shall, however, devote a few remarks to the latter, since it is after all the only thing that is positively known to us.

It is natural that the manifest dream should lose its importance for us. It must be a matter of indifference to us whether it is well composed or resolved into a series of disconnected single images. Even when its exterior seems to be significant, we know that it has been developed by means of dream distortion and may have as little organic connection with the inner content of the dream as the facade of an Italian church has with its structure and ground plan. At other times this facade of the dream, too, has its significance, in that it reproduces with little or no distortion an important part of the latent dream thought. But we cannot know this before we have put the dream through a process of interpretation and reached a decision as to what amount of distortion has taken place. A similar doubt prevails when two elements in the dream seem to have been brought into close relations to one another. This may be a valuable hint, suggesting that we may join together those manifest thoughts which correspond to the elements in the latent dream; yet at other times we are convinced that what belongs together in thought has been torn apart in the dream.

As a general rule we must refrain from trying to explain one part of the manifest dream by another, as if the dream were coherently conceived and pragmatically represented. At the most it is comparable to a Breccian stone, produced by the fusion of various minerals in such a way that the markings it shows are entirely different from those of the original mineral constituents. There is actually a part of the dream-work, the so-called *secondary treatment*, whose function it is to develop something unified, something approximately coherent from the final products of the dream-work. In so doing the material is often arranged in an entirely misleading sense and insertions are made wherever it seems necessary.

On the other hand, we must not over-estimate the dream-work, nor attribute too much to it. The processes which we have enumerated tell the full tale of its functioning; beyond condensing, displacing, representing plastically, and then subjecting the whole to a secondary treatment, it can do nothing. Whatever of judgment, of criticism, of surprise, and of deduction are to be found in the dream are not products of the dream-work and are only very seldom signs of afterthoughts about the dream, but are generally parts of the latent dream thought, which have passed over into the manifest dream, more or less modified and adapted to the context. In the matter of composing speeches, the dream-work can also do nothing. Except for a few examples, the speeches in the dream are imitations and combinations of speeches heard or made by oneself during the day, and which have been introduced into the latent thought, either as material or as stimuli for the dream. Neither can the dream pose problems; when these are found in the dream, they are in the main combinations of numbers, semblances of examples that are quite absurd or merely copies of problems in the latent dream thought. Under these conditions it is not surprising that the interest which has attached itself to the dream-work is soon deflected from it to the latent dream thoughts which are revealed in more or less distorted form in the manifest dream. It is not justifiable, however, to have this change go so far that in a theoretical consideration one regularly substitutes the latent dream thought for the dream itself, and maintains of the latter what can hold only for the former. It is odd that the results of psychoanalysis should be misused for such an exchange. “Dream” can mean nothing but the result of the dream-work, that is, the *form* into which the latent dream thoughts have been translated by the dream-work.

Dream-work is a process of a very peculiar sort, the like of which has hitherto not been discovered in psychic life. These condensations, displacements, regressive translations of thoughts into pictures, are new discoveries which richly repay our efforts in the field of psychoanalysis. You will realize from the parallel to the dream-work, what connections psychoanalytic studies will reveal with other fields, especially with the development of speech and thought. You can only surmise the further significance of these connections when you hear that the mechanism of the dream structure is the model for the origin of neurotic symptoms.

I know too that we cannot as yet estimate the entire contribution that this work has made to psychology. We shall only indicate the new proofs that have been given of the existence of unconscious psychic acts — for such are the latent dream thoughts — and the unexpectedly wide approach to the understanding of the unconscious psychic life that dream interpretation opens up to us.

The time has probably come, however, to illustrate separately, by various little examples of dreams, the connected facts for which you have been prepared.

TWELFTH LECTURE. THE DREAM

Analysis of Sample Dreams

I HOPE you will not be disappointed if I again lay before you excerpts from dream analyses instead of inviting you to participate in the interpretation of a beautiful long dream. You will say that after so much preparation you ought to have this right, and that after the successful interpretation of so many thousands of dreams it should long ago have become possible to assemble a collection of excellent dream samples with which we could demonstrate all our assertions concerning dream-work and dream thoughts. Yes, but the difficulties which stand in the way of the fulfillment of your wish are too many.

First of all, I must confess to you that no one practices dream interpretation as his main occupation. When does one interpret dreams? Occasionally one can occupy himself with the dream of some friend, without any special purpose, or else he may work with his own dreams for a time in order to school himself in psychoanalytic method; most often, however, one deals with the dreams of nervous individuals who are undergoing analytic treatment. These latter dreams are excellent material, and in no way inferior to those of normal persons, but one is forced by the technique of the treatment to subordinate dream analysis to therapeutic aims and to pass over a large number of dreams after having derived something from them that is of use in the treatment. Many dreams we meet with during the treatment are, as a matter of fact, impossible of complete analysis. Since they spring from the total mass of psychic material which is still unknown to us, their understanding becomes possible only after the completion of the cure. Besides, to tell you such dreams would necessitate the disclosure of all the secrets concerning a neurosis. That will not do for us, since we have taken the dream as preparation for the study of the neuroses.

I know you would gladly leave this material, and would prefer to hear the dreams of healthy persons, or your own dreams explained. But that is impossible because of the content of these dreams. One can expose neither himself, nor another whose confidence he has won, so inconsiderately as would result from a thorough interpretation of his dreams — which, as you already know, refer to the most intimate things of his personality. In

addition to this difficulty, caused by the nature of the material, there is another that must be considered when communicating a dream. You know the dream seems strange even to the dreamer himself, let alone to one who does not know the dreamer. Our literature is not poor in good and detailed dream analyses. I myself have published some in connection with case histories. Perhaps the best example of a dream interpretation is the one published by O. Rank, being two related dreams of a young girl, covering about two pages of print, the analysis covering seventy-six pages. I would need about a whole semester in order to take you through such a task. If we select a longer or more markedly distorted dream, we have to make so many explanations, we must make use of so many free associations and recollections, must go into so many bypaths, that a lecture on the subject would be entirely unsatisfactory and inconclusive. So I must ask you to be content with what is more easily obtained, with the recital of small bits of dreams of neurotic persons, in which we may be able to recognize this or that isolated fact. Dream symbols are the most easily demonstrable, and after them, certain peculiarities of regressive dream representations. I shall tell you why I considered each of the following dreams worthy of communication.

1. A dream, consisting of only two brief pictures: "*The dreamer's uncle is smoking a cigarette, although it is Saturday. A woman caresses him as though he were her child.*"

In commenting on the first picture, the dreamer (a Jew) remarks that his uncle is a pious man who never did, and never would do, anything so sinful as smoking on the Sabbath. As to the woman of the second picture, he has no free associations other than his mother. These two pictures or thoughts should obviously be brought into connection with each other, but how? Since he expressly rules out the reality of his uncle's action, then it is natural to interpolate an "if." "*If* my uncle, that pious man, should smoke a cigarette on Saturday, then I could also permit my mother's caresses." This obviously means that the mother's caresses are prohibited, in the same manner as is smoking on Saturday, to a pious Jew. You will recall, I told you that all relations between the dream thoughts disappear in the dream-work, that these relations are broken up into their raw material, and that it is the task of interpretation to re-interpolate the omitted connections.

2. Through my publications on dreams I have become, in certain respects, the public consultant on matters pertaining to dreams, and for many years I have been receiving communications from the most varied sources, in which dreams are related to me or presented to me for my judgment. I am of course grateful to all those persons who include with the story of the dream, enough material to make an interpretation possible, or who give such an interpretation themselves. It is in this category that the following dream belongs, the dream of a Munich physician in the year 1910. I select it because it goes to show how impossible of understanding a dream generally is before the dreamer has given us what information he has about it. I suspect that at bottom you consider the ideal dream interpretation that in which one simply inserts the meaning of the symbols, and would like to lay aside the technique of free association to the dream elements. I wish to disabuse your minds of this harmful error.

"On July 13, 1910, toward morning, I dreamed *that I was bicycling down a street in Tübingen, when a brown Dachshund tore after me and caught me by the heel. A bit further on I get off, seat myself on a step, and begin to beat the beast, which has clenched its teeth tight.* (*I feel no discomfort from the biting or the whole scene.*) *Two elderly ladies are sitting opposite me and watching me with grins on their faces. Then I wake up and, as so often happens to me, the whole dream becomes perfectly clear to me in this moment of transition to the waking state.*"

Symbols are of little use in this case. The dreamer, however, informs us, "I lately fell in love with a girl, just from seeing her on the street, but had no means of becoming acquainted with her. The most pleasant means might have been the Dachshund, since I am a great lover of animals, and also felt that the girl was in sympathy with this characteristic." He also adds that he repeatedly interfered in the fights of scuffling dogs with great dexterity and frequently to the great amazement of the spectators. Thus we learn that the girl, who pleased him, was always accompanied by this particular dog. This girl, however, was disregarded in the manifest dream, and there remained only the dog which he associates with her. Perhaps the elderly ladies who simpered at him took the place of the girl. The remainder of what he tells us is not enough to explain this point. Riding a bicycle in the dream is a direct repetition of the remembered situation. He had never met the girl with the dog except when he was on his bicycle.

3. When anyone has lost a loved one, he produces dreams of a special sort for a long time afterward, dreams in which the knowledge of death enters into the most remarkable compromises with the desire to have the deceased alive again. At one time the deceased is dead and yet continues to live on because he does not know that he is dead, and would die completely only if he knew it; at another time he is half dead and half alive, and each of these conditions has its particular signs. One cannot simply label these dreams nonsense, for to come to life again is no more impossible in the dream than, for example, it is in the fairy story, in which it occurs as a very frequent fate. As far as I have been able to analyze such dreams, I have always found them to be capable of a sensible solution, but that the pious wish to recall the deceased to life goes about expressing itself by the oddest methods. Let me tell you such a dream, which seems queer and senseless enough, and analysis of which will show you many of the points for which you have been prepared by our theoretical discussions. The dream is that of a man who had lost his father many years previously.

"*Father is dead, but has been exhumed and looks badly. He goes on living, and the dreamer does everything to prevent him from noticing that fact.*" Then the dream goes on to other things, apparently irrelevant.

The father is dead, that we know. That he was exhumed is not really true, nor is the truth of the rest of the dream important. But the dreamer tells us that when he came back from his father's funeral, one of his teeth began to ache. He wanted to treat this tooth according to the Jewish precept, "If thy tooth offend thee, pluck it out," and betook himself to the dentist. But the latter said, "One does not simply pull a tooth out, one must have patience with it. I shall inject something to kill the nerve. Come again in three days and then I will take it out."

"This 'taking it out'," says the dreamer suddenly, "is the exhuming."

Is the dreamer right? It does not correspond exactly, only approximately, for the tooth is not taken out, but something that has died off is taken out of it. But after our other experiences we are probably safe in believing that the dream work is capable of such inaccuracies. It appears that the dreamer condensed, fused into one, his dead father and the tooth that was killed but retained. No wonder then, that in the manifest dream something senseless results, for it is impossible for everything that is said of the tooth to fit the father. What is it that serves as something

intermediate between tooth and father and makes this condensation possible?

This interpretation must be correct, however, for the dreamer says that he is acquainted with the saying that when one dreams of losing a tooth it means that one is going to lose a member of his family.

We know that this popular interpretation is incorrect, or at least is correct only in a scurrilous sense. For that reason it is all the more surprising to find this theme thus touched upon in the background of other portions of the dream content.

Without any further urging, the dreamer now begins to tell of his father's illness and death as well as of his relations with him. The father was sick a long time, and his care and treatment cost him, the son, much money. And yet it was never too much for him, he never grew impatient, never wished it might end soon. He boasts of his true Jewish piety toward his father, of rigid adherence to the Jewish precepts. But are you not struck by a contradiction in the thoughts of the dream? He had identified tooth with father. As to the tooth he wanted to follow the Jewish precept that carries out its own judgment, "pull it out if it causes pain and annoyance." He had also been anxious to follow the precept of the law with regard to his father, which in this case, however, tells him to disregard trouble and expense, to take all the burdens upon himself and to let no hostile intent arise toward the object which causes the pain. Would not the agreement be far more compelling if he had really developed feelings toward his father similar to those about his sick tooth; that is, had he wished that a speedy death should put an end to that superfluous, painful and expensive existence?

I do not doubt that this was really his attitude toward his father during the latter's extended illness, and that his boastful assurances of filial piety were intended to distract his attention from these recollections. Under such circumstances, the death-wish directed toward the parent generally becomes active, and disguises itself in phrases of sympathetic consideration such as, "It would really be a blessed release for him." But note well that we have here overcome an obstacle in the latent dream thoughts themselves. The first part of these thoughts was surely unconscious only temporarily, that is to say, during the dream-work, while the inimical feelings toward the father might have been permanently unconscious, dating perhaps from childhood, occasionally slipping into

consciousness, shyly and in disguise, during his father's illness. We can assert this with even greater certainty of other latent thoughts which have made unmistakable contributions to the dream content. To be sure, none of these inimical feelings toward the father can be discovered in the dream. But when we search a childhood history for the root of such enmity toward the father, we recollect that fear of the father arises because the latter, even in the earliest years, opposes the boy's sex activities, just as he is ordinarily forced to oppose them again, after puberty, for social motives. This relation to the father applies also to our dreamer; there had been mixed with his love for him much respect and fear, having its source in early sex intimidation.

From the onanism complex we can now explain the other parts of the manifest dream. "*He looks badly*" does, to be sure, allude to another remark of the dentist, that it looks badly to have a tooth missing in that place; but at the same time it refers to the "looking badly" by which the young man betrayed, or feared to betray, his excessive sexual activity during puberty. It was not without lightening his own heart that the dreamer transposed the bad looks from himself to his father in the manifest content, an inversion of the dream work with which you are familiar. "*He goes on living since then*," disguises itself with the wish to have him alive again as well as with the promise of the dentist that the tooth will be preserved. A very subtle phrase, however, is the following: "The dreamer does everything *to prevent him* (*the father*) *from noticing the fact*," a phrase calculated to lead us to conclude that he is dead. Yet the only meaningful conclusion is again drawn from the onanism complex, where it is a matter of course for the young man to do everything in order to hide his sex life from his father. Remember, in conclusion, that we were constantly forced to interpret the so-called tooth-ache dreams as dreams dealing with the subject of onanism and the punishment that is feared.

You now see how this incomprehensible dream came into being, by the creation of a remarkable and misleading condensation, by the fact that all the ideas emerge from the midst of the latent thought process, and by the creation of ambiguous substitute formations for the most hidden and, at the time, most remote of these thoughts.

4. We have tried repeatedly to understand those prosaic and banal dreams which have nothing foolish or repulsive about them, but which cause us to ask: "Why do we dream such unimportant stuff?" So I shall

give you a new example of this kind, three dreams belonging together, all of which were dreamed in the same night by a young woman.

(*a*). "*She it going through the hall of her house and strikes her head against the low-hanging chandelier, so that her head bleeds.*"

She has no reminiscence to contribute, nothing that really happened. The information she gives leads in quite another direction. "You know how badly my hair is falling out. Mother said to me yesterday, 'My child, if it goes on like this, you will have a head like the cheek of a buttock.'" Thus the head here stands for the other part of the body. We can understand the chandelier symbolically without other help; all objects that can be lengthened are symbols of the male organ. Thus the dream deals with a bleeding at the lower end of the body, which results from its collision with the male organ. This might still be ambiguous; her further associations show that it has to do with her belief that menstrual bleeding results from sexual intercourse with a man, a bit of sexual theory believed by many immature girls.

(*b*). "*She sees a deep hole in the vineyard which she knows was made by pulling out a tree.*" Herewith her remark that "*she misses the tree*." She means that she did not see the tree in the dream, but the same phrase serves to express another thought which symbolic interpretation makes completely certain. The dream deals with another bit of the infantile sex theory, namely, with the belief that girls originally had the same genitals as boys and that the later conformation resulted from castration (pulling out of a tree).

(*c*). "*She is standing in front of the drawer of her writing table, with which she is so familiar that she knows immediately if anybody has been through it.*" The writing-table drawer, like every drawer, chest, or box, stands for the female genital. She knows that one can recognize from the genital the signs of sexual intercourse (and, as she thinks, even of any contact at all) and she has long been afraid of such a conviction. I believe that the accent in all these dreams is to be laid upon the idea of *knowing*. She is reminded of the time of her childish sexual investigations, the results of which made her quite proud at the time.

5. Again a little bit of symbolism. But this time I must first describe the psychic situation in a short preface. A man who spent the night with a woman describes his partner as one of those motherly natures whose desire for a child irresistibly breaks through during intercourse. The

circumstances of their meeting, however, necessitated a precaution whereby the fertilizing discharge of semen is kept away from the womb. Upon awaking after this night, the woman tells the following dream:

"*An officer with a red cap follows her on the street. She flees from him, runs up the staircase, and he follows after her. Breathlessly she reaches her apartment and slams and locks the door behind her. He remains outside and as she looks through a peephole she sees him sitting outside on a bench and weeping.*"

You undoubtedly recognize in the pursuit by an officer with a red cap, and the breathless stair climbing, the representation of the sexual act. The fact that the dreamer locks herself in against the pursuer may serve as an example of that inversion which is so frequently used in dreams, for in reality it was the man who withdrew before the completion of the act. In the same way her grief has been transposed to the partner, it is he who weeps in the dream, whereby the discharge of the semen is also indicated.

You must surely have heard that in psychoanalysis it is always maintained that all dreams have a sexual meaning. Now you yourselves are in a position to form a judgment as to the incorrectness of this reproach. You have become acquainted with the wish-fulfillment dreams, which deal with the satisfying of the plainest needs, of hunger, of thirst, of longing for freedom, the dreams of convenience and of impatience and likewise the purely covetous and egoistic dreams. But that the markedly distorted dreams preponderantly — though again not exclusively — give expression to sex wishes, is a fact you may certainly keep in mind as one of the results of psychoanalytical research.

6. I have a special motive for piling up examples of the use of symbols in dreams. At our first meeting I complained of how hard it is, when lecturing on psychoanalysis, to demonstrate the facts in order to awaken conviction; and you very probably have come to agree with me since then. But the various assertions of psychoanalysis are so closely linked that one's conviction can easily extend from one point to a larger part of the whole. We might say of psychoanalysis that if we give it our little finger it promptly demands the whole hand. Anyone who was convinced by the explanation of errors can no longer logically disbelieve in all the rest of psychoanalysis. A second equally accessible point of approach is furnished by dream symbolism. I shall give you a dream, already published, of a peasant woman, whose husband is a watchman and who has certainly

never heard anything about dream symbolism and psychoanalysis. You may then judge for yourselves whether its explanation with the help of sex symbols can be called arbitrary and forced.

"*Then someone broke into her house and she called in fright for a watchman. But the latter had gone companionably into a church together with two 'beauties.' A number of steps led up to the church. Behind the church was a hill, and on its crest a thick forest. The watchman was fitted out with a helmet, gorget and a cloak. He had a full brown beard. The two were going along peacefully with the watchman, had sack-like aprons bound around their hips. There was a path from the church to the hill. This was overgrown on both sides with grass and underbrush that kept getting thicker and that became a regular forest on the crest of the hill.*"

You will recognize the symbols without any difficulty. The male genital is represented by a trinity of persons, the female by a landscape with a chapel, hill and forest. Again you encounter steps as the symbol of the sexual act. That which is called a hill in the dream has the same name in anatomy, namely, *mons veneris*, the mount of Venus.

7. I have another dream which can be solved by means of inserting symbols, a dream that is remarkable and convincing because the dreamer himself translated all the symbols, even though he had had no preliminary knowledge of dream interpretation. This situation is very unusual and the conditions essential to its occurrence are not clearly known.

"*He is going for a walk with his father in some place which must be the Prater, for one can see the rotunda and before it a smaller building to which is anchored a captive balloon, which, however, seems fairly slack. His father asks him what all that is for; he wonders at it himself but explains it to his father. Then they come to a courtyard in which there lies spread out a big sheet of metal. His father wants to break off a big piece of it for himself but first looks about him to see if anyone might see him. He says to him that all he needs to do is to tell the inspector and then he can take some without more ado. There are steps leading from this courtyard down into a pit, the walls of which are upholstered with some soft material rather like a leather arm chair. At the end of this pit is a longish platform and then a new pit begins....*"

The dreamer himself interprets as follows: "The rotunda is my genital, the balloon in front of it is my penis, of whose slackness I have been complaining." Thus one may translate in more detail, that the rotunda is

the posterior — a part of the body which the child regularly considers as part of the genital — while the smaller building before it is the scrotum. In the dream his father asks him what all that is for; that is to say, he asks the object and function of the genitals. It is easy to turn this situation around so that the dreamer is the one who does the asking. Since no such questioning of the father ever took place in real life, we must think of the thought of this dream as a wish or consider it in the light of a supposition, "If I had asked father for sexual enlightenment." We will find the continuation of this idea in another place shortly.

The courtyard, in which the sheet metal lies spread out, is not to be considered primarily as symbolical but refers to the father's place of business. For reasons of discretion I have substituted the "sheet metal" for another material with which the father deals, without changing anything in the literal wording of the dream. The dreamer entered his father's business and took great offense at the rather dubious practices upon which the profits depended to a large extent. For this reason the continuation of the above idea of the dream might be expressed as "if I had asked him, he would only have deceived me as he deceives his customers." The dreamer himself gives us the second meaning of "breaking off the metal," which serves to represent the commercial dishonesty. He says it means masturbation. Not only have we long since become familiar with this symbol, but the fact also is in agreement. The secrecy of masturbation is expressed by means of its opposite— "It can be safely done openly." Again our expectations are fulfilled by the fact that masturbatory activity is referred to as the father's, just as the questioning was in the first scene of the dream. Upon being questioned he immediately gives the interpretation of the pit as the vagina on account of the soft upholstering of its walls. I will add arbitrarily that the "going down" like the more usual "going up" is meant to describe the sexual intercourse in the vagina.

Such details as the fact that the first pit ends in a platform and then a new one begins, he explains himself as having been taken from his own history. He practiced intercourse for a while, then gave it up on account of inhibitions, and now hopes to be able to resume it as a result of the treatment.

8. The two following dreams are those of a foreigner, of very polygamous tendencies, and I give them to you as proof for the claim that

one's ego appears in every dream, even in those in which it is disguised in the manifest content. The trunks in the dream are a symbol for woman.

(*a*). "*He is to take a trip, his luggage is placed on a carriage to be taken to the station, and there are many trunks piled up, among which are two big black ones like sample trunks. He says, consolingly, to someone, 'Well, they are only going as far as the station with us.'*"

In reality he does travel with a great deal of luggage, but he also brings many tales of women with him when he comes for treatment. The two black trunks stand for two dark women who play the chief part in his life at present. One of them wanted to travel to Vienna after him, but he telegraphed her not to, upon my advice.

(*b*). A scene at the customs house: "*A fellow traveler opens his trunk and says indifferently while puffing a cigarette, 'There's nothing in here.' The customs official seems to believe him but delves into the trunk once more and finds something particularly forbidden. The traveler then says resignedly, 'Well, there's no help for it.'*"

He himself is the traveler, I the customs official. Though otherwise very frank in his confessions, he has on this occasion tried to conceal from me a new relationship which he had struck up with a lady whom he was justified in believing that I knew. The painful situation of being convicted of this is transposed into a strange person so that he himself apparently is not present in the dream.

9. The following is an example of a symbol which I have not yet mentioned:

"*He meets his sister in company with two friends who are themselves sisters. He extends his hand to both of them but not to his sister.*"

This is no allusion to a real occurrence. His thoughts instead lead him back to a time when his observations made him wonder why a girl's breasts develop so late. The two sisters, therefore, are the breasts. He would have liked to touch them if only it had not been his sister.

10. Let me add an example of a symbol of death in a dream:

"*He is walking with two persons whose name he knows but has forgotten. By the time he is awake, over a very high, steep iron bridge. Suddenly the two people are gone and he sees a ghostly man with a cap, and clad in white. He asks this man whether he is the telegraph messenger.... No. Or is he a coachman? No. Then he goes on,*" and even in the dream he is in great fear. After waking he continues the dream by a

phantasy in which the iron bridge suddenly breaks, and he plunges into the abyss.

When the dreamer emphasizes the fact that certain individuals in a dream are unknown, that he has forgotten their names, they are generally persons standing in very close relationship to the dreamer. This dreamer has two sisters; if it be true, as his dream indicates, that he wished these two dead, then it would only be justice if the fear of death fell upon him for so doing. In connection with the telegraph messenger he remarks that such people always bring bad news. Judged by his uniform he might also have been the lamp-lighter, who, however, also extinguishes the lamps — in other words, as the spirit of death extinguishes the flame of life. The coachman reminds him of Uhland's poem of King Karl's ocean voyage and also of a dangerous lake trip with two companions in which he played the role of the king in the poem. In connection with the iron bridge he remembers a recent accident and the stupid saying "Life is a suspension bridge."

11. The following may serve as another example of the representation of death in a dream: "*An unknown man leaves a black bordered visiting card for him.*"

12. The following dream will interest you for several reasons, though it is one arising from a neurotic condition among other things:

"*He is traveling in a train. The train stops in an open field. He thinks it means that there is going to be an accident, that he must save himself, and he goes through all the compartments of the train and strikes dead everyone whom he meets, conductors, engine drivers, etc.*"

In connection with this he tells a story that one of his friends told him. An insane man was being transported in a private compartment in a certain place in Italy, but through some mistake another traveler was put in the same compartment. The insane man murdered his fellow passenger. Thus he identifies himself with this insane person and bases his right so to do upon a compulsive idea which was then torturing him, namely, he must "do away with all persons who knew of his failings." But then he himself finds a better motivation which gave rise to the dream. The day before, in the theatre, he again saw the girl whom he had expected to marry but whom he had left because she had given him cause for jealousy. With a capacity for intense jealousy such as he has, he would really be insane if he married. In other words, he considers her so untrustworthy that out of

jealousy he would have to strike dead all the persons who stood in his way. Going through a series of rooms, of compartments in this case, we have already learned to recognize as the symbol of marriage (the opposite of monogamy).

In connection with the train stopping in the open country and his fear of an accident, he tells the following: Once, when he was traveling in a train and it came to a sudden stop outside of a station, a young lady in the compartment remarked that perhaps there was going to be a collision, and that in that case the best precaution would be to pull one's legs up. But this "legs up" had also played a role in the many walks and excursions into the open which he had taken with the girl in that happy period in their first love. Thus it is a new argument for the idea that he would have to be crazy in order to marry her now. But from my knowledge of the situation I can assume with certainty that the wish to be as crazy as that nevertheless exists in him.

THIRTEENTH LECTURE. THE DREAM

Archaic Remnants and Infantilism in the Dream

LET us revert to our conclusion that the dream-work, under the influence of the dream censorship, transforms the latent dream thoughts into some other form of expression. The latent thoughts are no other than the conscious thoughts known to us in our waking hours; the new mode of expression is incomprehensible to us because of its many-sided features. We have said it extends back to conditions of our intellectual development which we have long progressed beyond, to the language of pictures, the symbol-representations, perhaps to those conditions which were in force before the development of our language of thought. So we called the mode of expression of the dream-work the archaic or regressive.

You may conclude that as a result of the deeper study of the dream-work we gain valuable information about the rather unknown beginnings of our intellectual development. I trust this will be true, but this work has not, up to the present time, been undertaken. The antiquity into which the dream-work carries us back is of a double aspect, firstly, the individual antiquity, childhood; and, secondly (in so far as every individual in his childhood lives over again in some more or less abbreviated manner the entire development of the human race), also this antiquity, the philogenetic. That we shall be able to differentiate which part of the latent psychic proceeding has its source in the individual, and which part in the philogenetic antiquity is not improbable. In this connection it appears to me, for example, that the symbolic relations which the individual has never learned are ground for the belief that they should be regarded as a philogenetic inheritance.

However, this is not the only archaic characteristic of the dream. You probably all know from your own experiences the peculiar amnesia, that is, loss of memory, concerning childhood. I mean the fact that the first years, to the fifth, sixth or eighth, have not left the same traces in our memory as have later experiences. One meets with individual persons, to be sure, who can boast of a continuous memory from the very beginning to the present day, but the other condition, that of a gap in the memory, is far more frequent. I believe we have not laid enough stress on this fact. The child is able to speak well at the age of two, it soon shows that it can

become adjusted to the most complicated psychic situations, and makes remarks which years later are retold to it, but which it has itself entirely forgotten. Besides, the memory in the early years is more facile, because it is less burdened than in later years. Nor is there any reason for considering the memory-function as a particularly high or difficult psychic performance; in fact, the contrary is true, and you can find a good memory in persons who stand very low intellectually.

As a second peculiarity closely related to the first, I must point out that certain well-preserved memories, for the most part formatively experienced, stand forth in this memory-void which surrounds the first years of childhood and do not justify this hypothesis. Our memory deals selectively with its later materials, with impressions which come to us in later life. It retains the important and discards the unimportant. This is not true of the retained childhood memories. They do not bespeak necessarily important experiences of childhood, not even such as from the viewpoint of the child need appear of importance. They are often so banal and intrinsically so meaningless that we ask ourselves in wonder why just these details have escaped being forgotten. I once endeavored to approach the riddle of childhood amnesia and the interrupted memory remnants with the help of analysis, and I arrived at the conclusion that in the case of the child, too, only the important has remained in the memory, except that by means of the process of condensation already known to you, and especially by means of distortion, the important is represented in the memory by something that appears unimportant. For this reason I have called these childhood memories “disguise-memories,” memories used to conceal; by means of careful analysis one is able to develop out of them everything that is forgotten.

In psychoanalytic treatment we are regularly called upon to fill out the infantile memory gaps, and in so far as the cure is to any degree successful, we are able again to bring to light the content of the childhood years thus clouded in forgetfulness. These impressions have never really been forgotten, they have only been inaccessible, latent, have belonged to the unconscious. But sometimes they bob up out of the unconscious spontaneously, and, as a matter of fact, this is what happens in dreams. It is apparent that the dream life knows how to find the entrance to these latent, infantile experiences. Beautiful examples of this occur in literature, and I myself can present such an example. I once dreamed in a certain

connection of a person who must have performed some service for me, and whom I clearly saw. He was a one-eyed man, short in stature, stout, his head deeply sunk into his neck. I concluded from the content that he was a physician. Luckily I was able to ask my mother, who was still living, how the physician in my birth-place, which I left when I was three years old, looked, and I learned from her that he had one eye, was short and stout, with his head sunk into his neck, and also learned at what forgotten mishap he had been of service to me. This control over the forgotten material of childhood years is, then, a further archaic tendency of the dream.

The same information may be made use of in another of the puzzles that have presented themselves to us. You will recall how astonished people were when we came to the conclusion that the stimuli which gave rise to dreams were extremely bad and licentious sexual desires which have made dream-censorship and dream-distortion necessary. After we have interpreted such a dream for the dreamer and he, in the most favorable circumstances does not attack the interpretation itself, he almost always asks the question whence such a wish comes, since it seems foreign to him and he feels conscious of just the opposite sensations. We need not hesitate to point out this origin. These evil wish-impulses have their origin in the past, often in a past which is not too far away. It can be shown that at one time they were known and conscious, even if they no longer are so. The woman, whose dream is interpreted to mean that she would like to see her seventeen-year old daughter dead, discovers under our guidance that she in fact at one time entertained this wish. The child is the fruit of an unhappy marriage, which early ended in a separation. Once, while the child was still in the womb, and after a tense scene with her husband, she beat her body with her fists in a fit of anger, in order to kill the child. How many mothers who to-day love their children tenderly, perhaps too tenderly, received them unwillingly, and at the time wished that the life within them would not develop further; indeed, translated this wish into various actions, happily harmless. The later death-wish against some loved one, which seems so strange, also has its origin in early phases of the relationship to that person.

The father, the interpretation of whose dream shows that he wishes for the death of his eldest and favorite child, must be reminded of the fact that at one time this wish was no stranger to him. While the child was still a suckling, this man, who was unhappy in his choice of a wife, often thought

that if the little being that meant nothing to him would die, he would again be free, and would make better use of his freedom. A like origin may be found for a large number of similar hate impulses; they are recollections of something that belonged to the past, were once conscious and played their parts in the psychic life. You will wish to conclude therefrom that such wishes and such dreams cannot occur if such changes in the relationship to a person have not taken place; if such relationship was always of the same character. I am ready to admit this, only wish to warn you that you are to take into consideration not the exact terms of the dream, but the meaning thereof according to its interpretation. It may happen that the manifest dream of the death of some loved person has only made use of some frightful mask, that it really means something entirely different, or that the loved person serves as a concealing substitute for some other.

But the same circumstances will call forth another, more difficult question. You say: “Granted this death wish was present at some time or other, and is substantiated by memory, yet this is no explanation. It is long outlived, to-day it can be present only in the unconscious and as an empty, emotionless memory, but not as a strong impulse. Why should it be recalled by the dream at all!” This question is justified. The attempt to answer it would lead us far afield and necessitate taking up a position in one of the most important points of dream study. But I must remain within the bounds of our discussion and practice restraint. Prepare yourselves for the temporary abstention. Let us be satisfied with the circumstantial proof that this outlived wish can be shown to act as a dream stimulator and let us continue the investigation to see whether or not other evil wishes admit of the same derivation out of the past.

Let us continue with the removal or death-wish which most frequently can be traced back to the unbounded egoism of the dreamer. Such a wish can very often be shown to be the inciting cause of the dream. As often as someone has been in our way in life — and how often must this happen in the complicated relationships of life — the dream is ready to do away with him, be he father, mother, brother, sister, spouse, etc. We have wondered sufficiently over this evil tendency of human nature, and certainly were not predisposed to accept the authenticity of this result of dream interpretation without question. After it has once been suggested to us to seek the origin of such wishes in the past, we disclose immediately the

period of the individual past in which such egoism and such wish-impulses, even as directed against those closest to the dreamer, are no longer strangers. It is just in these first years of childhood which later are hidden by amnesia, that this egoism frequently shows itself in most extreme form, and from which regular but clear tendencies thereto, or real remnants thereof, show themselves. For the child loves itself first, and later learns to love others, to sacrifice something of its ego for another. Even those persons whom the child seems to love from the very beginning, it loves at the outset because it has need of them, cannot do without them, in others words, out of egoistical motives. Not until later does the love impulse become independent of egoism. *In brief, egoism has taught the child to love.*

In this connection it is instructive to compare the child's regard for his brothers and sisters with that which he has for his parents. The little child does not necessarily love his brothers and sisters, often, obviously, he does not love them at all. There is no doubt that in them he hates his rivals and it is known how frequently this attitude continues for many years until maturity, and even beyond, without interruption. Often enough this attitude is superseded by a more tender feeling, or rather let us say glossed over, but the hostile feeling appears regularly to have been the earlier. It is most noticeable in children of from two and one-half to four or five years of age, when a new little brother or sister arrives. The latter is usually received in a far from friendly manner. Expressions such as "I don't want him! Let the stork take him away again," are very usual. Subsequently every opportunity is made use of to disparage the new arrival, and even attempts to do him bodily harm, direct attacks, are not unheard of. If the difference in age is less, the child learns of the existence of the rival with intense psychic activity, and accommodates himself to the new situation. If the difference in age is greater, the new child may awaken certain sympathies as an interesting object, as a sort of living doll, and if the difference is eight years or more, motherly impulses, especially in the case of girls, may come into play. But to be truthful, when we disclose in a dream the wish for the death of a mother or sister we need seldom find it puzzling and may trace its origin easily to early childhood, often enough, also, to the propinquity of later years.

Probably no nurseries are free from mighty conflicts among the inhabitants. The motives are rivalry for the love of the parents, articles

owned in common, the room itself. The hostile impulses are called forth by older as well as younger brothers and sisters. I believe it was Bernard Shaw who said: “If there is anyone who hates a young English lady more than does her mother, it is her elder sister.” There is something about this saying, however, that arouses our antipathy. We can, at a pinch, understand hatred of brothers and sisters, and rivalry among them, but how may feelings of hatred force their way into the relationship between daughter and mother, parents and children?

This relationship is without doubt the more favorable, even when looked at from the viewpoint of the child. This is in accord with our expectation; we find it much more offensive for love between parents and children to be lacking than for love between brothers and sisters. We have, so to speak, made something holy in the first instance which in the other case we permitted to remain profane. But daily observation can show us how frequently the feelings between parents and their grown children fail to come up to the ideal established by society, how much enmity exists and would find expression did not accumulations of piety and of tender impulse hold them back. The motives for this are everywhere known and disclose a tendency to separate those of the same sex, daughter from mother, father from son. The daughter finds in her mother the authority that hems in her will and that is entrusted with the task of causing her to carry out the abstention from sexual liberty which society demands; in certain cases also she is the rival who objects to being displaced. The same type of thing occurs in a more glaring manner between father and son. To the son the father is the embodiment of every social restriction, borne with such great opposition; the father bars the way to freedom of will, to early sexual satisfaction, and where there is family property held in common, to the enjoyment thereof. Impatient waiting for the death of the father grows to heights approximating tragedy in the case of a successor to the throne. Less strained is the relationship between father and daughter, mother and son. The latter affords the purest examples of an unalterable tenderness, in no way disturbed by egoistical considerations.

Why do I speak of these things, so banal and so well known? Because there is an unmistakable disposition to deny their significance in life, and to set forth the ideal demanded by society as a fulfilled thing much oftener than it really is fulfilled. But it is preferable for psychology to speak the truth, rather than that this task should be left to the cynic. In any event,

this denial refers only to actual life. The arts of narrative and dramatic poetry are still free to make use of the motives that result from a disturbance of this ideal.

It is not to be wondered at that in the case of a large number of people the dream discloses the wish for the removal of the parents, especially the parent of the same sex. We may conclude that it is also present during waking hours, and that it becomes conscious even at times when it is able to mask itself behind another motive, as in the case of the dreamer's sympathy for his father's unnecessary sufferings in example 3. It is seldom that the enmity alone controls the relationship; much more often it recedes behind more tender impulses, by which it is suppressed, and must wait until a dream isolates it. That which the dream shows us in enlarged form as a result of such isolation, shrinks together again after it has been properly docketed in its relation to life as a result of our interpretation (H. Sachs). But we also find this dream wish in places where it has no connection with life, and where the adult, in his waking hours, would never recognize it. The reason for this is that the deepest and most uniform motive for becoming unfriendly, especially between persons of the same sex, has already made its influence felt in earliest childhood.

I mean the love rivalry, with the especial emphasis of the sex character. The son, even as a small child, begins to develop an especial tenderness for his mother, whom he considers as his own property, and feels his father to be a rival who puts into question his individual possession; and in the same manner the little daughter sees in her mother a person who is a disturbing element in her tender relationship with her father, and who occupies a position that she could very well fill herself. One learns from these observations to what early years these ideas extend back — ideas which we designate as the *Oedipus-complex,* because this myth realizes with a very slightly weakened effect the two extreme wishes which grow out of the situation of the son — to kill his father and take his mother to wife. I do not wish to maintain that the Oedipus-complex covers entirely the relation of the child to its parents; this relation can be much more complicated. Furthermore, the Oedipus-complex is more or less well-developed; it may even experience a reversal, but it is a customary and very important factor in the psychic life of the child; and one tends rather to underestimate than to overestimate its influence and the developments which may follow from it. In addition, children frequently react to the

Oedipus-idea through stimulation by the parents, who in the placing of their affection are often led by sex-differences, so that the father prefers the daughter, the mother the son; or again, where the marital affection has cooled, and this love is substituted for the outworn love.

One cannot maintain that the world was very grateful to psychoanalytic research for its discovery of the Oedipus-complex. On the contrary, it called forth the strongest resistance on the part of adults; and persons who had neglected to take part in denying this proscribed or tabooed feeling-relationship later made good the omission by taking all value from the complex through false interpretations. According to my unchanged conviction there is nothing to deny and nothing to make more palatable. One should accept the fact, recognized by the Greek myth itself, as inevitable destiny. On the other hand, it is interesting that this Oedipus-complex, cast out of life, was yielded up to poetry and given the freest play. O. Rank has shown in a careful study how this very Oedipus-complex has supplied dramatic literature with a large number of motives in unending variations, derivations and disguises, also in distorted forms such as we recognize to be the work of a censor. We may also ascribe this Oedipus-complex to those dreamers who were so fortunate as to escape in later life these conflicts with their parents, and intimately associated therewith we find what we call the *castration complex*, the reaction to sexual intimidation or restriction, ascribed to the father, of early infantile sexuality.

By applying our former researches to the study of the psychic life of the child, we may expect to find that the origin of other forbidden dream-wishes, of excessive sexual impulses, may be explained in the same manner. Thus we are moved to study the development of sex-life in the child also, and we discover the following from a number of sources: In the first place, it is a mistake to deny that the child has a sexual life, and to take it for granted that sexuality commences with the ripening of the genitals at the time of puberty. On the contrary — the child has from the very beginning a sexual life rich in content and differing in numerous respects from that which is later considered normal. What we call “perverse” in the life of the adult, differs from the normal in the following respects: first, in disregard for the dividing line of species (the gulf between man and animal); second, being insensible to the conventional feeling of disgust; third, the incest-limitation (being prohibited from

seeking sexual satisfaction with near blood-relations); fourth, homosexuality, and fifth, transferring the role of the genitals to other organs and other parts of the body. None of these limitations exist in the beginning, but are gradually built up in the course of development and education. The little child is free from them. He knows no unbridgable chasm between man and animal; the arrogance with which man distinguishes himself from the animal is a later acquisition. In the beginning he is not disgusted at the sight of excrement, but slowly learns to be so disgusted under the pressure of education; he lays no special stress on the difference between the sexes, rather accredits to both the same genital formation; he directs his earliest sexual desires and his curiosity toward those persons closest to him, and who are dear to him for various reasons — his parents, brothers and sisters, nurses; and finally, you may observe in him that which later breaks through again, raised now to a love attraction, viz., that he does not expect pleasure from his sexual organs alone, but that many other parts of the body portray the same sensitiveness, are the media of analogous sensations, and are able to play the role of the genitals. The child may, then, be called “polymorphus perverse,” and if he makes but slight use of all these impulses, it is, on the one hand, because of their lesser intensity as compared to later life, and on the other hand, because the bringing up of the child immediately and energetically suppresses all his sexual expressions. This suppression continues in theory, so to say, since the grown-ups are careful to control part of the childish sex-expressions, and to disguise another part by misrepresenting its sexual nature until they can deny the whole business. These are often the same persons who discourse violently against all the sexual faults of the child and then at the writing table defend the sexual purity of the same children. Where children are left to themselves or are under the influence of corruption, they often are capable of really conspicuous performances of perverse sexual activity. To be sure, the grown-ups are right in looking upon these things as “childish performances,” as “play,” for the child is not to be judged as mature and answerable either before the bar of custom or before the law, but these things do exist, they have their significance as indications of innate characteristics as well as causes and furtherances of later developments, they give us an insight into childhood sex-life and thereby into the sex life of man. When we rediscover in the background of our distorted dreams all

these perverse wish-impulses, it means only that the dream has in this field traveled back to the infantile condition.

Especially noteworthy among these forbidden wishes are those of incest, i.e., those directed towards sexual intercourse with parents and brothers and sisters. You know what antipathy society feels toward such intercourse, or at least pretends to feel, and what weight is laid on the prohibitions directed against it. The most monstrous efforts have been made to explain this fear of incest. Some have believed that it is due to evolutionary foresight on the part of nature, which is psychically represented by this prohibition, because inbreeding would deteriorate the race-character; others maintained that because of having lived together since early childhood the sexual desire is diverted from the persons under consideration. In both cases, furthermore, the incest-avoidance would be automatically assured, and it would be difficult to understand the need of strict prohibitions, which rather point to the presence of a strong desire. Psychoanalytic research has incontrovertibly shown that the incestuous love choice is rather the first and most customary choice, and that not until later is there any resistance, the source of which probably is to be found in the individual psychology.

Let us sum up what our plunge into child psychology has given us toward the understanding of the dream. We found not only that the materials of forgotten childhood experiences are accessible to the dream, but we saw also that the psychic life of children, with all its peculiarities, its egoism, its incestuous love-choice, etc., continues, for the purposes of the dream, in the unconscious, and that the dream nightly leads us back to this infantile stage. Thus it becomes more certain *that the unconscious in our psychic life is the infantile*. The estranging impression that there is so much evil in man, begins to weaken. This frightful evil is simply the original, primitive, infantile side of psychic life, which we may find in action in children, which we overlook partly because of the slightness of its dimensions, partly because it is lightly considered, since we demand no ethical heights of the child. Since the dream regresses to this stage, it seems to have made apparent the evil that lies in us. But it is only a deceptive appearance by which we have allowed ourselves to be frightened. We are not so evil as we might suspect from the interpretation of dreams.

If the evil impulses of the dream are merely infantilism, a return to the beginnings of our ethical development, since the dream simply makes children of us again in thinking and in feeling, we need not be ashamed of these evil dreams if we are reasonable. But being reasonable is only a part of psychic life. Many things are taking place there that are not reasonable, and so it happens that we are ashamed of such dreams, and unreasonably. We turn them over to the dream-censorship, are ashamed and angry if one of these dreams has in some unusual manner succeeded in penetrating into consciousness in an undistorted form, so that we must recognize it — in fact, we are at times just as ashamed of the distorted dream as we would be if we understood it. Just think of the scandalized opinion of the fine old lady about her uninterpreted dream of "services of love." The problem is not yet solved, and it is still possible that upon further study of the evil in the dream we shall come to some other decision and arrive at another valuation of human nature.

As a result of the whole investigation we grasp two facts, which, however, disclose only the beginnings of new riddles, new doubts. First: the regression of dream-work is not only formal, it is also of greater import. It not only translates our thoughts into a primitive form of expression, but it reawakens the peculiarities of our primitive psychic life, the ancient predominance of the ego, the earliest impulses of our sexual life, even our old intellectual property, if we may consider the symbolic relations as such. And second: We must accredit all these infantilisms which once were governing, and solely governing, to the unconscious, about which our ideas now change and are broadened. Unconscious is no longer a name for what is at that time latent, the unconscious is an especial psychic realm with wish-impulses of its own, with its own method of expression and with a psychic mechanism peculiar to itself, all of which ordinarily are not in force. But the latent dream-thoughts, which we have solved by means of the dream-interpretation, are not of this realm. They are much more nearly the same as any we may have thought in our waking hours. Still they are unconscious; how does one solve this contradiction? We begin to see that a distinction must be made. Something that originates in our conscious life, and that shares its characteristics — we call it the day-remnants — combines in the dream-fabrication with something else out of the realm of the unconscious. Between these two parts the dream-work completes itself. The influencing of the day-remnants by the

unconscious necessitates regression. This is the deepest insight into the nature of the dream that we are able to attain without having searched through further psychic realms. The time will soon come, however, when we shall clothe the unconscious character of the latent dream-thought with another name, which shall differentiate it from the unconscious out of the realm of the infantile.

We may, to be sure, propound the question: what forces the psychological activity during sleep to such regression? Why do not the sleep disturbing psychic stimuli do the job without it? And if they must, because of the dream censorship, disguise themselves through old forms of expression which are no longer comprehensible, what is the use of giving new life to old, long-outgrown psychic stimuli, wishes and character types, that is, why the material regression in addition to the formal? The only satisfactory answer would be this, that only in this manner can a dream be built up, that dynamically the dream-stimulus can be satisfied only in this way. But for the time being we have no right to give such an answer.

FOURTEENTH LECTURE. THE DREAM

Wish Fulfillment

MAY I bring to your attention once more the ground we have already covered? How, when we met with dream distortion in the application of our technique, we decided to leave it alone for the time being, and set out to obtain decisive information about the nature of the dream by way of infantile dreams? How, then, armed with the results of this investigation, we attacked dream distortion directly and, I trust, in some measure overcame it? But we must remind ourselves that the results we found along the one way and along the other do not fit together as well as might be. It is now our task to put these two results together and balance them against one another.

From both sources we have seen that the dream-work consists essentially in the transposition of thoughts into an hallucinatory experience. How that can take place is puzzling enough, but it is a problem of general psychology with which we shall not busy ourselves here. We have learned from the dreams of children that the purpose of the dream-work is the satisfaction of one of the sleep-disturbing psychic stimuli by means of a wish fulfillment. We were unable to make a similar statement concerning distorted dreams, until we knew how to interpret them. But from the very beginning we expected to be able to bring the distorted dreams under the same viewpoint as the infantile. The earliest fulfillment of this expectation led us to believe that as a matter of fact all dreams are the dreams of children and that they all work with infantile materials, through childish psychic stimuli and mechanics. Since we consider that we have conquered dream-distortion, we must continue the investigation to see whether our hypothesis of wish-fulfillment holds good for distorted dreams also.

We very recently subjected a number of dreams to interpretation, but left wish-fulfillment entirely out of consideration. I am convinced that the question again and again occurred to you: “What about wish-fulfillment, which ostensibly is the goal of dream-work?” This question is important. It was, in fact, the question of our lay-critics. As you know, humanity has an instinctive antagonism toward intellectual novelties. The expression of such a novelty should immediately be reduced to its narrowest limits, if

possible, comprised in a commonplace phrase. Wish-fulfillment has become that phrase for the new dream-science. The layman asks: “Where is the wish-fulfillment?” Immediately, upon having heard that the dream is supposed to be a wish-fulfillment, and indeed, by the very asking of the question, he answers it with a denial. He is at once reminded of countless dream-experiences of his own, where his aversion to the dream was enormous, so that the proposition of psychoanalytic dream-science seems very improbable to him. It is a simple matter to answer the layman that wish-fulfillment cannot be apparent in distorted dreams, but must be sought out, so that it is not recognized until the dream is interpreted. We know, too, that the wishes in these distorted dreams are prohibited wishes, are wishes rejected by the censor and that their existence lit the very cause of the dream distortion and the reason for the intrusion of the dream censor. But it is hard to convince the lay-critic that one may not seek the wish-fulfillment in the dream before the dream has been interpreted. This is continually forgotten. His sceptical attitude toward the theory of wish-fulfillment is really nothing more than a consequence of dream-censorship, a substitute and a result of the denial of this censored dream-wish.

To be sure, even we shall find it necessary to explain to ourselves why there are so many dreams of painful content, and especially dreams of fear. We see here, for the first time, the problem of the affects in the dream, a problem worthy of separate investigation, but which unfortunately cannot be considered here. If the dream is a wish-fulfillment, painful experiences ought to be impossible in the dream; in that the lay-critics apparently are right. But three complications, not thought of by them, must be taken into consideration.

First: It may be that the dream work has not been successful in creating a wish-fulfillment, so that a part of the painful effect of the dream-thought is left over for the manifest dream. Analysis should then show that these thoughts were far more painful even than the dream which was built out of them. This much may be proved in each instance. We admit, then, that the dream work has not achieved its purpose any more than the drink-dream due to the thirst-stimulus has achieved its purpose of satisfying the thirst. One remains thirsty, and must wake up in order to drink. But it was a real dream, it sacrificed nothing of its nature. We must say: “Although strength be lacking, let us praise the will to do.” The clearly recognizable intention,

at least, remains praiseworthy. Such cases of miscarriage are not unusual. A contributory cause is this, that it is so much more difficult for the dream work to change affect into content in its own sense; the affects often show great resistance, and thus it happens that the dream work has worked the painful content of the dream-thoughts over into a wish-fulfillment, while the painful affect continues in its unaltered form. Hence in dreams of this type the affect does not fit the content at all, and our critics may say the dream is so little a wish-fulfillment that a harmless content may be experienced as painful. In answer to this unintelligible remark we say that the wish-fulfillment tendency in the dream-work appears most prominent, because isolated, in just such dreams. The error is due to the fact that he who does not know neurotics imagines the connection between content and affect as all too intimate, and cannot, therefore, grasp the fact that a content may be altered without any corresponding change in the accompanying affect-expression.

A second, far more important and more extensive consideration, equally disregarded by the layman, is the following: A wish-fulfillment certainly must bring pleasure — but to whom? Naturally, to him who has the wish. But we know from the dreamer that he stands in a very special relationship to his wishes. He casts them aside, censors them, he will have none of them. Their fulfillment gives him no pleasure, but only the opposite. Experience then shows that this opposite, which must still be explained, appears in the form of fear. The dreamer in his relation to his dream-wishes can be compared only to a combination of two persons bound together by some strong common quality. Instead of further explanations I shall give you a well-known fairy tale, in which you will again find the relationships I have mentioned. A good fairy promises a poor couple, husband and wife, to fulfill their first three wishes. They are overjoyed, and determine to choose their three wishes with great care. But the woman allows herself to be led astray by the odor of cooking sausages emanating from the next cottage, and wishes she had a couple of such sausages. Presto! they are there. This is the first wish-fulfillment. Now the husband becomes angry, and in his bitterness wishes that the sausages might hang from the end of her nose. This, too, is accomplished, and the sausages cannot be removed from their new location. So this is the second wish-fulfillment, but the wish is that of the husband. The wife is very uncomfortable because of the fulfillment of this wish. You know how the

fairy tale continues. Since both husband and wife are fundamentally one, the third wish must be that the sausages be removed from the nose of the wife. We could make use of this fairy tale any number of times in various connections; here it serves only as an illustration of the possibility that the wish-fulfillment for the one personality may lead to an aversion on the part of the other, if the two do not agree with one another.

It will not be difficult now to come to a better understanding of the anxiety-dream. We shall make one more observation, then we shall come to a conclusion to which many things lead. The observation is that the anxiety dreams often have a content which is entirely free from distortion and in which the censorship is, so to speak, eluded. The anxiety dream is ofttimes an undisguised wish-fulfillment, not, to be sure, of an accepted, but of a discarded wish. The anxiety development has stepped into the place of the censorship. While one may assert of the infantile dream that it is the obvious fulfillment of a wish that has gained admittance, and of the distorted dream that it is the disguised fulfillment of a suppressed wish, he must say of the anxiety dream that the only suitable formula is this, that it is the obvious fulfillment of a suppressed wish. Anxiety is the mark which shows that the suppressed wish showed itself stronger than the censorship, that it put through its wish-fulfillment despite the censorship, or was about to put it through. We understand that what is wish-fulfillment for the suppressed wish is for us, who are on the side of the dream-censor, only a painful sensation and a cause for antagonism. The anxiety which occurs in dreams is, if you wish, anxiety because of the strength of these otherwise suppressed wishes. Why this antagonism arises in the form of anxiety cannot be discovered from a study of the dream alone; one must obviously study anxiety from other sources.

What holds true for the undistorted anxiety dream we may assume to be true also of those dreams which have undergone partial distortion, and of the other dreams of aversion whose painful impressions very probably denote approximations of anxiety. The anxiety dream is usually also a dream that causes waking; we habitually interrupt sleep before the suppressed wish of the dream has accomplished its entire fulfillment in opposition to the censorship. In this case the execution of the dream is unsuccessful, but this does not change its nature. We have likened the dream to the night watchman or sleep-defender who wishes to protect our sleep from being disturbed. The night watchman, too, sometimes wakes

the sleeper when he feels himself too weak to drive away the disturbance or danger all by himself. Yet we are often able to remain asleep, even when the dream begins to become suspicious, and begins to assume the form of anxiety. We say to ourselves in our sleep: “It’s only a dream,” and we sleep on.

When does it happen that the dream-wish is in a position to overpower this censorship? The conditions for this may be just as easily furnished by the dream-wish as by the dream-censorship. The wish may, for unknown reasons, become irresistible; but one gets the impression that more frequently the attitude of the dream censorship is to blame for this disarrangement in the relations of the forces. We have already heard that the censorship works with varying intensity in each single instance, that it handles each element with a different degree of strictness; now we should like to add the proposition that it is an extremely variable thing and does not exert equal force on every occasion against the same objectionable element. If on occasion the censorship feels itself powerless with respect to a dream-wish which threatens to over-ride it, then, instead of distortion, it makes use of the final means at its disposal, it destroys the sleep condition by the development of anxiety.

And now it occurs to us that we know absolutely nothing yet as to why these evil, depraved wishes are aroused just at night, in order that they may disturb our sleep. The answer can only be an assumption which is based on the nature of the condition of sleep. During the day the heavy pressure of a censorship weighs upon these wishes, making it impossible, as a rule, for them to express themselves in any manner. At night, evidently, this censorship is withdrawn for the benefit of the single sleep-wish, in the same manner as are all the other interests of psychic life, or at least placed in a position of very minor importance. The forbidden wishes must thank this noctural deposition of the censor for being able to raise their heads again. There are nervous persons troubled with insomnia who admit that their sleeplessness was in the beginning voluntary. They did not trust themselves to fall asleep, because they were afraid of their dreams, that is, of the results due to a slackening of the censorship. So you can readily see that this withdrawal of the censor does not in itself signify rank carelessness. Sleep weakens our power to move; our evil intentions, even if they do begin to stir, can accomplish nothing but a dream, which for practical purposes is harmless, and the highly sensible remark of the

sleepers, a night-time remark indeed, but not a part of the dream life, “it is only a dream,” is reminiscent of this quieting circumstance. So let us grant this, and sleep on.

If, thirdly, you recall the concept that the dreamer, struggling against his wishes, is to be compared to a summation of two separate persons, in some manner closely connected, you will be able to grasp the further possibility of how a thing which is highly unpleasant, namely, punishment, may be accomplished by wish-fulfillment. Here again the fairy tale of the three wishes can be of service to us: the sausages on the plate are the direct wish-fulfillment of the first person, the woman; the sausages at the end of her nose are the wish-fulfillment of the second person, the husband, but at the same time the punishment for the stupid wish of the woman. Among the neurotics we find again the motivation of the third wish, which remains in fairy tales only. There are many such punishment-tendencies in the psychic life of man; they are very powerful, and we may make them responsible for some of our painful dreams. Perhaps you now say that at this rate, not very much of the famed wish-fulfillment is left. But upon closer view you will admit that you are wrong. In contrast to the many-sided to be discussed, of what the dream might be — and, according to numerous authors, is — the solution (wish-fulfillment, anxiety-fulfillment, punishment-fulfillment) is indeed very restricted. That is why anxiety is the direct antithesis of the wish, why antitheses are so closely allied in association and why they occur together in the unconscious, as we have heard; and that is why punishment, too, is a wish-fulfillment of the other, the censoring person.

On the whole, then, I have made no concessions to your protestation against the theory of wish-fulfillment. We are bound, however, to establish wish-fulfillment in every dream no matter how distorted, and we certainly do not wish to withdraw from this task. Let us go back to the dream, already interpreted, of the three bad theatre tickets for 1 Fl. 50 Kr. from which we have already learned so much. I hope you still remember it. A lady who tells her husband during the day that her friend Elise, only three months younger than herself, has become engaged, dreams she is in the theatre with her husband. Half the parquet is empty. Her husband says, “Elise and her fiancé wanted to go to the theatre, too, but couldn’t because they could get only poor seats, three for one gulden and a half.” She was of the opinion that that wasn’t so unfortunate. We discovered that the dream-

thought originated in her discontent at having married too soon, and the fact that she was dissatisfied with her husband. We may be curious as to the manner in which these thoughts have been worked over into a wish-fulfillment, and where their traces may be found in the manifest content. Now we know that the element “too soon, premature” is eliminated from the dream by the censor. The empty parquet is a reference to it. The puzzling “three for 1 Fl. 50 Kr.” is now, with the help of symbolism which we have since learned, more understandable. The “3” really means a husband, and the manifest element is easy to translate: to buy a husband for her dowry (“I could have bought one ten times better for my dowry”). The marriage is obviously replaced by going into the theatre. “Buying the tickets too soon” directly takes the place of the premature marriage. This substitution is the work of the wish-fulfillment. Our dreamer was not always so dissatisfied with her early marriage as she was on the day she received news of the engagement of her friend. At the time she was proud of her marriage and felt herself more favored than her friend. Naive girls have frequently confided to their friends after their engagement that soon they, too, will be able to go to all the plays hitherto forbidden, and see everything. The desire to see plays, the curiosity that makes its appearance here, was certainly in the beginning directed towards sex matters, the sex-life, especially the sex-life of the parents, and then became a strong motive which impelled the girl to an early marriage. In this way the visit to the theatre becomes an obvious representative substitute for being married. In the momentary annoyance at her early marriage she recalls the time when the early marriage was a wish-fulfillment for her, because she had satisfied her curiosity; and she now replaces the marriage, guided by the old wish-impulse, with the going to the theatre.

We may say that we have not sought out the simplest example as proof of a hidden wish-fulfillment. We would have to proceed in analogous manner with other distorted dreams. I cannot do that for you, and simply wish to express the conviction that it will be successful everywhere. But I wish to continue along this theoretical line. Experience has taught me that it is one of the most dangerous phases of the entire dream science, and that many contradictions and misunderstandings are connected therewith. Besides, you are perhaps still under the impression that I have retracted a part of my declaration, in that I said that the dream is a fulfilled wish or its opposite, an actualized anxiety or punishment, and you will think this is

the opportunity to compel further reservations of me. I have also heard complaints that I am too abrupt about things which appear evident to me, and that for that reason I do not present the thing convincingly enough.

If a person has gone thus far with us in dream-interpretation, and accepted everything that has been offered, it is not unusual for him to call a halt at wish-fulfillment, and say, “Granted that in every instance the dream has a meaning, and that this meaning can be disclosed by psychoanalytic technique, why must this dream, despite all evidence to the contrary, always be forced into the formula of wish-fulfillment? Why might not the meaning of this nocturnal thought be as many-sided as thought is by day; why may not the dream in one case express a fulfilled wish, in another, as you yourself say, the opposite thereof, an actualized anxiety; or why may it not correspond to a resolution, a warning, a reflection with its pro’s and con’s, a reproach, a goad to conscience, an attempt to prepare oneself for a contemplated performance, etc? Why always nothing more than a wish, or at best, its opposite?”

One might maintain that a difference of opinion on these points is of no great importance, so long as we are at one otherwise. We might say that it is enough to have discovered the meaning of the dream, and the way to recognize it; that it is a matter of no importance, if we have too narrowly limited this meaning. But this is not so. A misunderstanding of this point strikes at the nature of our knowledge of the dream, and endangers its worth for the understanding of neuroses. Then, too, that method of approach which is esteemed in the business world as genteel is out of place in scientific endeavors, and harmful.

My first answer to the question why the dream may not be many-sided in its meaning is the usual one in such instances: I do not know why it should not be so. I would not be opposed to such a state of affairs. As far as I am concerned, it could well be true. Only one small matter prevents this broader and more comfortable explanation of the dream — namely, that as a matter of fact it isn’t so. My second answer emphasizes the fact that the assumption that the dream corresponds to numerous forms of thought and intellectual operations is no stranger to me. In a story about a sick person I once reported a dream that occurred three nights running and then stopped, and I explained this suppression by saying that the dream corresponded to a resolution which had no reason to recur after having been carried out. More recently I published a dream which corresponded

to a confession. How is it possible for me to contradict myself, and maintain that the dream is always only a fulfilled wish?

I do that, because I do not wish to admit a stupid misunderstanding which might cost us the fruits of all our labors with regard to the dream, a misunderstanding which confuses the dream with the latent dream-thought and affirms of the dream something that applies specifically and solely to the latter. For it is entirely correct that the dream can represent, and be replaced by all those things we enumerated: a resolution, a warning, reflection, preparation, an attempt to solve a problem, etc. But if you look closely, you will recognize that all these things are true only of the latent dream thoughts, which have been changed about in the dream. You learn from the interpretation of the dreams that the person's unconscious thinking is occupied with such resolutions, preparations, reflections, etc., out of which the dream-work then builds the dream. If you are not at the time interested in the dream-work, but are very much interested in the unconscious thought-work of man, you eliminate the dream-work, and say of the dream, for all practical purposes quite correctly, that it corresponds to a warning, a resolution, etc. This often happens in psychoanalytic activity. People endeavor for the most part only to destroy the dream form, and to substitute in its place in the sequence the latent thoughts out of which the dream was made.

Thus we learn, from the appreciation of the latent dream-thoughts, that all the highly complicated psychic acts we have enumerated can go on unconsciously, a result as wonderful as it is confusing.

But to return, you are right only if you admit that you have made use of an abbreviated form of speech, and if you do not believe that you must connect the many-sidedness we have mentioned with the essence of the dream. When you speak of the dream you must mean either the manifest dream, i.e., the product of the dream-work, or at most the dream-work itself — that psychic occurrence which forms the manifest dream out of the latent dream thought. Any other use of the word is a confusion of concept that can only cause trouble. If your assertions refer to the latent thoughts back of the dream, say so, and do not cloud the problem of the dream by using such a faulty means of expression. The latent dream thoughts are the material which the dream-work remolds into the manifest dream. Why do you insist upon confusing the material with the work that makes use of it? Are you any better off than those who knew only the

product of this work, and could explain neither where it came from nor how it was produced?

The only essential thing in the dream is the dream-work that has had its influence upon the thought-material. We have no right to disregard it theoretically even if, in certain practical situations, we may fail to take it into account. Analytic observation, too, shows that the dream-work never limits itself to translating these thoughts in the archaic or regressive mode of expression known to you. Rather it regularly adds something which does not belong to the latent thoughts of waking, but which is the essential motive of dream-formation. This indispensable ingredient is at the same time the unconscious wish, for the fulfillment of which the dream content is rebuilt. The dream may be any conceivable thing, if you take into account only the thoughts represented by it, warning, resolution, preparation, etc.; it is also always the fulfillment of an unknown wish, and it is this only if you look upon it as the result of the dream-work. A dream is never itself a resolution, a warning, and no more — but always a resolution, etc., translated into an archaic form of expression with the help of the unconscious wish, and changed about for the purpose of fulfilling this wish. The one characteristic, wish-fulfillment, is constant; the other may vary; it may itself be a wish at times, so that the dream, with the aid of an unconscious wish, presents as fulfilled a latent wish out of waking hours.

I understand all this very well, but I do not know whether or not I shall be successful in making you understand it as well. I have difficulties, too, in proving it to you. This cannot be done without, on the one hand, careful analysis of many dreams, and on the other hand this most difficult and most important point of our conception of the dream cannot be set forth convincingly without reference to things to follow. Can you, in fact, believe that taking into consideration the intimate relationship of all things, one is able to penetrate deeply into the nature of one thing without having carefully considered other things of a very similar nature? Since we know nothing as yet about the closest relatives of the dream, neurotic symptoms, we must once again content ourselves with what has already been accomplished. I want to explain one more example to you, and propose a new viewpoint.

Let us again take up that dream to which we have several times recurred, the dream of the three theatre tickets for 1 Fl. 50 Kr. I can assure

you that I took this example quite unpremeditatedly at first. You are acquainted with the latent dream thoughts: annoyance, upon hearing that her friend had just now become engaged, at the thought that she herself had hurried so to be married; contempt for her husband; the idea that she might have had a better one had she waited. We also know the wish, which made a dream out of these thoughts — it is “curiosity to see,” being permitted to go to the theatre, very likely a derivation from the old curiosity finally to know just what happens when one is married. This curiosity, as is well known, regularly directs itself in the case of children to the sex-life of the parents. It is an impulse of childhood, and in so far as it persists later, an impulse whose roots reach back into the infantile. But that day’s news played no part in awaking the curiosity, it awoke only annoyance and regret. This wish impulse did not have anything to do immediately with the latent dream thoughts, and we could fit the result of the dream interpretation into the analysis without considering the wish impulse at all. But then, the annoyance itself was not capable of producing the dream; a dream could not be derived from the thought: “It was stupid to marry so soon,” except by reviving the old wish finally to see what happens when one is married. The wish then formed the dream content, in that it replaced marriage by going to the theatre, and gave it the form of an earlier wish-fulfillment: “so now I may go to the theatre and see all the forbidden things, and you may not. I am married and you must wait.” In such a manner the present situation was transposed into its opposite, an old triumph put into the place of the recent defeat. Added thereto was a satisfied curiosity amalgamated with a satisfied egoistic sense of rivalry. This satisfaction determines the manifest dream content in which she really is sitting in the theatre, and her friend was unable to get tickets. Those bits of dream content are affixed to this satisfaction situation as unfitting and inexplicable modifications, behind which the latent dream thoughts still hide. Dream interpretation must take into consideration everything that serves toward the representation of the wish-fulfillment and must reconstruct from these suggestions the painful latent dream-thought.

The observation I now wish to make is for the purpose of drawing your attention to the latent, dream thoughts, now pushed to the fore. I beg of you not to forget first, that the dreamer is unconscious of them, second, they are entirely logical and continuous, so that they may be understood as

a comprehensible reaction to the dream occasion, third, that they may have the value of any desired psychic impulse or intellectual operation. I shall now designate these thoughts more forcibly than before as “day-remnants”; the dreamer may acknowledge them or not. I now separate day-remnants and latent dream thoughts in accordance with our previous usage of calling everything that we discover in interpreting the dream “latent dream thoughts,” while the day-remnants are only a part of the latent dream thoughts. Then our conception goes to show that something additional has been added to the day-remnants, something which also belonged to the unconscious, a strong but suppressed wish impulse, and it is this alone that has made possible the dream fabrication. The influence of this wish impulse on the day-remnants creates the further participation of the latent dream thoughts, thoughts which no longer appear rational and understandable in relation to waking life.

In explaining the relationship of the day-remnants to the unconscious wish I have made use of a comparison which I can only repeat here. Every undertaking requires a capitalist, who defrays the expenses, and an entrepreneur, who has the idea and understands how to carry it out. The role of the capitalist in the dream fabrication is always played by the unconscious wish; it dispenses the psychic energy for dream-building. The actual worker is the day-remnant, which determines how the expenditure is to be made. Now the capitalist may himself have the idea and the particularized knowledge, or the entrepreneur may have the capital. This simplifies the practical situation, but makes its theoretical comprehension more difficult. In economics we always distinguish between the capitalist and the entrepreneur aspect in a single person, and thus we reconstruct the fundamental situation which was the point of departure for our comparison. In dream-fabrication the same variations occur. I shall leave their further development to you.

We can go no further here, for you have probably long been disturbed by a reflection which deserves to be heard. Are the day-remnants, you ask, really unconscious in the same sense as the unconscious wish which is essential to making them suitable for the dream? You discern correctly. Here lies the salient point of the whole affair. They are not unconscious in the same sense. The dream wish belongs to a different unconsciousness, that which we have recognized as of infantile origin, fitted out with special mechanisms. It is entirely appropriate to separate these two types of

unconsciousness and give them different designations. But let us rather wait until we have become acquainted with the field of neurotic symptoms. If people say one unconsciousness is fantastic, what will they say when we acknowledge that we arrived at our conclusions by using two kinds of unconsciousness?

Let us stop here. Once more you have heard something incomplete; but is there not hope in the thought that this science has a continuation which will be brought to light either by ourselves or by those to follow? And have not we ourselves discovered a sufficient number of new and surprising things?

FIFTEENTH LECTURE. THE DREAM

Doubtful Points and Criticism

LET us not leave the subject of dreams before we have touched upon the most common doubts and uncertainties which have arisen in connection with the new ideas and conceptions we have discussed up to this point. The more attentive members of the audience probably have already accumulated some material bearing upon this.

1. You may have received the impression that the results of our work of interpretation of the dream have left so much that is uncertain, despite our close adherence to technique, that a true translation of the manifest dream into the latent dream thoughts is thereby rendered impossible. In support of this you will point out that in the first place, one never knows whether a specific element of the dream is to be taken literally or symbolically, since those elements which are used symbolically do not, because of that fact, cease to be themselves. But if one has no objective standard by which to decide this, the interpretation is, as to this point, left to the discretion of the dream interpreter. Moreover, because of the way in which the dream work combines opposites, it is always uncertain whether a specific dream element is to be taken in the positive or the negative sense, whether it is to be understood as itself or as its opposite. Hence this is another opportunity for the exercise of the interpreter's discretion. In the third place, in consequence of the frequency with which every sort of inversion is practised in the dream, the dream interpreter is at liberty to assume such an inversion at any point of the dream he pleases. And finally you will say, you have heard that one is seldom sure that the interpretation which is found is the only possible one. There is danger of overlooking a thoroughly admissible second interpretation of the same dream. Under these circumstances, you will conclude there is a scope left for the discretion of the interpreter, the breadth of which seems incompatible with the objective accuracy of the results. Or you may also conclude that the fault does not rest with the dream but that the inadequacies of our dream interpretation result from errors in our conceptions and hypotheses.

All your material is irreproachable, but I do not believe that it justifies your conclusions in two directions, namely, that dream interpretation as we practice it is sacrificed to arbitrariness and that the deficiency of our

results makes the justification of our method doubtful. If you will substitute for the arbitrariness of the interpreter, his skill, his experience, his comprehension, I agree with you. We shall surely not be able to dispense with some such personal factor, particularly not in difficult tasks of dream interpretation. But this same state of affairs exists also in other scientific occupations. There is no way in which to make sure that one man will not wield a technique less well, or utilize it more fully, than another. What might, for example, impress you as arbitrariness in the interpretation of symbols, is compensated for by the fact that as a rule the connection of the dream thoughts among themselves, the connection of the dream with the life of the dreamer, and the whole psychic situation in which the dream occurs, chooses just one of the possible interpretations advanced and rejects the others as useless for its purposes. The conclusion drawn from the inadequacies of dream interpretation, that our hypotheses are wrong, is weakened by an observation which shows that the ambiguity and indefiniteness of the dream is rather characteristic and necessarily to be expected.

Recollect that we said that the dream work translates the dream thoughts into primitive expressions analogous to picture writing. All these primitive systems of expression are, however, subject to such indefiniteness and ambiguities, but it does not follow that we are justified in doubting their usefulness. You know that the fusion of opposites by the dream-work is analogous to the so-called “antithetical meaning of primitive words,” in the oldest languages. The philologist, R. Abel (1884), whom we have to thank for this point of view, admonishes us not to believe that the meaning of the communication which one person made to another when using such ambiguous words was necessarily unclear. Tone and gesture used in connection with the words would have left no room for doubt as to which of the two opposites the speaker intended to communicate. In writing, where gesture is lacking, it was replaced by a supplementary picture sign not intended to be spoken, as for example by the picture of a little man squatting lazily or standing erect, according to whether the ambiguous hieroglyphic was to mean “weak” or “strong.” It was in this way that one avoided any misunderstanding despite the ambiguity of the sounds and signs.

We recognize in the ancient systems of expression, e.g., the writings of those oldest languages, a number of uncertainties which we would not

tolerate in our present-day writings. Thus in many Semitic writings only the consonants of words are indicated. The reader had to supply the omitted vowels according to his knowledge and the context. Hieroglyphic writing does not proceed in exactly this way, but quite similarly, and that is why the pronunciation of old Egyptian has remained unknown to us. The holy writings of the Egyptians contain still other uncertainties. For example, it is left to the discretion of the writer whether or not he shall arrange the pictures from right to left or from left to right. To be able to read we have to follow the rule that we must depend upon the faces of the figures, birds, and the like. The writer, however, could also arrange the picture signs in vertical rows, and in inscriptions on small objects he was guided by considerations of beauty and proportion further to change the order of the signs. Probably the most confusing feature of hieroglyphic writing is to be found in the fact that there is no space between words. The pictures stretch over the page at uniform distances from one another, and generally one does not know whether a sign belongs to what has gone before or is the beginning of a new word. Persian cuneiform writing, on the other hand, makes use of an oblique wedge sign to separate the words.

The Chinese tongue and script is exceedingly old, but still used by four hundred million people. Please do not think I understand anything about it. I have only informed myself concerning it because I hoped to find analogies to the indefinite aspects of the dream. Nor was I disappointed. The Chinese language is filled with so many vagaries that it strikes terror into our hearts. It consists, as is well known, of a number of syllable sounds which are spoken singly or are combined in twos. One of the chief dialects has about four hundred such sounds. Now since the vocabulary of this dialect is estimated at about four thousand words, it follows that every sound has on an average of ten different meanings, some less but others, consequently, more. Hence there are a great number of ways of avoiding a multiplicity of meaning, since one cannot guess from the context alone which of the ten meanings of the syllable sound the speaker intended to convey to the hearer. Among them are the combining of two sounds into a compounded word and the use of four different “tones” with which to utter these syllables. For our purposes of comparison, it is still more interesting to note that this language has practically no grammar. It is impossible to say of a one-syllable word whether it is a noun, a verb, or an adjective, and we find none of those changes in the forms of the words by means of

which we might recognize sex, number, ending, tense or mood. The language, therefore, might be said to consist of raw material, much in the same manner as our thought language is broken up by the dream work into its raw materials when the expressions of relationship are left out. In the Chinese, in all cases of vagueness the decision is left to the understanding of the hearer, who is guided by the context. I have secured an example of a Chinese saying which, literally translated, reads: “Little to be seen, much to wonder at.” That is not difficult to understand. It may mean, “The less a man has seen, the more he finds to wonder at,” or, “There is much to admire for the man who has seen little.” Naturally, there is no need to choose between these two translations, which differ only in grammar. Despite these uncertainties, we are assured, the Chinese language is an extraordinarily excellent medium for the expression of thought. Vagueness does not, therefore, necessarily lead to ambiguity.

Now we must certainly admit that the condition of affairs is far less favorable in the expression-system of the dream than in these ancient languages and writings. For, after all, these latter are really designed for communication, that is to say, they were always intended to be understood, no matter in what way and with what aids. But it is just this characteristic which the dream lacks. The dream does not want to tell anyone anything, it is no vehicle of communication, it is, on the contrary, constructed so as not to be understood. For that reason we must not be surprised or misled if we should discover that a number of the ambiguities and vagaries of the dream do not permit of determination. As the one specific gain of our comparison, we have only the realization that such uncertainties as people tried to make use of in objecting to the validity of our dream interpretation, are rather the invariable characteristic of all primitive systems of expression.

How far the dream can really be understood can be determined only by practice and experience. My opinion is, that that is very far indeed, and the comparison of results which correctly trained analysts have gathered confirms my view. The lay public, even that part of the lay public which is interested in science, likes, in the face of the difficulties and uncertainties of a scientific task, to make what I consider an unjust show of its superior scepticism. Perhaps not all of you are acquainted with the fact that a similar situation arose in the history of the deciphering of the Babylonian-Assyrian inscriptions. There was a period then when public opinion went

far in declaring the decipherors of cuneiform writing to be visionaries and the whole research a “fraud.” But in the year 1857 the Royal Asiatic Society made a decisive test. It challenged the four most distinguished decipherors of cuneiform writing, Rawlinson, Hincks, Fox Talbot and Oppert, each to send to it in a sealed envelope his independent translation of a newly discovered inscription, and the Society was then able to testify, after having made a comparison of the four readings, that their agreement was sufficiently marked to justify confidence in what already had been accomplished, and faith in further progress. At this the mockery of the learned lay world gradually came to an end and the confidence in the reading of cuneiform documents has grown appreciably since then.

2. A second series of objections is firmly grounded in the impression from which you too probably are not free, that a number of the solutions of dream interpretations which we find it necessary to make seem forced, artificial, far-fetched, in other words, violent or even comical or jocose. These comments are so frequent that I shall choose at random the latest example which has come to my attention. Recently, in free Switzerland, the director of a boarding-school was relieved of his position on account of his active interest in psychoanalysis. He raised objections and a Berne newspaper made public the judgment of the school authorities. I quote from that article some sentences which apply to psychoanalysis: “Moreover, we are surprised at the many far-fetched and artificial examples as found in the aforementioned book of Dr. Pfister of Zurich.... Thus, it certainly is a cause of surprise when the director of a boarding-school so uncritically accepts all these assertions and apparent proofs.” These observations are offered as the decisions of “one who judges calmly.” I rather think this calm is “artificial.” Let us examine these remarks more closely in the hope that a little reflection and knowledge of the subject can be no detriment to calm judgment.

It is positively refreshing to see how quickly and unerringly some individuals can judge a delicate question of abstruse psychology by first impressions. The interpretations seem to them far-fetched and forced, they do not please them, so the interpretations are wrong and the whole business of interpretation amounts to nothing. No fleeting thought ever brushes the other possibility, that these interpretations must appear as they are for good reasons, which would give rise to the further question of what these good reasons might be.

The content thus judged generally relates to the results of displacement, with which you have become acquainted as the strongest device of the dream censor. It is with the help of displacements that the dream censor creates substitute-formations which we have designated as allusions. But they are allusions which are not easily recognized as such, and from which it is not easy to find one's way back to the original and which are connected with this original by means of the strangest, most unusual, most superficial associations. In all of these cases, however, it is a question of matters which are to be hidden, which were intended for concealment; this is what the dream censor aims to do. We must not expect to find a thing that has been concealed in its accustomed place in the spot where it belongs. In this respect the Commissions for the Surveillance of Frontiers now in office are more cunning than the Swiss school authorities. In their search for documents and maps they are not content to search through portfolios and letter cases but they also take into account the possibility that spies and smugglers might carry such severely proscribed articles in the most concealed parts of their clothing, where they certainly do not belong, as for example between the double soles of their boots. If the concealed objects are found in such a place, they certainly are very far-fetched, but nevertheless they have been "fetched."

If we recognize that the most remote, the most extraordinary associations between the latent dream element and its manifest substitute are possible, associations appearing ofttimes comical, ofttimes witty, we follow in so doing a wealth of experience derived from examples whose solutions we have, as a rule, not found ourselves. Often it is not possible to give such interpretations from our own examples. No sane person could guess the requisite association. The dreamer either gives us the translation with one stroke by means of his immediate association — he can do this, for this substitute formation was created by his mind — or he provides us with so much material that the solution no longer demands any special astuteness but forces itself upon us as inevitable. If the dreamer does not help us in either of these two ways, then indeed the manifest element in question remains forever incomprehensible to us. Allow me to give you one more such example of recent occurrence. One of my patients lost her father during the time that she was undergoing treatment. Since then she has made use of every opportunity to bring him back to life in her dreams. In one of her dreams her father appears in a certain connection, of no

further importance here, and says, "*It is a quarter past eleven, it is half past eleven, it is quarter of twelve*." All she can think of in connection with this curious incident is the recollection that her father liked to see his grown-up children appear punctually at the general meal hour. That very thing probably had some connection with the dream element, but permitted of no conclusion as to its source. Judging from the situation of the treatment at that time, there was a justified suspicion that a carefully suppressed critical rebellion against her loved and respected father played its part in this dream. Continuing her associations, and apparently far afield from topics relevant to the dream, the dreamer relates that yesterday many things of a psychological nature had been discussed in her presence, and that a relative made the remark: "The cave man (*Urmensch*) continues to live in all of us." Now we think we understand. That gave her an excellent opportunity of picturing her father as continuing to live. So in the dream she made of him a clockman (*Uhrmensch*) by having him announce the quarter-hours at noon time.

You may not be able to disregard the similarity which this examples bears to a pun, and it really has happened frequently that the dreamer's pun is attributed to the interpreter. There are still other examples in which it is not at all easy to decide whether one is dealing with a joke or a dream. But you will recall that the same doubt confronted us when we were dealing with slips of the tongue. A man tells us a dream of his, that his uncle, while they were sitting in the latter's *auto*mobile, gave him a kiss. He very quickly supplies the interpretation himself. It means "*auto*-eroticism," (a term taken from the study of the libido, or love impulse, and designating satisfaction of that impulse without an external object). Did this man permit himself to make fun of us and give out as a dream a pun that occurred to him? I do not believe so; he really dreamed it. Whence comes the astounding similarity? This question at one time led me quite a ways from my path, by making it necessary for me to make a thorough investigation of the problem of humor itself. By so doing I came to the conclusion that the origin of wit lies in a foreconscious train of thought which is left for a moment to unconscious manipulation, from which it then emerges as a joke. Under the influence of the unconscious it experiences the workings of the mechanisms there in force, namely, of condensation and displacement, that is, of the same processes which we found active in the dream work, and it is to this agreement that we are to

ascribe the similarity between wit and the dream, wherever it occurs. The unintentional “dream joke” has, however, none of the pleasure-giving quality of the ordinary joke. Why that is so, greater penetration into the study of wit may teach you. The “dream joke” seems a poor joke to us, it does not make us laugh, it leaves us cold.

Here we are also following in the footsteps of ancient dream interpretation, which has left us, in addition to much that is useless, many a good example of dream interpretation we ourselves cannot surpass. I am now going to tell you a dream of historical importance which Plutarch and Artemidorus of Daldis both tell concerning Alexander the Great, with certain variations. When the King was engaged in besieging the city of Tyre (322 B.C.), which was being stubbornly defended, he once dreamed that he saw a dancing satyr. Aristandros, his dream interpreter, who accompanied the army, interpreted this dream for him by making of the word *Satyros*, σὰ Τύρος, “Thine is Tyre,” and thus promising him a triumph over the city. Alexander allowed himself to be influenced by this interpretation to continue the siege, and finally captured Tyre. The interpretation, which seems artificial enough, was without doubt the correct one.

3. I can imagine that it will make a special impression on you to hear that objections to our conception of the dream have been raised also by persons who, as psychoanalysts, have themselves been interested in the interpretation of dreams. It would have been too extraordinary if so pregnant an opportunity for new errors had remained unutilized, and thus, owing to comprehensible confusions and unjustified generalizations, there have been assertions made which, in point of incorrectness are not far behind the medical conception of dreams. One of these you already know. It is the declaration that the dream is occupied with the dreamer’s attempts at adaptation to his present environment, and attempts to solve future problems, in other words, that the dream follows a “prospective tendency” (A. Maeder). We have already shown that this assertion is based upon a confusion of the dream with the latent thoughts of the dream, that as a premise it overlooks the existence of the dream-work. In characterizing that psychic activity which is unconscious and to which the latent thoughts of the dream belong, the above assertion is no novelty, nor is it exhaustive, for this unconscious psychic activity occupies itself with many other things besides preparation for the future. A much worse confusion seems

to underlie the assurance that back of every dream one finds the “death-clause,” or death-wish. I am not quite certain what this formula is meant to indicate, but I suppose that back of it is a confusion of the dream with the whole personality of the dreamer.

An unjustified generalization, based on few good examples, is the pronouncement that every dream permits of two interpretations, one such as we have explained, the so-called psychoanalytic, and another, the so-called anagogical or mystical, which ignores the instinctive impulses and aims at a representation of the higher psychic functions (V. Silberer). There are such dreams, but you will try in vain to extend this conception to even a majority of the dreams. But after everything you have heard, the statement will seem very incomprehensible that all dreams can be interpreted bisexually, that is, as the concurrence of two tendencies which may be designated as male and female (A. Adler). To be sure, there are a few such dreams, and you may learn later that these are built up in the manner of certain hysterical symptoms. I mention all these newly discovered general characteristics of the dream in order to warn you against them or at least in order not to leave you in doubt as to how I judge them.

4. At one time the objective value of dream research was called into question by the observation that patients undergoing analysis accommodate the content of their dreams to the favorite theories of their physicians, so that some dream predominantly of sexual impulses, others of the desire for power and still others even of rebirth (W. Stekel). The weight of this observation is diminished by the consideration that people dreamed before there was such a thing as a psychoanalytic treatment to influence their dreams, and that those who are now undergoing treatment were also in the habit of dreaming before the treatment was commenced. The meaning of this novel discovery can soon be recognized as a matter of course and as of no consequence for the theory of the dream. Those day-remnants which give rise to the dream are the overflow from the strong interest of the waking life. If the remarks of the physician and the stimuli which he gives have become significant to the patient under analysis, then they become a part of the day’s remnants, can serve as psychic stimuli for the formation of a dream along with other, emotionally-charged, unsolved interests of the day, and operate much as do the somatic stimuli which act upon the sleeper during his sleep. Just like these other incitors of the

dream, the sequence of ideas which the physician sets in motion may appear in the manifest content, or may be traced in the latent content of the dream. Indeed, we know that one can produce dreams experimentally, or to speak more accurately, one can insert into the dream a part of the dream material. Thus the analyst in influencing his patients, merely plays the role of an experimenter in the manner of Mourly Vold, who places the limbs of his subjects in certain positions.

One can often influence the dreamer as to the *subject-matter* of his dream, but one can never influence *what he will dream* about it. The mechanism of the dream-work and the unconscious wish that is hidden in the dream are beyond the reach of all foreign influences. We already realized, when we evaluated the dreams caused by bodily stimuli, that the peculiarity and self-sufficiency of the dream life shows itself in the reaction with which the dream retorts to the bodily or physical stimuli which are presented. The statement here discussed, which aims to throw doubt upon the objectivity of dream research, is again based on a confusion — this time of the whole dream with the dream material.

This much, ladies and gentlemen, I wanted to tell you concerning the problems of the dream. You will suspect that I have omitted a great deal, and have yourselves discovered that I had to be inconclusive on almost all points. But that is due to the relation which the phenomena of the dream have to those of the neuroses. We studied the dream by way of introduction to the study of the neuroses, and that was surely more correct than the reverse would have been. But just as the dream prepares us for the understanding of the neuroses, so in turn the correct evaluation of the dream can only be gained after a knowledge of neurotic phenomena has been won.

I do not know what you will think about this, but I must assure you that I do not regret having taken so much of your interest and of your available time for the problems of the dream. There is no other field in which one can so quickly become convinced of the correctness of the assertions by which psychoanalysis stands or falls. It will take the strenuous labor of many months, even years, to show that the symptoms in a case of neurotic break-down have their meaning, serve a purpose, and result from the fortunes of the patient. On the other hand, the efforts of a few hours suffice in proving the same content in a dream product which at first seems incomprehensibly confused, and thereby to confirm all the hypotheses of

psychoanalysis, the unconsciousness of psychic processes, the special mechanism which they follow, and the motive forces which manifest themselves in them. And if we associate the thorough analogy in the construction of the dream and the neurotic symptom with the rapidity of transformation which makes of the dreamer an alert and reasonable individual, we gain the certainty that the neurosis also is based only on a change in the balance of the forces of psychic life.

PART III. GENERAL THEORY OF THE NEUROSES

SIXTEENTH LECTURE. GENERAL THEORY OF THE NEUROSES

Psychoanalysis and Psychiatry

I AM very glad to welcome you back to continue our discussions. I last lectured to you on the psychoanalytic treatment of errors and of the dream. To-day I should like to introduce you to an understanding of neurotic phenomena, which, as you soon will discover, have much in common with both of those topics. But I shall tell you in advance that I cannot leave you to take the same attitude toward me that you had before. At that time I was anxious to take no step without complete reference to your judgment. I discussed much with you, I listened to your objections, in short, I deferred to you and to your "normal common sense." That is no longer possible, and for a very simple reason. As phenomena, the dream and errors were not strange to you. One might say that you had as much experience as I, or that you could easily acquire as much. But neuroses are foreign to you; since you are not doctors yourselves you have had access to them only through what I have told you. Of what use is the best judgment if it is not supported by familiarity with the material in question?

Do not, however, understand this as an announcement of dogmatic lectures which demand your unconditional belief. That would be a gross misunderstanding. I do not wish to convince you. I am out to stimulate your interest and shake your prejudices. If, in consequence of not knowing the facts, you are not in a position to judge, neither should you believe nor condemn. Listen and allow yourselves to be influenced by what I tell you. One cannot be so easily convinced; at least if he comes by convictions without effort, they soon prove to be valueless and unable to hold their own. He only has a right to conviction who has handled the same material for many years and who in so doing has gone through the same new and surprising experiences again and again. Why, in matters of intellect these lightning conversions, these momentary repulsions? Do you not feel that a *coup de foudre*, that love at first sight, originates in quite a different field, namely, in that of the emotions? We do not even demand that our patients should become convinced of and predisposed to psychoanalysis. When they do, they seem suspicious to us. The attitude we prefer in them is one of benevolent scepticism. Will you not also try to let the psychoanalytic conception develop in your mind beside the popular or "psychiatric"?

They will influence each other, mutually measure their strength, and some day work themselves into a decision on your part.

On the other hand, you must not think for a moment that what I present to you as the psychoanalytic conception is a purely speculative system. Indeed, it is a sum total of experiences and observations, either their direct expression or their elaboration. Whether this elaboration is done adequately and whether the method is justifiable will be tested in the further progress of the science. After two and a half decades, now that I am fairly advanced in years, I may say that it was particularly difficult, intensive and all-absorbing work which yielded these observations. I have often had the impression that our opponents were unwilling to take into consideration this objective origin of our statements, as if they thought it were only a question of subjective ideas arising haphazard, ideas to which another may oppose his every passing whim. This antagonistic behavior is not entirely comprehensible to me. Perhaps the physician's habit of steering clear of his neurotic patients and listening so very casually to what they have to say allows him to lose sight of the possibility of deriving anything valuable from his patients' communications, and therefore, of making penetrating observations on them. I take this opportunity of promising you that I shall carry on little controversy in the course of my lectures, least of all with individual controversialists. I have never been able to convince myself of the truth of the saying that controversy is the father of all things. I believe that it comes down to us from the Greek sophist philosophy and errs as does the latter through the overvaluation of dialectics. To me, on the contrary, it seems as if the so-called scientific criticism were on the whole unfruitful, quite apart from the fact that it is almost always carried on in a most personal spirit. For my part, up to a few years ago, I could even boast that I had entered into a regular scientific dispute with only one scholar (Lowenfeld, of Munich). The end of this was that we became friends and have remained friends to this day. But I did not repeat this attempt for a long time, because I was not certain that the outcome would be the same.

Now you will surely judge that so to reject the discussion of literature must evidence stubborness, a very special obtuseness against objections, or, as the kindly colloquialisms of science have it, "a complete personal bias." In answer, I would say that should you attain to a conviction by such hard labor, you would thereby derive a certain right to sustain it with some

tenacity. Furthermore, I should like to emphasize the fact that I have modified my views on certain important points in the course of my researches, changed them and replaced them by new ones, and that I naturally made a public statement of that fact each time. What has been the result of this frankness? Some paid no attention at all to my self-corrections and even to-day criticize me for assertions which have long since ceased to have the same meaning for me. Others reproach me for just this deviation, and on account of it declare me unreliable. For is anyone who has changed his opinions several times still trustworthy; is not his latest assertion, as well, open to error? At the same time he who holds unswervingly to what he has once said, or cannot be made to give it up quickly enough, is called stubborn and biased. In the face of these contradictory criticisms, what else can one do but be himself and act according to his own dictates? That is what I have decided to do, and I will not allow myself to be restrained from modifying and adapting my theories as the progress of my experience demands. In the basic ideas I have hitherto found nothing to change, and I hope that such will continue to be the case.

Now I shall present to you the psychoanalytic conception of neurotic manifestations. The natural thing for me to do is to connect them to the phenomena we have previously treated, for the sake of their analogy as well as their contrast. I will select as symptomatic an act of frequent occurrence in my office hour. Of course, the analyst cannot do much for those who seek him in his medical capacity, and lay the woes of a lifetime before him in fifteen minutes. His deeper knowledge makes it difficult for him to deliver a snap decision as do other physicians— “There is nothing wrong with you” — and to give the advice, “Go to a watering-place for a while.” One of our colleagues, in answer to the question as to what he did with his office patients, said, shrugging his shoulders, that he simply “fines them so many kronen for their mischief-making.” So it will not surprise you to hear that even in the case of very busy analysts, the hours for consultation are not very crowded. I have had the ordinary door between my waiting room and my office doubled and strengthened by a covering of felt. The purpose of this little arrangement cannot be doubted. Now it happens over and over again that people who are admitted from my waiting room omit to close the door behind them; in fact, they almost always leave both doors open. As soon as I have noticed this I insist rather

gruffly that he or she go back in order to rectify the omission, even though it be an elegant gentleman or a lady in all her finery. This gives an impression of misapplied pedantry. I have, in fact, occasionally discredited myself by such a demand, since the individual concerned was one of those who cannot touch even a door knob, and prefer as well to have their attendants spared this contact. But most frequently I was right, for he who conducts himself in this way, and leaves the door from the waiting room into the physician's consultation room open, belongs to the rabble and deserves to be received inhospitably. Do not, I beg you, defend him until you have heard what follows. For the fact is that this negligence of the patient's only occurs when he has been alone in the waiting room and so leaves an empty room behind him, never when others, strangers, have been waiting with him. If that latter is the case, he knows very well that it is in his interest not to be listened to while he is talking to the physician, and never omits to close both the doors with care.

This omission of the patient's is so predetermined that it becomes neither accidental nor meaningless, indeed, not even unimportant, for, as we shall see, it throws light upon the relation of this patient to the physician. He is one of the great number of those who seek authority, who want to be dazzled, intimidated. Perhaps he had inquired by telephone as to what time he had best call, he had prepared himself to come on a crowd of suppliants somewhat like those in front of a branch milk station. He now enters an empty waiting room which is, moreover, most modestly furnished, and he is disappointed. He must demand reparation from the physician for the wasted respect that he had tendered him, and so he omits to close the door between the reception room and the office. By this, he means to say to the physician: "Oh, well, there is no one here anyway, and probably no one will come as long as I am here." He would also be quite unmannerly and supercilious during the consultation if his presumption were not at once restrained by a sharp reminder.

You will find nothing in the analysis of this little symptomatic act which was not previously known to you. That is to say, it asserts that this act is not accidental, but has a motive, a meaning, a purpose, that it has its assignable connections psychologically, and that it serves as a small indication of a more important psychological process. But above all it implies that the process thus intimated is not known to the consciousness of the individual in whom it takes place, for none of the patients who left

the two doors open would have admitted that they meant by this omission to show me their contempt. Some could probably recall a slight sense of disappointment at entering an empty waiting room, but the connection between this impression and the symptomatic act which followed — of these, his consciousness was surely not aware.

Now let us place, side by side with this small analysis of a symptomatic act, an observation on a pathological case. I choose one which is fresh in my mind and which can also be described with relative brevity. A certain measure of minuteness of detail is unavoidable in any such account.

A young officer, home on a short leave of absence, asked me to see his mother-in-law who, in spite of the happiest circumstances, was embittering her own and her people's existence by a senseless idea. I am introduced to a well preserved lady of fifty-three with pleasant, simple manners, who gives the following account without any hesitation: She is most happily married and lives in the country with her husband, who operates a large factory. She cannot say enough for the kind thoughtfulness of her husband. They had married for love thirty years ago, and since then there had never been a shadow, a quarrel or cause for jealousy. Now, even though her two children are well married, the husband and father does not yet want to retire, from a feeling of duty. A year ago there happened the incredible thing, incomprehensible to herself as well. She gave complete credence to an anonymous letter which accused her excellent husband of having an affair with a young girl — and since then her happiness is destroyed. The more detailed circumstances were somewhat as follows: She had a chambermaid with whom she had perhaps too often discussed intimate matters. This girl pursued another young woman with positively malicious enmity because the latter had progressed so much further in life, despite the fact that she was of no better origin. Instead of going into domestic service, the girl had obtained a business training, had entered the factory and in consequence of the short-handedness due to the drafting of the clerks into the army had advanced to a good position. She now lives in the factory itself, meets all the gentlemen socially, and is even addressed as "Miss." The girl who had remained behind in life was of course ready to speak all possible evil of her one-time schoolmate. One day our patient and her chambermaid were talking of an old gentleman who had been visiting at the house, and of whom it was known that he did not live with his wife, but kept another woman as his mistress. She does not know how

it happened that she suddenly remarked, “That would be the most awful thing that could happen to me, if I should ever hear that my good husband also had a mistress.” The next day she received an anonymous letter through the mail which, in a disguised handwriting, carried this very communication which she had conjured up. She concluded — it seems justifiably — that the letter was the handiwork of her malignant chambermaid, for the letter named as the husband’s mistress the self-same woman whom the maid persecuted with her hatred. Our patient, in spite of the fact that she immediately saw through the intrigue and had seen enough in her town to know how little credence such cowardly denunciations deserve, was nevertheless at once prostrated by the letter. She became dreadfully excited and promptly sent for her husband in order to heap the bitterest reproaches upon him. Her husband laughingly denied the accusation and did the best that could be done. He called in the family physician, who was as well the doctor in attendance at the factory, and the latter added his efforts to quiet the unhappy woman. Their further procedure was also entirely reasonable. The chambermaid was dismissed, but the pretended rival was not. Since then, the patient claims she has repeatedly so far calmed herself as no longer to believe the contents of the anonymous letter, but this relief was neither thoroughgoing nor lasting. It was enough to hear the name of the young lady spoken or to meet her on the street in order to precipitate a new attack of suspicion, pain and reproach.

This, now, is the case history of this good woman. It does not need much psychiatric experience to understand that her portrayal of her own case was, if anything, rather too mild in contrast to other nervous patients. The picture, we say, was dissimulated; in reality she had never overcome her belief in the accusation of the anonymous letter.

Now what position does a psychiatrist take toward such a case? We already know what he would do in the case of the symptomatic act of the patient who does not close the doors to the waiting room. He declares it an accident without psychological interest, with which he need not concern himself. But this attitude cannot be maintained toward the pathological case of the jealous woman. The symptomatic act seems no great matter, but the symptom itself claims attention by reason of its gravity. It is bound up with intense subjective suffering while objectively it threatens to break up a home; therefore its claim to psychiatric interest cannot be put aside.

The first endeavor of the psychiatrist is to characterize the symptom by some distinctive feature. The idea with which this woman torments herself cannot in itself be called nonsensical, for it does happen that elderly married men have affairs with young girls. But there is something else about it that is nonsensical and incredible. The patient has no reason beyond the declaration in the anonymous letter to believe that her tender and faithful husband belongs to this sort of married men, otherwise not uncommon. She knows that this letter in itself carries no proof; she can satisfactorily explain its origin; therefore she ought to be able to persuade herself that she has no reason to be jealous. Indeed she does this, but in spite of it she suffers every bit as much as she would if she acknowledged this jealousy as fully justified. We are agreed to call ideas of this sort, which are inaccessible to arguments based on logic or on facts, "*obsessions*." Thus the good lady suffers from an "*obsession of jealousy*" that is surely a distinctive characterization for this pathological case.

Having reached this first certainty, our psychiatric interest will have become aroused. If we cannot do away with a delusion by taking reality into account, it can hardly have arisen from reality. But the delusion, what is its origin? There are delusions of the most widely varied content. Why is it that in our case the content should be jealousy? In what types of persons are obsessions liable to occur, and, in particular, obsessions of jealousy? We would like to turn to the psychiatrist with such questions, but here he leaves us in the lurch. There is only one of our queries which he heeds. He will examine the family history of this woman and *perhaps* will give us the answer: "The people who develop obsessions are those in whose families similar and other psychic disturbances have repeatedly occurred." In other words, if this lady develops an obsession she does so because she was predisposed to it by reason of her heredity. That is certainly something, but is it all that we want to know? Is it all that was effective in causing this breakdown? Shall we be content to assume that it is immaterial, accidental and inexplicable why the obsession of jealousy develops rather than any other? And may we also accept this sentence about the dominance of the influence of heredity in its negative meaning, that is, that no matter what experiences came to this human being she was predestined to develop some kind of obsession? You will want to know why scientific psychiatry will give no further explanation. And I reply, "He is a rascal who gives more than he owns." The psychiatrist does not

know of any path that leads him further in the explanation of such a case. He must content himself with the diagnosis and a prognosis which, despite a wealth of experience, is uncertain.

Yet, can psychoanalysis do more at this point? Indeed yes! I hope to show you that even in so inaccessible a case as this it can discover something which makes the further understanding possible. May I ask you first to note the apparently insignificant fact that the patient actually provoked the anonymous letter which now supports her delusion. The day before, she announces to the intriguing chambermaid that if her husband were to have an affair with a young girl it would be the worst misfortune that could befall her. By so doing she really gave the maid the idea of sending her the anonymous letter. The obsession thus attains a certain independence from the letter; it existed in the patient beforehand — perhaps as a dread; or was it a wish? Consider, moreover, these additional details yielded by an analysis of only two hours. The patient was indeed most helpful when, after telling her story, she was urged to communicate her further thoughts, ideas and recollections. She declared that nothing came to her mind, that she had already told everything. After two hours the undertaking had really to be given up because she announced that she already felt cured and was sure that the morbid idea would not return. Of course, she said this because of this resistance and her fear of continuing the analysis. In these two hours, however, she had let fall certain remarks which made possible definite interpretation, indeed made it incontestable; and this interpretation throws a clear light on the origin of her obsession of jealousy. Namely, she herself was very much infatuated with a certain young man, the very same son-in-law upon whose urging she had come to consult me professionally. She knew nothing of this infatuation, or at least only a very little. Because of the existing relationship, it was very easy for this infatuation to masquerade under the guise of harmless tenderness. With all our further experience it is not difficult to feel our way toward an understanding of the psychic life of this honest woman and good mother. Such an infatuation, a monstrous, impossible thing, could not be allowed to become conscious. But it continued to exist and unconsciously exerted a heavy pressure. Something had to happen, some sort of relief had to be found and the mechanism of displacement which so constantly takes part in the origin of obsessional jealousy offered the most immediate mitigation. If not only she, old woman that she was, was in love with a

young man but if also her old husband had an affair with a young girl, then she would be freed from the voice of her conscience which accused her of infidelity. The phantasy of her husband's infidelity was thus like a cooling salve on her burning wound. Of her own love she never became conscious, but the reflection of it, which would bring her such advantages, now became compulsive, obsessional and conscious. Naturally all arguments directed against the obsession were of no avail since they were directed only to the reflection, and not to the original force to which it owed its strength and which, unimpeachable, lay buried in the unconscious.

Let us now piece together these fragments to see what a short and impeded psychoanalysis can nevertheless contribute to the understanding of this case. It is assumed of course that our inquiries were carefully conducted, a point which I cannot at this place submit to your judgment. In the first place, the obsession becomes no longer nonsensical nor incomprehensible, it is full of meaning, well motivated and an integral part of the patient's emotional experience. Secondly, it is a necessary reaction toward an unconscious psychological process, revealed in other ways, and it is to this very circumstance that it owes its obsessional nature, that is, its resistance to arguments based on logic or fact. In itself the obsession is something wished for, a kind of consolation. Finally, the experiences underlying the condition are such as unmistakably determine an obsession of jealousy and no other. You will also recognize the part played by the two important analogies in the analysis of the symptomatic act with reference to its meaning and intent and also to its relation to an unconscious factor in the situation.

Naturally, we have not yet answered all the questions which may be put on the basis of this case. Rather the case bristles with further problems of a kind which we have not yet been able to solve in any way, and of others which could not be solved because of the disadvantage of the circumstances under which we were working. For example: why is this happily married woman open to an infatuation for her son-in-law, and why does the relief which could have been obtained in other ways come to her by way of this mirror-image, this projection of her own condition upon her husband? I trust you will not think that it is idle and wanton to open such problems. Already we have much material at our disposal for their possible solution. This woman is in that critical age when her sexual needs undergo a sudden and unwelcome exaggeration. This might in itself be

sufficient. In addition, her good and faithful mate may for many years have been lacking in that sufficient sexual capacity which the well-preserved woman needs for her satisfaction. We have learned by experience to know that those very men whose faithfulness is thus placed beyond a doubt are most gentle in their treatment of their wives and unusually forbearing toward their nervous complaints. Furthermore, the fact that it was just the young husband of a daughter who became the object of her abnormal infatuation is by no means insignificant. A strong erotic attachment to the daughter, which in the last analysis leads back to the mother's sexual constitution, will often find a way to live on under such a disguise. May I perhaps remind you in this connection that the relationship between mother and son-in-law has seemed particularly delicate since all time and is one which among primitive peoples gave rise to very powerful taboos and avoidances. It often transgresses our cultural standards positively as well as negatively. I cannot tell you of course which of these three factors were at work in our case; whether two of them only, or whether all of them coöperated, for as you know I did not have the opportunity to continue the analysis beyond two hours.

I realize at this point, ladies and gentlemen, that I have been speaking entirely of things for which your understanding was not prepared. I did this in order to carry through the comparison of psychiatry and psychoanalysis. May I now ask one thing of you? Have you noticed any contradiction between them? Psychiatry does not apply the technical methods of psychoanalysis, and neglects to look for any significance in the content of the obsession. Instead of first seeking out more specific and immediate causes, psychiatry refers us to the very general and remote source — heredity. But does this imply a contradiction, a conflict between them? Do they not rather supplement one another? For does the hereditary factor deny the significance of the experience, is it not rather true that both operate together in the most effective way? You must admit that there is nothing in the nature of psychiatric work which must repudiate psychoanalytic research. Therefore, it is the psychiatrists who oppose psychoanalysis, not psychiatry itself. Psychoanalysis stands in about the same relation to psychiatry as does histology to anatomy. The one studies the outer forms of organs, the other the closer structure of tissues and cells. A contradiction between two types of study, where one simplifies the other, is not easily conceivable. You know that anatomy to-day forms the

basis of scientific medicine, but there was a time when the dissection of human corpses to learn the inner structure of the body was as much frowned upon as the practice of psychoanalysis, which seeks to ascertain the inner workings of the human soul, seems proscribed to-day. And presumably a not too distant time will bring us to the realization that a psychiatry which aspires to scientific depth is not possible without a real knowledge of the deeper unconscious processes in the psychic life.

Perhaps this much-attacked psychoanalysis has now found some friends among you who are anxious to see it justify itself as well from another aspect, namely, the therapeutic side. You know that the therapy of psychiatry has hitherto not been able to influence obsessions. Can psychoanalysis perhaps do so, thanks to its insight into the mechanism of these symptoms? No, ladies and gentlemen, it cannot; for the present at least it is just as powerless in the face of these maladies as every other therapy. We can understand what it was that happened within the patient, but we have no means of making the patient himself understand this. In fact, I told you that I could not extend the analysis of the obsession beyond the first steps. Would you therefore assert that analysis is objectionable in such cases because it remains without result? I think not. We have the right, indeed we have the duty to pursue scientific research without regard to an immediate practical effect. Some day, though we do not know when or where, every little scrap of knowledge will have been translated into skill, even into therapeutic skill. If psychoanalysis were as unsuccessful in all other forms of nervous and psychological disease as it is in the case of the obsession, it would nevertheless remain fully justified as an irreplaceable method of scientific research. It is true that we would then not be in a position to practice it, for the human subjects from which we must learn, live and will in their own right; they must have motives of their own in order to assist in the work, but they would deny themselves to us. Therefore let me conclude this session by telling you that there are comprehensive groups of nervous diseases concerning which our better understanding has actually been translated into therapeutic power; moreover, that in disturbances which are most difficult to reach we can under certain conditions secure results which are second to none in the field of internal therapeutics.

SEVENTEENTH LECTURE. GENERAL THEORY OF THE NEUROSES

The Meaning of the Symptoms

IN the last lecture I explained to you that clinical psychiatry concerns itself very little with the form under which the symptoms appear or with the burden they carry, but that it is precisely here that psychoanalysis steps in and shows that the symptom carries a meaning and is connected with the experience of the patient. The meaning of neurotic symptoms was first discovered by J. Breuer in the study and felicitous cure of a case of hysteria which has since become famous (1880-82). It is true that P. Janet independently reached the same result; literary priority must in fact be accorded to the French scholar, since Breuer published his observations more than a decade later (1893-95) during his period of collaboration with me. On the whole it may be of small importance to us who is responsible for this discovery, for you know that every discovery is made more than once, that none is made all at once, and that success is not meted out according to deserts. America is not named after Columbus. Before Breuer and Janet, the great psychiatrist Leuret expressed the opinion that even for the deliria of the insane, if we only understood how to interpret them, a meaning could be found. I confess that for a considerable period of time I was willing to estimate very highly the credit due to P. Janet in the explanation of neurotic symptoms, because he saw in them the expression of subconscious ideas (*idées inconscientes*) with which the patients were obsessed. But since then Janet has expressed himself most conservatively, as though he wanted to confess that the term “subconscious” had been for him nothing more than a mode of speech, a shift, “*une façon de parler*,” by the use of which he had nothing definite in mind. I now no longer understand Janet’s discussions, but I believe that he has needlessly deprived himself of high credit.

The neurotic symptoms then have their meaning just like errors and the dream, and like these they are related to the lives of the persons in whom they appear. The importance of this insight into the nature of the symptom can best be brought home to you by way of examples. That it is borne out always and in all cases, I can only assert, not prove. He who gathers his own experience will be convinced of it. For certain reasons, however, I

shall draw my instances not from hysteria, but from another fundamentally related and very curious neurosis concerning which I wish to say a few introductory words to you. This so-called compulsion neurosis is not so popular as the widely known hysteria; it is, if I may use the expression, not so noisily ostentatious, behaves more as a private concern of the patient, renounces bodily manifestations almost entirely and creates all its symptoms psychologically. Compulsion neurosis and hysteria are those forms of neurotic disease by the study of which psychoanalysis has been built up, and in whose treatment as well the therapy celebrates its triumphs. Of these the compulsion neurosis, which does not take that mysterious leap from the psychic to the physical, has through psychoanalytic research become more intimately comprehensible and transparent to us than hysteria, and we have come to understand that it reveals far more vividly certain extreme characteristics of the neuroses.

The chief manifestations of compulsion neurosis are these: the patient is occupied by thoughts that in reality do not interest him, is moved by impulses that appear alien to him, and is impelled to actions which, to be sure, afford him no pleasure, but the performance of which he cannot possibly resist. The thoughts may be absurd in themselves or thoroughly indifferent to the individual, often they are absolutely childish and in all cases they are the result of strained thinking, which exhausts the patient, who surrenders himself to them most unwillingly. Against his will he is forced to brood and speculate as though it were a matter of life or death to him. The impulses, which the patient feels within himself, may also give a childish or ridiculous impression, but for the most part they bear the terrifying aspect of temptations to fearful crimes, so that the patient not only denies them, but flees from them in horror and protects himself from actual execution of his desires through inhibitory renunciations and restrictions upon his personal liberty. As a matter of fact he never, not a single time, carries any of these impulses into effect; the result is always that his evasion and precaution triumph. The patient really carries out only very harmless trivial acts, so-called compulsive acts, for the most part repetitions and ceremonious additions to the occupations of every-day life, through which its necessary performances — going to bed, washing, dressing, walking — become long-winded problems of almost insuperable difficulty. The abnormal ideas, impulses and actions are in nowise equally potent in individual forms and cases of compulsion neurosis; it is the rule,

rather, that one or the other of these manifestations is the dominating factor and gives the name to the disease; that all these forms, however, have a great deal in common is quite undeniable.

Surely this means violent suffering. I believe that the wildest psychiatric phantasy could not have succeeded in deriving anything comparable, and if one did not actually see it every day, one could hardly bring oneself to believe it. Do not think, however, that you give the patient any help when you coax him to divert himself, to put aside these stupid ideas and to set himself to something useful in the place of his whimsical occupations. This is just what he would like of his own accord, for he possesses all his senses, shares your opinion of his compulsion symptoms, in fact volunteers it quite readily. But he cannot do otherwise; whatever activities actually are released under compulsion neurosis are carried along by a driving energy, such as is probably never met with in normal psychic life. He has only one remedy — to transfer and change. In place of one stupid idea he can think of a somewhat milder absurdity, he can proceed from one precaution and prohibition to another, or carry through another ceremonial. He may shift, but he cannot annul the compulsion. One of the chief characteristics of the sickness is the instability of the symptoms; they can be shifted very far from their original form. It is moreover striking that the contrasts present in all psychological experience are so very sharply drawn in this condition. In addition to the compulsion of positive and negative content, an intellectual doubt makes itself felt that gradually attacks the most ordinary and assured certainties. All these things merge into steadily increasing uncertainty, lack of energy, curtailment of personal liberty, despite the fact that the patient suffering from compulsion neurosis is originally a most energetic character, often of extraordinary obstinacy, as a rule intellectually gifted above the average. For the most part he has attained a desirable stage of ethical development, is overconscientious and more than usually correct. You can imagine that it takes no inconsiderable piece of work to find one’s way through this maze of contradictory characteristics and symptoms. Indeed, for the present our only object is to understand and to interpret some symptoms of this disease.

Perhaps in reference to our previous discussions, you would like to know the position of present-day psychiatry to the problems of the compulsion neurosis. This is covered in a very slim chapter. Psychiatry

gives names to the various forms of compulsion, but says nothing further concerning them. Instead it emphasizes the fact that those who show these symptoms are degenerates. That yields slight satisfaction, it is an ethical judgment, a condemnation rather than an explanation. We are led to suppose that it is in the unsound that all these peculiarities may be found. Now we do believe that persons who develop such symptoms must differ fundamentally from other people. But we would like to ask, are they more "degenerate" than other nervous patients, those suffering, for instance, from hysteria or other diseases of the mind? The characterization is obviously too general. One may even doubt whether it is at all justified, when one learns that such symptoms occur in excellent men and women of especially great and universally recognized ability. In general we glean very little intimate knowledge of the great men who serve us as models. This is due both to their own discretion and to the lying propensities of their biographers. Sometimes, however, a man is a fanatic disciple of truth, such as Emile Zola, and then we hear from him the strange compulsion habits from which he suffered all his life.

Psychiatry has resorted to the expedient of speaking of "superior degenerates." Very well — but through psychoanalysis we have learned that these peculiar compulsion symptoms may be permanently removed just like any other disease of normal persons. I myself have frequently succeeded in doing this.

I will give you two examples only of the analysis of compulsion symptoms, one, an old observation, which cannot be replaced by anything more complete, and one a recent study. I am limiting myself to such a small number because in an account of this nature it is necessary to be very explicit and to enter into every detail.

A lady about thirty years old suffered from the most severe compulsions. I might indeed have helped her if caprice of fortune had not destroyed my work — perhaps I will yet have occasion to tell you about it. In the course of each day the patient often executed, among others, the following strange compulsive act. She ran from her room into an adjoining one, placed herself in a definite spot beside a table which stood in the middle of the room, rang for her maid, gave her a trivial errand to do, or dismissed her without more ado, and then ran back again. This was certainly not a severe symptom of disease, but it still deserved to arouse curiosity. Its explanation was found, absolutely without any assistance on

the part of the physician, in the very simplest way, a way to which no one can take exception. I hardly know how I alone could have guessed the meaning of this compulsive act, or have found any suggestion toward its interpretation. As often as I had asked the patient: “Why do you do this? Of what use is it?” she had answered, “I don’t know.” But one day after I had succeeded in surmounting a grave ethical doubt of hers she suddenly saw the light and related the history of the compulsive act. More than ten years prior she had married a man far older than herself, who had proved impotent on the bridal night. Countless times during the night he had run from his room to hers to repeat the attempt, but each time without success. In the morning he said angrily: “It is enough to make one ashamed before the maid who does the beds,” and took a bottle of red ink that happened to be in the room, and poured its contents on the sheet, but not on the place where such a stain would have been justifiable. At first I did not understand the connection between this reminiscence and the compulsive act in question, for the only agreement I could find between them was in the running from one room into another, — possibly also in the appearance of the maid. Then the patient led me to the table in the second room and let me discover a large spot on the cover. She explained also that she placed herself at the table in such a way that the maid could not miss seeing the stain. Now it was no longer possible to doubt the intimate relation of the scene after her bridal night and her present compulsive act, but there were still a number of things to be learned about it.

In the first place, it is obvious that the patient identifies herself with her husband, she is acting his part in her imitation of his running from one room into the other. We must then admit — if she holds to this role — that she replaces the bed and sheet by table and cover. This may seem arbitrary, but we have not studied dream symbolism in vain. In dreams also a table which must be interpreted as a bed, is frequently seen. “Bed and board” together represent married life, one may therefore easily be used to represent the other.

The evidence that the compulsive act carries meaning would thus be plain; it appears as a representation, a repetition of the original significant scene. However, we are not forced to stop at this semblance of a solution; when we examine more closely the relation between these two people, we shall probably be enlightened concerning something of wider importance, namely, the purpose of the compulsive act. The nucleus of this purpose is

evidently the summoning of the maid; to her she wishes to show the stain and refute her husband's remark: "It is enough to shame one before the maid." He — whose part she is playing — therefore feels no shame before the maid, hence the stain must be in the right place. So we see that she has not merely repeated the scene, rather she has amplified it, corrected it and "turned it to the good." Thereby, however, she also corrects something else, — the thing which was so embarrassing that night and necessitated the use of the red ink — impotence. The compulsive act then says: "No, it is not true, he did not have to be ashamed before the maid, he was not impotent." After the manner of a dream she represents the fulfillment of this wish in an overt action, she is ruled by the desire to help her husband over that unfortunate incident.

Everything else that I could tell you about this case supports this clue more specifically; all that we otherwise know about her tends to strengthen this interpretation of a compulsive act incomprehensible in itself. For years the woman has lived separated from her husband and is struggling with the intention to obtain a legal divorce. But she is by no means free from him; she forces herself to remain faithful to him, she retires from the world to avoid temptation; in her imagination she excuses and idealizes him. The deepest secret of her malady is that by means of it she shields her husband from malicious gossip, justifies her separation from him, and renders possible for him a comfortable separate life. Thus the analysis of a harmless compulsive act leads to the very heart of this case and at the same time reveals no inconsiderable portion of the secret of the compulsion neurosis in general. I shall be glad to have you dwell upon this instance, as it combines conditions that one can scarcely demand in other cases. The interpretation of the symptoms was discovered by the patient herself in one flash, without the suggestion or interference of the analyst. It came about by the reference to an experience, which did not, as is usually the case, belong to the half-forgotten period of childhood, but to the mature life of the patient, in whose memory it had remained unobliterated. All the objections which critics ordinarily offer to our interpretation of symptoms fail in this case. Of course, we are not always so fortunate.

And one thing more! Have you not observed how this insignificant compulsive act initiated us into the intimate life of the invalid? A woman can scarcely relate anything more intimate than the story of her bridal

night, and is it without further significance that we just happened to come on the intimacies of her sexual life? It might of course be the result of the selection I have made in this instance. Let us not judge too quickly and turn our attention to the second instance, one of an entirely different kind, a sample of a frequently occurring variety, namely, the sleep ritual.

A nineteen-year old, well-developed, gifted girl, an only child, who was superior to her parents in education and intellectual activity, had been wild and mischievous in her childhood, but has become very nervous during the last years without any apparent outward cause. She is especially irritable with her mother, always discontented, depressed, has a tendency toward indecision and doubt, and is finally forced to confess that she can no longer walk alone on public squares or wide thoroughfares. We shall not consider at length her complicated condition, which requires at least two diagnoses — agoraphobia and compulsion neurosis. We will dwell only upon the fact that this girl has also developed a sleep ritual, under which she allows her parents to suffer much discomfort. In a certain sense, we may say that every normal person has a sleep ritual, in other words that he insists on certain conditions, the absence of which hinders him from falling asleep; he has created certain observances by which he bridges the transition from waking to sleeping and these he repeats every evening in the same manner. But everything that the healthy person demands in order to obtain sleep is easily understandable and, above all, when external conditions necessitate a change, he adapts himself easily and without loss of time. But the pathological ritual is rigid, it persists by virtue of the greatest sacrifices, it also masks itself with a reasonable justification and seems, in the light of superficial observation, to differ from the normal only by exaggerated pedantry. But under closer observation we notice that the mask is transparent, for the ritual covers intentions that go far beyond this reasonable justification, and other intentions as well that are in direct contradiction to this reasonable justification. Our patient cites as the motive of her nightly precautions that she must have quiet in order to sleep; therefore she excludes all sources of noise. To accomplish this, she does two things: the large clock in her room is stopped, all other clocks are removed; not even the wrist watch on her night-table is suffered to remain. Flowerpots and vases are placed on her desk so that they cannot fall down during the night, and in breaking disturb her sleep. She knows that these precautions are scarcely justifiable for the sake of quiet; the ticking of the

small watch could not be heard even if it should remain on the night-table, and moreover we all know that the regular ticking of a clock is conducive to sleep rather than disturbing. She does admit that there is not the least probability that flowerpots and vases left in place might of their own accord fall and break during the night. She drops the pretense of quiet for the other practice of this sleep ritual. She seems on the contrary to release a source of disturbing noises by the demand that the door between her own room and that of her parents remain half open, and she insures this condition by placing various objects in front of the open door. The most important observances concern the bed itself. The large pillow at the head of the bed may not touch the wooden back of the bed. The small pillow for her head must lie on the large pillow to form a rhomb; she then places her head exactly upon the diagonal of the rhomb. Before covering herself, the featherbed must be shaken so that its foot end becomes quite flat, but she never omits to press this down and redistribute the thickness.

Allow me to pass over the other trivial incidents of this ritual; they would teach us nothing new and cause too great digression from our purpose. Do not overlook, however, the fact that all this does not run its course quite smoothly. Everything is pervaded by the anxiety that things have not been done properly; they must be examined, repeated. Her doubts seize first on one, then on another precaution, and the result is that one or two hours elapse during which the girl cannot and the intimidated parents dare not sleep.

These torments were not so easily analyzed as the compulsive act of our former patient. In the working out of the interpretations I had to hint and suggest to the girl, and was met on her part either by positive denial or mocking doubt. This first reaction of denial, however, was followed by a time when she occupied herself of her own accord with the possibilities that had been suggested, noted the associations they called out, produced reminiscences, and established connections, until through her own efforts she had reached and accepted all interpretations. In so far as she did this, she desisted as well from the performance of her compulsive rules, and even before the treatment had ended she had given up the entire ritual. You must also know that the nature of present-day analysis by no means enables us to follow out each individual symptom until its meaning becomes clear. Rather it is necessary to abandon a given theme again and again, yet with the certainty that we will be led back to it in some other

connection. The interpretation of the symptoms in this case, which I am about to give you, is a synthesis of results, which, with the interruptions of other work, needed weeks and months for their compilation.

Our patient gradually learns to understand that she has banished clocks and watches from her room during the night because the clock is the symbol of the female genital. The clock, which we have learned to interpret as a symbol for other things also, receives this role of the genital organ through its relation to periodic occurrences at equal intervals. A woman may for instance be found to boast that her menstruation is as regular as clockwork. The special fear of our patient, however, was that the ticking of the clock would disturb her in her sleep. The ticking of the clock may be compared to the throbbing of the clitoris during sexual excitement. Frequently she had actually been awakened by this painful sensation and now this fear of an erection of the clitoris caused her to remove all ticking clocks during the night. Flowerpots and vases are, as are all vessels, also female symbols. The precaution, therefore, that they should not fall and break at night, was not without meaning. We know the widespread custom of breaking a plate or dish when an engagement is celebrated. The fragment of which each guest possesses himself symbolizes his renunciation of his claim to the bride, a renunciation which we may assume as based on the monogamous marriage law. Furthermore, to this part of her ceremonial our patient adds a reminiscence and several associations. As a child she had slipped once and fallen with a bowl of glass or clay, had cut her finger, and bled violently. As she grew up and learned the facts of sexual intercourse, she developed the fear that she might not bleed during her bridal night and so not prove to be a virgin. Her precaution against the breaking of vases was a rejection of the entire virginity complex, including the bleeding connected with the first cohabitation. She rejected both the fear to bleed and the contradictory fear not to bleed. Indeed her precautions had very little to do with a prevention of noise.

One day she guessed the central idea of her ceremonial, when she suddenly understood her rule not to let the pillow come in contact with the bed. The pillows always had seemed a woman to her, the erect back of the bed a man. By means of magic, we may say, she wished to keep apart man and wife; it was her parents she wished to separate, so to prevent their marital intercourse. She had sought to attain the same end by more direct

methods in earlier years, before the institution of her ceremonial. She had simulated fear or exploited a genuine timidity in order to keep open the door between the parents' bedroom and the nursery. This demand had been retained in her present ceremonial. Thus she had gained the opportunity of overhearing her parents, a proceeding which at one time subjected her to months of sleeplessness. Not content with this disturbance to her parents, she was at that time occasionally able to gain her point and sleep between father and mother in their very bed. Then "pillow" and "wooden wall" could really not come in contact. Finally when she became so big that her presence between the parents could not longer be borne comfortably, she consciously simulated fear and actually succeeded in changing places with her mother and taking her place at her father's side. This situation was undoubtedly the starting point for the phantasies, whose after-effects made themselves felt in her ritual.

If a pillow represented a woman, then the shaking of the featherbed till all the feathers were lumped at one end, rounding it into a prominence, must have its meaning also. It meant the impregnation of the wife; the ceremonial, however, never failed to provide for the annulment, of this pregnancy by the flattening down of the feathers. Indeed, for years our patient had feared that the intercourse between her parents might result in another child which would be her rival. Now, where the large pillow represents a woman, the mother, then the small pillow could be nothing but the daughter. Why did this pillow have to be placed so as to form a rhomb; and why did the girl's head have to rest exactly upon the diagonal? It was easy to remind the patient that the rhomb on all walls is the rune used to represent the open female genital. She herself then played the part of the man, the father, and her head took the place of the male organ. (Cf. the symbol of beheading to represent castration.)

Wild ideas, you will say, to run riot in the head of a virgin girl. I admit it, but do not forget that I have not created these ideas but merely interpreted them. A sleep ritual of this kind is itself very strange, and you cannot deny the correspondence between the ritual and the phantasies that yielded us the interpretation. For my part I am most anxious that you observe in this connection that no single phantasy was projected in the ceremonial, but a number of them had to be integrated, — they must have their nodal points somewhere in space. Observe also that the observance of

the ritual reproduce the sexual desire now positively, now negatively, and serve in part as their rejection, again as their representation.

It would be possible to make a better analysis of this ritual by relating it to other symptoms of the patient. But we cannot digress in that direction. Let the suggestion suffice that the girl is subject to an erotic attachment to her father, the beginning of which goes back to her earliest childhood. That perhaps is the reason for her unfriendly attitude toward her mother. Also we cannot escape the fact that the analysis of this symptom again points to the sexual life of the patient. The more we penetrate to the meaning and purpose of neurotic symptoms, the less surprising will this seem to us.

By means of two selected illustrations I have demonstrated to you that neurotic symptoms carry just as much meaning as do errors and the dream, and that they are intimately connected with the experience of the patient. Can I expect you to believe this vitally significant statement on the strength of two examples? No. But can you expect me to cite further illustrations until you declare yourself convinced? That too is impossible, since considering the explicitness with which I treat each individual case, I would require a five-hour full semester course for the explanation of this one point in the theory of the neuroses. I must content myself then with having given you one proof for my assertion and refer you for the rest to the literature of the subject, above all to the classical interpretation of symptoms in Breuer’s first case (hysteria) as well as to the striking clarification of obscure symptoms in the so-called dementia praecox by C. G. Jung, dating from the time when this scholar was still content to be a mere psychoanalyst — and did not yet want to be a prophet; and to all the articles that have subsequently appeared in our periodicals. It is precisely investigations of this sort which are plentiful. Psychoanalysts have felt themselves so much attracted by the analysis, interpretation and translation of neurotic symptoms, that by contrast they seem temporarily to have neglected other problems of neurosis.

Whoever among you takes the trouble to look into the matter will undoubtedly be deeply impressed by the wealth of evidential material. But he will also encounter difficulties. We have learned that the meaning of a symptom is found in its relation to the experience of the patient. The more highly individualized the symptom is, the sooner we may hope to establish these relations. Therefore the task resolves itself specifically into the

discovery for every nonsensical idea and useless action of a past situation wherein the idea had been justified and the action purposeful. A perfect example for this kind of symptom is the compulsive act of our patient who ran to the table and rang for the maid. But there are symptoms of a very different nature which are by no means rare. They must be called typical symptoms of the disease, for they are approximately alike in all cases, in which the individual differences disappear or shrivel to such an extent that it is difficult to connect them with the specific experiences of the patient and to relate them to the particular situations of his past. Let us again direct our attention to the compulsion neurosis. The sleep ritual of our second patient is already quite typical, but bears enough individual features to render possible what may be called an *historic* interpretation. But all compulsive patients tend to repeat, to isolate their actions from others and to subject them to a rhythmic sequence. Most of them wash too much. Agoraphobia (topophobia, fear of spaces), a malady which is no longer grouped with the compulsion neurosis, but is now called anxiety hysteria, invariably shows the same pathological picture; it repeats with exhausting monotony the same feature, the patient's fear of closed spaces, of large open squares, of long stretched streets and parkways, and their feeling of safety when acquaintances accompany them, when a carriage drives after them, etc. On this identical groundwork, however, the individual differences between the patients are superimposed — moods one might almost call them, which are sharply contrasted in the various cases. The one fears only narrow streets, the other only wide ones, the one can go out walking only when there are few people abroad, the other when there are many. Hysteria also, aside from its wealth of individual features, has a superfluity of common typical symptoms that appear to resist any facile historical methods of tracing them. But do not let us forget that it is by these typical symptoms that we get our bearings in reaching a diagnosis. When, in one case of hysteria we have finally traced back a typical symptom to an experience or a series of similar experiences, for instance followed back an hysterical vomiting to its origin in a succession of disgust impressions, another case of vomiting will confuse us by revealing an entirely different chain of experiences, seemingly just as effective. It seems almost as though hysterical patients must vomit for some reason as yet unknown, and that the historic factors, revealed by

analysis, are chance pretexts, seized on as opportunity best offered to serve the purposes of a deeper need.

Thus we soon reach the discouraging conclusion that although we can satisfactorily explain the individual neurotic symptom by relating it to an experience, our science fails us when it comes to the typical symptoms that occur far more frequently. In addition, remember that I am not going into all the detailed difficulties which come up in the course of resolutely hunting down an historic interpretation of the symptom. I have no intention of doing this, for though I want to keep nothing from you, and so paint everything in its true colors, I still do not wish to confuse and discourage you at the very outset of our studies. It is true that we have only begun to understand the interpretation of symptoms, but we wish to hold fast to the results we have achieved, and struggle forward step by step toward the mastery of the still unintelligible data. I therefore try to cheer you with the thought that a fundamental between the two kinds of symptoms can scarcely be assumed. Since the individual symptoms are so obviously dependent upon the experience of the patient, there is a possibility that the typical symptoms revert to an experience that is in itself typical and common to all humanity. Other regularly recurring features of neurosis, such as the repetition and doubt of the compulsion neurosis, may be universal reactions which are forced upon the patient by the very nature of the abnormal change. In short, we have no reason to be prematurely discouraged; we shall see what our further results will yield.

We meet a very similar difficulty in the theory of dreams, which in our previous discussion of the dream I could not go into. The manifest content of dreams is most profuse and individually varied, and I have shown very explicitly what analysis may glean from this content. But side by side with these dreams there are others which may also be termed “typical” and which occur similarly in all people. These are dreams of identical content which offer the same difficulties for their interpretation as the typical symptom. They are the dreams of falling, flying, floating, swimming, of being hemmed in, of nakedness, and various other anxiety dreams that yield first one and then another interpretation for the different patients, without resulting in an explanation of their monotonous and typical recurrence. In the matter of these dreams also, we see a fundamental groundwork enriched by individual additions. Probably they as well can be fitted into the theory of dream life, built up on the basis of other dreams,

— not however by straining the point, but by the gradual broadening of our views.

EIGHTEENTH LECTURE. GENERAL THEORY OF THE NEUROSES

Traumatic Fixation — The Unconscious

I SAID last time that we would not continue our work from the standpoint of our doubts, but on the basis of our results. We have not even touched upon two of the most interesting conclusions, derived equally from the same two sample analyses.

In the first place, both patients give us the impression of being *fixated* upon some very definite part of their past; they are unable to free themselves therefrom, and have therefore come to be completely estranged both from the present and the future. They are now isolated in their ailment, just as in earlier days people withdrew into monasteries there to carry along the burden of their unhappy fates. In the case of the first patient, it is her marriage with her husband, really abandoned, that has determined her lot. By means of her symptoms she continues to deal with her husband; we have learned to understand those voices which plead his case, which excuse him, exalt him, lament his loss. Although she is young and might be coveted by other men, she has seized upon all manner of real and imaginary (magic) precautions to safeguard her virtue for him. She will not appear before strangers, she neglects her personal appearance; furthermore, she cannot bring herself to get up readily from any chair on which she has been seated. She refuses to give her signature, and finally, since she is motivated by her desire not to let anyone have anything of hers, she is unable to give presents.

In the case of the second patient, the young girl, it is an erotic attachment for her father that had established itself in the years prior to puberty, which plays the same role in her life. She also has arrived at the conclusion that she may not marry so long as she is sick. We may suspect she became ill in order that she need not marry, and that she might stay with her father.

It is impossible to evade the question of how, in what manner, and driven by what motives, an individual may come by such a remarkable and unprofitable attitude toward life. Granted of course that this bearing is a general characteristic of neurosis, and not a special peculiarity of these two cases, it is nevertheless a general trait in every neurosis of very great

importance in practice. Breuer's first hysterical patient was fixated in the same manner upon the time when she nursed her very sick father. In spite of her recuperation she has, in certain respects, since that time, been done with life; although she remained healthy and able, she did not enter on the normal life of women. In every one of our patients we may see, by the use of analysis, that in his disease-symptoms and their results he has gone back again into a definite period of his past. In the majority of cases he even chooses a very early phase of his life, sometime a childhood phase, indeed, laughable as it may appear, a phase of his very suckling existence.

The closest analogies to these conditions of our neurotics are furnished by the types of sickness which the war has just now made so frequent — the so-called traumatic neuroses. Even before the war there were such cases after railroad collisions and other frightful occurrences which endangered life. The traumatic neuroses are, fundamentally, not the same as the spontaneous neuroses which we have been analysing and treating; moreover, we have not yet succeeded in bringing them within our hypotheses, and I hope to be able to make clear to you wherein this limitation lies. Yet on one point we may emphasize the existence of a complete agreement between the two forms. The traumatic neuroses show clear indications that they are grounded in a fixation upon the moment of the traumatic disaster. In their dreams these patients regularly live over the traumatic situation; where there are attacks of an hysterical type, which permit of an analysis, we learn that the attack approximates a complete transposition into this situation. It is as if these patients had not yet gotten through with the traumatic situation, as if it were actually before them as a task which was not yet mastered. We take this view of the matter in all seriousness; it shows the way to an *economic* view of psychic occurrences. For the expression "traumatic" has no other than an economic meaning, and the disturbance permanently attacks the management of available energy. The traumatic experience is one which, in a very short space of time, is able to increase the strength of a given stimulus so enormously that its assimilation, or rather its elaboration, can no longer be effected by normal means.

This analogy tempts us to classify as traumatic those experiences as well upon which our neurotics appear to be fixated. Thus the possibility is held out to us of having found a simple determining factor for the neurosis. It would then be comparable to a traumatic disease, and would

arise from the inability to meet an overpowering emotional experience. As a matter of fact this reads like the first formula, by which Breuer and I, in 1893-1895, accounted theoretically for our new observations. A case such as that of our first patient, the young woman separated from her husband, is very well explained by this conception. She was not able to get over the unfeasibility of her marriage, and has not been able to extricate herself from this trauma. But our very next, that of the girl attached to her father, shows us that the formula is not sufficiently comprehensive. On the one hand, such baby love of a little girl for her father is so usual, and so often outlived that the designation “traumatic” would carry no significance; on the other hand, the history of the patient teaches us that this first erotic fixation apparently passed by harmlessly at the time, and did not again appear until many years later in the symptoms of the compulsion neurosis. We see complications before us, the existence of a greater wealth of determining factors in the disease, but we also suspect that the traumatic viewpoint will not have to be given up as wrong; rather it will have to subordinate itself when it is fitted into a different context.

Here again we must leave the road we have been traveling. For the time being, it leads us no further and we have many other things to find out before we can go on again. But before we leave this subject let us note that the fixation on some particular phase of the past has bearings which extend far beyond the neurosis. Every neurosis contains such a fixation, but every fixation does not lead to a neurosis, nor fall into the same class with neuroses, nor even set the conditions for the development of a neurosis. Mourning is a type of emotional fixation on a theory of the past, which also brings with it the most complete alienation from the present and the future. But mourning is sharply distinguished from neuroses that may be designated as pathological forms of mourning.

It also happens that men are brought to complete deadlock by a traumatic experience that has so completely shaken the foundations on which they have built their lives that they give up all interest in the present and future, and become completely absorbed in their retrospections; but these unhappy persons are not necessarily neurotic. We must not overestimate this one feature as a diagnostic for a neurosis, no matter how invariable and potent it may be.

Now let us turn to the second conclusion of our analysis, which however we will hardly need to limit subsequently. We have spoken of the

senseless compulsive activities of our first patient, and what intimate memories she disclosed as belonging to them; later we also investigated the connection between experience and symptom and thus discovered the purpose hidden behind the compulsive activity. But we have entirely omitted one factor that deserves our whole attention. As long as the patient kept repeating the compulsive activity she did not know that it was in any way related with the experience in question. The connection between the two was hidden from her, she truthfully answered that she did not know what compelled her to do this. Once, suddenly, under the influence of the cure, she hit upon the connection and was able to tell it to us. But still she did not know of the end in the service of which she performed the compulsive activities, the purpose to correct a painful part of the past and to place the husband, still loved by her, upon a higher level. It took quite a long time and a great deal of trouble for her to grasp and admit to me that such a motive alone could have been the motive force of the compulsive activity.

The relation between the scene after the unhappy bridal night and the tender motive of the patient yield what we have called the meaning of the compulsive activity. But both the “whence” and the “why” remained hidden from her as long as she continued to carry out the compulsive act. Psychological processes had been going on within her for which the compulsive act found an expression. She could, in a normal frame of mind, observe their effect, but none of the psychological antecedents of her action had come to the knowledge of her consciousness. She had acted in just the same manner as a hypnotized person to whom Bernheim had given the injunction that five minutes after his awakening in the ward he was to open an umbrella, and he had carried out this order on awakening, but could give no motive for his so doing. We have exactly such facts in mind when we speak of the existence of *unconscious psychological processes*. Let anyone in the world account for these facts in a more correct scientific manner, and we will gladly withdraw completely our assumption of unconscious psychological processes. Until then, however, we shall continue to use this assumption, and when anyone wants to bring forward the objection that the unconscious can have no reality for science and is a mere makeshift, (*une façon de parler*), we must simply shrug our shoulders and reject his incomprehensible statement resignedly. A strange

unreality which can call out such real and palpable effects as a compulsion symptom!

In our second patient we meet with fundamentally the same thing. She had created a decree which she must follow: the pillow must not touch the head of the bed; yet she does not know how it originated, what its meaning is, nor to what motive it owes the source of its power. It is immaterial whether she looks upon it with indifference or struggles against it, storms against it, determines to overcome it. She must nevertheless follow it and carry out its ordinance, though she asks herself, in vain, why. One must admit that these symptoms of compulsion neurosis offer the clearest evidence for a special sphere of psychological activity, cut off from the rest. What else could be back of these images and impulses, which appear from one knows not where, which have such great resistance to all the influences of an otherwise normal psychic life; which give the patient himself the impression that here are super-powerful guests from another world, immortals mixing in the affairs of mortals. Neurotic symptoms lead unmistakably to a conviction of the existence of an unconscious psychology, and for that very reason clinical psychiatry, which recognizes only a conscious psychology, has no explanation other than that they are present as indications of a particular kind of degeneration. To be sure, the compulsive images and impulses are not themselves unconscious — no more so than the carrying out of the compulsive-acts escapes conscious observation. They would not have been symptoms had they not penetrated through into consciousness. But their psychological antecedents as disclosed by the analysis, the associations into which we place them by our interpretations, are unconscious, at least until we have made them known to the patient during the course of the analysis.

Consider now, in addition, that the facts established in our two cases are confirmed in all the symptoms of all neurotic diseases, that always and everywhere the meaning of the symptoms is unknown to the sufferer, that analysis shows without fail that these symptoms are derivatives of unconscious experiences which can, under various favorable conditions, become conscious. You will understand then that in psychoanalysis we cannot do without this unconscious psyche, and are accustomed to deal with it as with something tangible. Perhaps you will also be able to understand how those who know the unconscious only as an idea, who have never analyzed, never interpreted dreams, or never translated

neurotic symptoms into meaning and purpose, are most ill-suited to pass an opinion on this subject. Let us express our point of view once more. Our ability to give meaning to neurotic symptoms by means of analytic interpretation is an irrefutable indication of the existence of unconscious psychological processes — or, if you prefer, an irrefutable proof of the necessity for their assumption.

But that is not all. Thanks to a second discovery of Breuer's, for which he alone deserves credit and which appears to me to be even more far-reaching, we are able to learn still more concerning the relationship between the unconscious and the neurotic symptom. Not alone is the meaning of the symptoms invariably hidden in the unconscious; but the very existence of the symptom is conditioned by its relation to this unconscious. You will soon understand me. With Breuer I maintain the following: Every time we hit upon a symptom we may conclude that the patient cherishes definite unconscious experiences which withhold the meaning of the symptoms. Vice versa, in order that the symptoms may come into being, it is also essential that this meaning be unconscious. Symptoms are not built up out of conscious experiences; as soon as the unconscious processes in question become conscious, the symptom disappears. You will at once recognize here the approach to our therapy, a way to make symptoms disappear. It was by these means that Breuer actually achieved the recovery of his patient, that is, freed her of her symptoms; he found a technique for bringing into her consciousness the unconscious experiences that carried the meaning of her symptoms, and the symptoms disappeared.

This discovery of Breuer's was not the result of a speculation, but of a felicitous observation made possible by the coöperation of the patient. You should therefore not trouble yourself to find things you already know to which you can compare these occurrences, rather you should recognize herein a new fundamental fact which in itself is capable of much wider application. Toward this further end permit me to go over this ground again in a different way.

The symptom develops as a substitution for something else that has remained suppressed. Certain psychological experiences should normally have become so far elaborated that consciousness would have attained knowledge of them. This did not take place, however, but out of these interrupted and disturbed processes, imprisoned in the unconscious, the

symptom arose. That is to say, something in the nature of an interchange had been effected; as often as therapeutic measures are successful in again reversing this transposition, psychoanalytic therapy solves the problem of the neurotic symptom.

Accordingly, Breuer's discovery still remains the foundation of psychoanalytic therapy. The assertion that the symptoms disappear when one has made their unconscious connections conscious, has been borne out by all subsequent research, although the most extraordinary and unexpected complications have been met with in its practical execution. Our therapy does its work by means of changing the unconscious into the conscious, and is effective only in so far as it has the opportunity of bringing about this transformation.

Now we shall make a hasty digression so that you do not by any chance imagine that this therapeutic work is too easy. From all we have learned so far, the neurosis would appear as the result of a sort of ignorance, the incognizance of psychological processes that we should know of. We would thus very closely approximate the well-known Socratic teachings, according to which evil itself is the result of ignorance. Now the experienced physician will, as a rule, discover fairly readily what psychic impulses in his several patients have remained unconscious. Accordingly it would seem easy for him to cure the patient by imparting this knowledge to him and freeing him of his ignorance. At least the part played by the unconscious meaning of the symptoms could easily be discovered in this manner, and it would only be in dealing with the relationship of the symptoms to the experiences of the patient that the physician would be handicapped. In the face of these experiences, of course, he is the ignorant one of the two, for he did not go through these experiences, and must wait until the patient remembers them and tells them to him. But in many cases this difficulty could be readily overcome. One can question the relatives of the patient concerning these experiences, and they will often be in a position to point out those that carry any traumatic significance; they may even be able to inform the analyst of experiences of which the patient knows nothing because they occurred in the very early years of his life. By a combination of such means it would seem that the pathogenic ignorance of the patient could be cleared up in a short time and without much trouble.

If only that were all! We have made discoveries for which we were at first unprepared. Knowing and knowing is not always the same thing; there are various kinds of knowing that are psychologically by no means comparable. "*Il y a fagots et fagots*," as Molière says. The knowledge of the physician is not the same as that of the patient and cannot bring about the same results. The physician can gain no results by transferring his knowledge to the patient in so many words. This is perhaps putting it incorrectly, for though the transference does not result in dissolving the symptoms, it does set the analysis in motion, and calls out an energetic denial, the first sign usually that this has taken place. The patient has learned something that he did not know up to that time, the meaning of his symptoms, and yet he knows it as little as before. So we discover there is more than one kind of ignorance. It will require a deepening of our psychological insight to make clear to us wherein the difference lies. But our assertion nevertheless remains true that the symptoms disappear with the knowledge of their meaning. For there is only one limiting condition; the knowledge must be founded on an inner change in the patient which can be attained only through psychic labors directed toward a definite end. We have here been confronted by problems which will soon lead us to the elaboration of a dynamics of symptom formation.

I must stop to ask you whether this is not all too vague and too complicated? Do I not confuse you by so often retracting my words and restricting them, spinning out trains of thought and then rejecting them? I should be sorry if this were the case. However, I strongly dislike simplification at the expense of truth, and am not averse to having you receive the full impression of how many-sided and complicated the subject is. I also think that there is no harm done if I say more on every point than you can at the moment make use of. I know that every hearer and reader arranges what is offered him in his own thoughts, shortens it, simplifies it and extracts what he wishes to retain. Within a given measure it is true that the more we begin with the more we have left. Let me hope that, despite all the by-play, you have clearly grasped the essential parts of my remarks, those about the meaning of symptoms, about the unconscious, and the relation between the two. You probably have also understood that our further efforts are to take two directions: first, the clinical problem — to discover how persons become sick, how they later on accomplish a neurotic adaptation toward life; secondly, a problem of

psychic dynamics, the evolution of the neurotic symptoms themselves from the prerequisites of the neuroses. We will undoubtedly somewhere come on a point of contact for these two problems.

I do not wish to go any further to-day, but since our time is not yet up I intend to call your attention to another characteristic of our two analyses, namely, the memory gaps or amnesias, whose full appreciation will be possible later. You have heard that it is possible to express the object of psychoanalytic treatment in a formula: all pathogenic unconscious experience must be transposed into consciousness. You will perhaps be surprised to learn that this formula can be replaced by another: all the memory gaps of the patient must be filled out, his amnesias must be abolished. Practically this amounts to the same thing. Therefore an important role in the development of his symptoms must be accredited to the amnesias of the neurotic. The analysis of our first case, however, will hardly justify this valuation of the amnesia. The patient has not forgotten the scene from which the compulsion act derives — on the contrary, she remembers it vividly, nor is there any other forgotten factor which comes into play in the development of these symptoms. Less clear, but entirely analogous, is the situation in the case of our second patient, the girl with the compulsive ritual. She, too, has not really forgotten the behavior of her early years, the fact that she insisted that the door between her bedroom and that of her parents be kept open, and that she banished her mother out of her place in her parents' bed. She recalls all this very clearly, although hesitatingly and unwillingly. Only one factor stands out strikingly in our first case, that though the patient carries out her compulsive act innumerable times, she is not once reminded of its similarity with the experience after the bridal-night; nor was this memory even suggested when by direct questions she was asked to search for its motivation. The same is true of the girl, for in her case not only her ritual, but the situation which provoked it, is repeated identically night after night. In neither case is there any actual amnesia, no lapse of memory, but an association is broken off which should have called out a reproduction, a revival in the memory. Such a disturbance is enough to bring on a compulsion neurosis. Hysteria, however, shows a different picture, for it is usually characterized by most grandiose amnesias. As a rule, in the analysis of each hysterical symptom, one is led back to a whole chain of impressions which, upon their recovery, are expressly designated as forgotten up to the moment. On

the one hand this chain extends back to the earliest years of life, so that the hysterical amnesias may be regarded as the direct continuation of the infantile amnesias, which hides the beginnings of our psychic life from those of us who are normal. On the other hand, we discover with surprise that the most recent experiences of the patient are blurred by these losses of memory — that especially the provocations which favored or brought on the illness are, if not entirely wiped out by the amnesia, at least partially obliterated. Without fail important details have disappeared from the general picture of such a recent memory, or are placed by false memories. Indeed it happens almost regularly that just before the completion of an analysis, certain memories of recent experiences suddenly come to light. They had been held back all this time, and had left noticeable gaps in the context.

We have pointed out that such a crippling of the ability to recall is characteristic of hysteria. In hysteria symptomatic conditions also arise (hysterical attacks) which need leave no trace in the memory. If these things do not occur in compulsion-neuroses, you are justified in concluding that these amnesias exhibit psychological characteristics of the hysterical change, and not a general trait of the neuroses. The significance of this difference will be more closely limited by the following observations. We have combined two things as the meaning of a symptom, its “whence,” on the one hand, and its “whither” or “why,” on the other. By these we mean to indicate the impressions and experiences whence the symptom arises, and the purpose the symptom serves. The “whence” of a symptom is traced back to impressions which have come from without, which have therefore necessarily been conscious at some time, but which may have sunk into the unconscious — that is, have been forgotten. The “why” of the symptom, its tendency, is in every case an endopsychic process, developed from within, which may or may not have become conscious at first, but could just as readily never have entered consciousness at all and have been unconscious from its inception. It is, after all, not so very significant that, as happens in the hysterias, amnesia has covered over the “whence” of the symptom, the experience upon which it is based; for it is the “why,” the tendency of the symptom, which establishes its dependence on the unconscious, and indeed no less so in the compulsion neuroses than in hysteria. In both cases the “why” may have been unconscious from the very first.

By thus bringing into prominence the unconscious in psychic life, we have raised the most evil spirits of criticism against psychoanalysis. Do not be surprised at this, and do not believe that the opposition is directed only against the difficulties offered by the conception of the unconscious or against the relative inaccessibility of the experiences which represent it. I believe it comes from another source. Humanity, in the course of time, has had to endure from the hands of science two great outrages against its naive self-love. The first was when humanity discovered that our earth was not the center of the universe, but only a tiny speck in a world-system hardly conceivable in its magnitude. This is associated in our minds with the name “Copernicus,” although Alexandrian science had taught much the same thing. The second occurred when biological research robbed man of his apparent superiority under special creation, and rebuked him with his descent from the animal kingdom, and his ineradicable animal nature. This re-valuation, under the influence of Charles Darwin, Wallace and their predecessors, was not accomplished without the most violent opposition of their contemporaries. But the third and most irritating insult is flung at the human mania of greatness by present-day psychological research, which wants to prove to the “I” that it is not even master in its own home, but is dependent upon the most scanty information concerning all that goes on unconsciously in its psychic life. We psychoanalysts were neither the first, nor the only ones to announce this admonition to look within ourselves. It appears that we are fated to represent it most insistently and to confirm it by means of empirical data which are of importance to every single person. This is the reason for the widespread revolt against our science, the omission of all considerations of academic urbanity, and emancipation of the opposition from all restraints of impartial logic. We were compelled to disturb the peace of the world, in addition, in another manner, of which you will soon come to know.

NINETEENTH LECTURE. GENERAL THEORY OF THE NEUROSES

Resistance and Suppression

IN order to progress in our understanding of the neuroses, we need new experiences and we are about to obtain two. Both are very remarkable and were at the time of their discovery, very surprising. You are, of course, prepared for both from our discussions of the past semester.

In the first place: When we undertake to cure a patient, to free him from the symptoms of his malady, he confronts us with a vigorous, tenacious resistance that lasts during the whole time of the treatment. That is so peculiar a fact that we cannot expect much credence for it. The best thing is not to mention this fact to the patient's relatives, for they never think of it otherwise than as a subterfuge on our part in order to excuse the length or the failure of our treatment. The patient, moreover, produces all the phenomena of this resistance without even recognizing it as such; it is always a great advance to have brought him to the point of understanding this conception and reckoning with it. Just consider, this patient suffers from his symptoms and causes those about him to suffer with him. He is willing, moreover, to take upon himself so many sacrifices of time, money, effort and self-denial in order to be freed. And yet he struggles, in the very interests of his malady, against one who would help him. How improbable this assertion must sound! And yet it is so, and if we are reproached with its improbability, we need only answer that this fact is not without its analogies. Whoever goes to a dentist with an unbearable toothache may very well find himself thrusting away the dentist's arm when the man makes for his sick tooth with a pair of pincers.

The resistance which the patient shows is highly varied, exceedingly subtle, often difficult to recognize, Protean-like in its manifold changes of form. It means that the doctor must become suspicious and be constantly on his guard against the patient. In psychoanalytic therapy we make use, as you know, of that technique which is already familiar to you from the interpretation of dreams. We tell the patient that without further reflection he should put himself into a condition of calm self-observation and that he must then communicate whatever results this introspection gives him — feelings, thoughts, reminiscences, in the order in which they appear to his

mind. At the same time, we warn him expressly against yielding to any motive which would induce him to choose or exclude any of his thoughts as they arise, in whatever way the motive may be couched and however it may excuse him from telling us the thought: “that is too unpleasant,” or “too indiscreet” for him to tell; or “it is too unimportant,” or “it does not belong here,” “it is nonsensical.” We impress upon him the fact that he must skim only across the surface of his consciousness and must drop the last vestige of a critical attitude toward that which he finds. We finally inform him that the result of the treatment and above all its length is dependent on the conscientiousness with which he follows this basic rule of the analytic technique. We know, in fact, from the technique of interpreting dreams, that of all the random notions which may occur, those against which such doubts are raised are invariably the ones to yield the material which leads to the uncovering of the unconscious.

The first reaction we call out by laying down this basic technical rule is that the patient directs his entire resistance against it. The patient tries in every way to escape its requirements. First he will declare that he cannot think of anything, then, that so much comes to his mind that it is impossible to seize on anything definite. Then we discover with no slight displeasure that he has yielded to this or that critical objection, for he betrays himself by the long pauses which he allows to occur in his speaking. He then confesses that he really cannot bring himself to this, that he is ashamed to; he prefers to let this motive get the upper hand over his promise. He may say that he did think of something but that it concerns someone else and is for that reason exempt. Or he says that what he just thought of is really too trivial, too stupid and too foolish. I surely could not have meant that he should take such thoughts into account. Thus it goes on, with untold variations, in the face of which we continually reiterate that “telling everything” really means telling everything.

One can scarcely find a patient who does not make the attempt to reserve some province for himself against the intrusion of the analysis. One patient, whom I must reckon among the most highly intelligent, thus concealed an intimate love relation for weeks; and when he was asked to explain this infringement of our inviolable rule, he defended his action with the argument that he considered this one thing was his private affair. Naturally, analytic treatment cannot countenance such right of sanctuary. One might as well try in a city like Vienna to allow an exception to be

made of great public squares like the Hohe Markt or the Stephans Platz and say that no one should be arrested in those places — and then attempt to round up some particular wrong-doer. He will be found nowhere but in those sanctuaries. I once brought myself around to permit such an exception in the case of a man on whose capacity for work a great deal depended, and who was bound by his oath of service, which forbade him to tell anyone of certain things. To be sure, he was satisfied with the results — but not I; I resolved never to repeat such an attempt under these conditions.

Compulsion neurotics are exceedingly adept at making this technical rule almost useless by bringing to bear all their over-conscientiousness and their doubts upon it. Patients suffering from anxiety-hysteria sometimes succeed in reducing it to absurdity by producing only notions so remote from the thing sought for that analysis is quite unprofitable. But it is not my intention to go into the way in which these technical difficulties may be met. It is enough to know that finally, by means of resolution and perseverance, we do succeed in wresting a certain amount of obedience from the patient toward this basic rule of the technique; the resistance then makes itself felt in other ways. It appears in the form of an intellectual resistance, battles by means of arguments, and makes use of all difficulties and improbabilities which a normal yet uninstructed thinking is bound to find in the theory of analysis. Then we hear from one voice alone the same criticisms and objections which thunder about us in mighty chorus in the scientific literature. Therefore the critics who shout to us from outside cannot tell us anything new. It is a veritable tempest in a teapot. Still the patient can be argued with, he is anxious to persuade us to instruct him, to teach him, to lead him to the literature, so that he may continue working things out for himself. He is very ready to become an adherent of psychoanalysis on condition that analysis spare him personally. But we recognize this curiosity as a resistance, as a diversion from our special objects, and we meet it accordingly. In those patients who suffer from compulsion neuroses, we must expect the resistance to display special tactics. They frequently allow the analysis to take its way, so that it may succeed in throwing more and more light on the problems of the case, but we finally begin to wonder how it is that this clearing up brings with it no practical progress, no diminution of the symptom. Then we may discover that the resistance has entrenched itself in the doubts of the

compulsion neurosis itself and in this position is able successfully to resist our efforts. The patient has said something like this to himself: “This is all very nice and interesting. And I would be glad to continue it. It would affect my malady considerably if it were true. But I don’t believe that it is true and as long as I don’t believe it, it has nothing to do with my sickness.” And so it may go on for a long time until one finally has shaken this position itself; it is then that the decisive battle takes place.

The intellectual resistances are not the worst, one can always get ahead of them. But the patient can also put up resistances, within the limits of the analysis, whose conquest belongs to the most difficult tasks of our technique. Instead of recalling, he actually goes again through the attitudes and emotions of his previous life which, by means of the so-called “transference,” can be utilized as resistances to the physician and the treatment. If the patient is a man, he takes this material as a rule from his relations to his father, in whose place he now puts the physician, and in so doing constructs a resistance out of his struggle for independence of person and opinion; out of his ambition to equal or to excel his father; out of his unwillingness to assume the burden of gratitude a second time in his life. For long times at a stretch one receives the impression that the patient desires to put the physician in the wrong and to let him feel his helplessness by triumphing over him, and that this desire has completely replaced his better intention of making an end to his sickness. Women are adepts at exploiting, for the purposes of the resistance, a tender, erotically tinged transference to the physician. When this leaning attains a certain intensity, all interest for the actual situation of the treatment is lost, together with every sense of the responsibility which was assumed by undertaking it. The never-failing jealousy as well as the embitterment over the inevitable repudiation, however gently effected, all must serve to spoil the personal understanding between patient and physician and thus to throw out one of the most powerful propelling forces of the analysis.

Resistances of this sort must not be narrow-mindedly condemned. They contain so much of the most important material of the patient’s past and reproduce it in such a convincing manner, that they become of the greatest aid to the analysis, if a skillful technique is able to turn them in the right direction. It is only remarkable that this material is at first always in the service of the resistance, for which it serves as a barrier against the treatment. One can also say that here are traits of character, adjustments of

the ego which were mobilized in order to defeat the attempted change. We are thus able to learn how these traits arose under the conditions of the neurosis, as a reaction to its demands, and to see features more clearly in this character which could otherwise not have shown up so clearly or at least not to this extent, and which one may therefore designate as latent. You must also not get the impression that we see an unforeseen endangering of the analytic influence in the appearance of these resistances. On the contrary, we know that these resistances must come to light; we are dissatisfied only when we do not provoke them in their full strength and so make them plain to the patient Indeed, we at last understand that overcoming these resistances is the essential achievement of analysis and is that portion of the work which alone assures us that we have accomplished something with the patient.

You must also take into account the fact that any accidental occurrences which arise during the treatment will be made use of by the patient as a disturbance — every diverting incident, every statement about analysis from an inimical authority in his circle, any chance illness or any organic affection which complicates the neurosis; indeed, he even uses every improvement of his condition as a motive for abating his efforts. You will then have gained an approximate, though still an incomplete picture of the forms and devices of the resistance which must be met and overcome in the course of every analysis. I have given this point such detailed consideration because I am about to inform you that our dynamic conception of the neurosis is based on this experience with the resistance of neurotic patients against the banishment of their symptoms. Breuer and I both originally practiced psycho-therapy by means of hypnosis. Breuer’s first patient was treated throughout under a condition of hypnotic suggestibility, and I at first followed his example. I admit that my work at that time progressed easily and agreeably and also took much less time. But the results were capricious and not permanent; therefore I finally gave up hypnotism. Then only did I realize that no insight into the forces which produce these diseases was possible as long as one used hypnotism. The condition of hypnosis could prevent the physician from realizing the existence of a resistance. Hypnosis drives back the resistance and frees a certain field for the work of analysis, but similarly to the doubt in the compulsion neurosis, in so doing it clogs the boundaries of this field till

they become impenetrable. That is why I can say that true psychoanalysis began when the help of hypnotism was renounced.

But if the establishment of the resistance thus becomes a matter of such importance, then surely we must give our caution full rein, and follow up any doubts as to whether we are not all too ready in our assumption of their existence. Perhaps there really are neurotic cases in which associations appear for other reasons, perhaps the arguments against our hypothesis really deserve more consideration and we are unjustified in conveniently rejecting all intellectual criticisms of analysis as a resistance. Indeed, ladies and gentlemen, but our judgment was by no means readily arrived at. We had opportunity to observe every critical patient from the first sign of the resistance till after its disappearance. In the course of the treatment, the resistance is moreover constantly changing in intensity. It is always on the increase as we approach a new theme, is strongest at the height of its elaboration, and dies down again when this theme has been abandoned. Furthermore, unless we have made some unusual and awkward technical error, we never have to deal with the full measure of resistance of which the patient is capable. We could therefore convince ourselves that the same man took up and discarded his critical attitude innumerable times in the course of the analysis. Whenever we are on the point of bringing before his consciousness some piece of unconscious material which is especially painful to him, then he is critical in the extreme. Even though he had previously understood and accepted a great deal, nevertheless all record of these gains seems now to have been wiped out. He may, in his desire to resist at any cost, present a picture of veritable emotional feeblemindedness. If one succeeds in helping him to overcome this new resistance, then he regains his insight and his understanding. Thus his criticism is not an independent function to be respected as such; it plays the role of handy-man to his emotional attitude and is guided by his resistance. If something displeases him, he can defend himself against it very ingeniously and appear most critical. But if something strikes his fancy, then he may show himself easily convinced. Perhaps none of us are very different, and the patient under analysis shows this dependence of the intellect on the emotional life so plainly only because, under the analysis, he is so hard pressed.

In what way shall we now account for the observation that the patient so energetically resists our attempts to rid him of his symptoms and to

make his psychic processes function in a normal way? We tell ourselves that we have here come up against strong forces which oppose any change in the condition; furthermore, that these forces must be identical with those which originally brought about the condition. Some process must have been functional in the building up of these symptoms, a process which we can now reconstruct by means of our experiences in solving the meaning of the symptoms. We already know from Breuer's observations that the existence of a symptom presupposes that some psychic process was not carried to its normal conclusion, so that it could not become conscious. The symptom is the substitute for that which did not take place. Now we know where the forces whose existence we suspect must operate. Some violent antagonism must have been aroused to prevent the psychic process in question from reaching consciousness, and it therefore remained unconscious. As an unconscious thought it had the power to create a symptom. The same struggle during the analytic treatment opposes anew the efforts to carry this unconscious thought over into consciousness. This process we felt as a resistance. That pathogenic process which is made evident to us through the resistance, we will name *repression*.

We are now ready to obtain a more definite idea of this process of repression. It is the preliminary condition for the formation of symptoms; it is also a thing for which we have no parallel. If we take as prototype an impulse, a psychological process which is striving to convert itself into action, we know that it may succumb before a rejection, which we call "repudiation" or "condemnation." In the course of this struggle, the energy which the impulse had at its disposal was withdrawn from it, it becomes powerless; yet it may subsist in the form of a memory. The whole process of decision occurs with the full knowledge of the ego. The state of affairs is very different if we imagine that this same impulse has been subjected to repression. In that case, it would retain its energy and there would be no memory of it left; in addition, the process of repression would be carried out without the knowledge of the ego. Through this comparison, however, we have come no nearer understanding the nature of repression.

I now go into the theoretical ideas which alone have shown themselves useful in making the conception of repression more definite. It is above all necessary that we progress from a purely descriptive meaning of the word "unconscious" to its more systematic meaning; that is, we come to a point

where we must call the consciousness or unconsciousness of a psychic process only one of its attributes, an attribute which is, moreover, not necessarily unequivocal. If such a process remained unconscious, then this separation from consciousness is perhaps only an indication of the fate to which it has submitted and not this fate itself. To bring this home to us more vividly, let us assume that every psychological process — with one exception, which I will go into later — first exists in an unconscious state or phase and only goes over from this into a conscious phase, much as a photographic picture is first a negative and then becomes a picture by being printed. But not every negative need become a positive, and just as little is it necessary that every unconscious psychological process should be changed into a conscious one. We find it advantageous to express ourselves as follows: Any particular process belongs in the first place to the psychological system of the unconscious; from this system it can under certain conditions go over into the system of the conscious. The crudest conception of these systems is the one which is most convenient for us, namely, a representation in space. We will compare the system of the unconscious to a large ante-chamber, in which the psychic impulses rub elbows with one another, as separate beings. There opens out of this ante-chamber another, a smaller room, a sort of parlor, which consciousness occupies. But on the threshold between the two rooms there stands a watchman; he passes on the individual psychic impulses, censors them, and will not let them into the parlor if they do not meet with his approval. You see at once that it makes little difference whether the watchman brushes a single impulse away from the threshold, or whether he drives it out again after it has already entered the parlor. It is a question here only of the extent of his watchfulness, and the timeliness of his judgment. Still working with this simile, we proceed to a further elaboration of our nomenclature. The impulses in the ante-chamber of the unconscious cannot be seen by the conscious, which is in the other room; therefore for the time being they must remain unconscious. When they have succeeded in pressing forward to the threshold, and have been sent back by the watchman, then they are unsuitable for consciousness and we call them *suppressed*. Those impulses, however, which the watchman has permitted to cross the threshold have not necessarily become conscious; for this can happen only if they have been successful in attracting to themselves the glance of the conscious. We therefore justifiably call this

second room the system of the *fore-conscious*. In this way the process of becoming conscious retains its purely descriptive sense. Suppression then, for any individual impulse, consists in not being able to get past the watchman from the system of the unconscious to that of the fore-conscious. The watchman himself is long since known to us; we have met him as the resistance which opposed us when we attempted to release the suppression through analytic treatment.

Now I know you will say that these conceptions are as crude as they are fantastic, and not at all permissible in a scientific discussion. I know they are crude — indeed, we even know that they are incorrect, and if we are not very much mistaken we have a better substitute for them in readiness. Whether they will continue then to appear so fantastic to you I do not know. For the time being, they are useful conceptions, similar to the manikin *Ampère* who swims in the stream of the electric current. In so far as they are helpful in the understanding of our observation, they are by no means to be despised. I should like to assure you that these crude assumptions go far in approximating the actual situation — the two rooms, the watchman on the threshold between the two, and consciousness at the end of the second room in the role of an onlooker. I should also like to hear you admit that our designations — *unconscious*, *fore-conscious*, and *conscious* are much less likely to arouse prejudice, and are easier to justify than others that have been used or suggested — such as *sub-conscious*, *inter-conscious*, *between-conscious*, etc.

This becomes all the more important to me if you should warn me that this arrangement of the psychic apparatus, such as I have assumed in the explanation of neurotic symptoms, must be generally applicable and must hold for normal functioning as well. In that, of course, you are right. We cannot follow this up at present, but our interest in the psychology of the development of the symptom must be enormously increased if through the study of pathological conditions we have the prospect of finding a key to the normal psychic occurrences which have been so well concealed.

You will probably recognize what it is that supports our assumptions concerning these two systems and their relation to consciousness. The watchman between the unconscious and the fore-conscious is none other than the censor under whose control we found the manifest dream to obtain its form. The residue of the day’s experiences, which we found were the stimuli which set off the dream, are fore-conscious materials which at

night, during sleep, had come under the influence of unconscious and suppressed wishes. Borne along by the energy of the wish, these stimuli were able to build the latent dream. Under the control of the unconscious system this material was worked over, went through an elaboration and displacement such as the normal psychic life or, better said, the fore-conscious system, either does not know at all or tolerates only exceptionally. In our eyes the characteristics of each of the two systems were betrayed by this difference in their functioning. The dependent relation between the fore-conscious and the conscious was to us only an indication that it must belong to one of the two systems. The dream is by no means a pathological phenomenon; it may appear in every healthy person under the conditions of sleep. Any assumption as to the structure of the psychic apparatus which covers the development of both the dream and the neurotic symptom has also an undeniable claim to be taken into consideration in any theory of normal psychic life.

So much, then, for suppression. It is, however, only a prerequisite for the evolution of the symptom. We know that the symptom serves as a substitute for a process kept back by suppression. Yet it is no simple matter to bridge this gap between the suppression and the evolution of the substitute. We have first to answer several questions on other aspects of the problem concerning the suppression and its substantiation: What kind of psychological stimuli are at the basis of the suppression; by what forces is it achieved; for what motives? On these matters we have only one insight that we can go by. We learned in the investigation of resistance that it grows out of the forces of the “I,” in other words from obvious and latent traits of character. It must be from the same traits also that suppression derived support; at least they played a part in its development. All further knowledge is still withheld from us.

A second observation, for which I have already prepared, will help us further at this point. By means of analysis we can assign one very general purpose to the neurotic symptom. This is of course nothing new to you. I have already shown it to you in the two cases of neuroses. But, to be sure, what is the significance of two cases! You have the right to demand that it be shown to you innumerable times. But I am unable to do this. Here again your own experience must step in, or your belief, which may in this matter rely upon the unanimous account of all psychoanalysts.

You will remember that in these two cases, whose symptoms we subjected to searching investigation, the analysis introduced us to the most intimate sexual life of these patients. In the first case, moreover, we could identify with unusual clearness the purpose or tendency of the symptoms under investigation. Perhaps in the second case it was slightly covered by another factor — one we will consider later. Now, the same thing that we saw in these two examples we would see in all other cases that we subjected to analysis. Each time, through analysis, we would be introduced to the sexual wishes and experiences of the patient, and every time we would have to conclude that their symptoms served the same purpose. This purpose shows itself to be the satisfaction of sexual wishes; the symptoms serve as a sexual satisfaction for the patient, they are a substitute for such satisfactions as they miss in reality.

Recall the compulsive act of our first patient. The woman longs for her intensely beloved husband, with whom she cannot share her life because of his shortcoming and weaknesses. She feels she must remain true to him, she can give his place to no one else. Her compulsive symptom affords her that for which she pines, ennobles her husband, denies and corrects his weaknesses, — above all, his impotence. This symptom is fundamentally a wish-fulfillment, exactly as is a dream; moreover, it is what a dream not always is, an erotic wish-fulfillment. In the case of our second patient you can see that one of the component purposes of her ceremonial was the prevention of the intercourse of her parents or the hindrance of the creation of a new child thereby. You have perhaps also guessed that essentially she strove to put herself in the place of her mother. Here again we find the removal of disturbances to sexual satisfaction and the fulfillment of personal sexual wishes. We shall soon turn to the complications of whose existence we have given you several indications.

I do not want to make reservations as to the universal applicability of these declarations later on, and therefore I wish to call to your attention the fact that everything that I say here about suppression, symptom-development and symptom-interpretation has been learned from three types of neuroses — anxiety-hysteria, conversion-hysteria, and compulsion-neuroses — and for the time being is relevant to these forms only. These three conditions, which we are in the habit of combining into one group under the name of "*transference neuroses*," also limit the field open to psychoanalytic therapy. The other neuroses have not been nearly

so well studied by psychoanalysis, — in one group, in fact, the impossibility of therapeutic influence has been the reason for the neglect. But you must not forget that psychoanalysis is still a very young science, that it demands much time and care in preparation for it, that not long ago it was still in the cradle, so to speak. Yet at all points we are about to penetrate into the understanding of those other conditions which are not transference neuroses. I hope I shall still be able to speak to you of the developments that our assumptions and results have undergone by being correlated with this new material, and to show you that these further studies have not led to contradictions but rather to the production of still greater uniformity. Granted that everything, then, that has been said here, holds good for the three transference neuroses, allow me to add a new bit of information to the evaluation of its symptoms. A comparative investigation into the causes of the disease discloses a result that may be confined into the formula: in some way or other these patients fell ill through *self-denial* when reality withheld from them the satisfaction of their sexual wishes. You recognize how excellently well these two results are found to agree. The symptoms must be understood, then, as a substitute satisfaction for that which is missed in life.

To be sure, there are all kinds of objections possible to the declaration that neurotic symptoms are substitutes for sexual satisfaction. I shall still go into two of them today. If you yourself have analytically examined a fairly large number of neurotics you will perhaps gravely inform me that in one class of cases this is not at all applicable, the symptoms appear rather to have the opposite purpose, to exclude sexual satisfaction, or discontinue it. I shall not deny the correctness of your interpretation. The psychoanalytic content has a habit of being more complicated than we should like to have it. Had it been so simple, perhaps we should have had no need for psychoanalysis to bring it to light. As a matter of fact, some of the traits of the ceremonial of our second patient may be recognized as of this ascetic nature, inimical to sexual satisfaction; for example, the fact that she removes the clocks, which have the magic qualities of preventing nightly erections, or that she tries to prevent the falling and breaking of vessels, which symbolizes a protection of her virginity. In other cases of bed-ceremonials which I was able to analyze, this negative character was far more evident; the ceremonial might consist throughout of protective regulations against sexual recollections and temptations. On the other

hand, we have often discovered in psychoanalysis that opposites do not mean contradictions. We might extend our assertion and say the symptoms purpose either a sexual satisfaction or a guard against it; that in hysteria the positive wish-fulfillment takes precedence, while in the compulsion neuroses the negative, ascetic characteristics have the ascendancy. We have not yet been able to speak of that aspect of the mechanism of the symptoms, their two-sidedness, or polarity, which enables them to serve this double purpose, both the sexual satisfaction and its opposite. The symptoms are, as we shall see, compromise results, arising from the integration of two opposed tendencies; they represent not only the suppressed force but also the suppressing factor, which was originally potent in bringing about the negation. The result may then favor either one side or the other, but seldom is one of the influences entirely lacking. In cases of hysteria, the meeting of the two purposes in the same symptom is most often achieved. In compulsion-neuroses, the two parts often become distinct; the symptom then has a double meaning, it consists of two actions, one following the other, one releasing the other. It will not be so easy to put aside a further misgiving. If you should look over a large number of symptom-interpretations, you would probably judge offhand that the conception of a sexual substitute-satisfaction has been stretched to its utmost limits in these cases. You will not hesitate to emphasize that these symptoms offer nothing in the way of actual satisfaction, that often enough they are limited to giving fresh life to sensations or phantasies from some sexual complex. Further, you will declare that the apparent sexual satisfaction so often shows a childish and unworthy character, perhaps approximates an act of onanism, or is reminiscent of filthy naughtiness, habits that are already forbidden and broken in childhood. Finally, you will express your surprise that one should designate as a sexual satisfaction appetites which can only be described as horrible or ghastly, even unnatural. As to these last points, we shall come to no agreement until we have submitted man’s sexual life to a thorough investigation, and thus ascertained what one is justified in calling sexual.

TWENTIETH LECTURE. GENERAL THEORY OF THE NEUROSES

The Sexual Life of Man

ONE might think we could take for granted what we are to understand by the term “sexual.” Of course, the sexual is the indecent, which we must not talk about. I have been told that the pupils of a famous psychiatrist once took the trouble to convince their teacher that the symptoms of hysteria very frequently represent sexual matters. With this intention they took him to the bedside of a woman suffering from hysteria, whose attacks were unmistakable imitations of the act of delivery. He, however, threw aside their suggestion with the remark, “a delivery is nothing sexual.” Assuredly, a delivery need not under all circumstances be indecent.

I see that you take it amiss that I jest about such serious matters. But this is not altogether a jest. In all seriousness, it is not altogether easy to define the concept “sexual.” Perhaps the only accurate definition would be everything that is connected with the difference between the two sexes; but this you may find too general and too colorless. If you emphasize the sexual act as the central factor, you might say that everything is sexual which seeks to obtain sensual excitement from the body and especially from the sexual organs of the opposite sex, and which aims toward the union of the genitals and the performance of the sexual act. But then you are really very close to the comparison of sexual and indecent, and the act of delivery is not sexual. But if you think of the function of reproduction as the nucleus of sexuality you are in danger of excluding a number of things that do not aim at reproduction but are certainly sexual, such as onanism or even kissing. But we are prepared to realize that attempts at definition always lead to difficulties; let us give up the attempt to achieve the unusual in our particular case. We may suspect that in the development of the concept “sexual” something occurred which resulted in a false disguise. On the whole, we are quite well oriented as to what people call sexual.

The inclusion of the following factors in our concept “sexual” amply suffices for all practical purposes in ordinary life: the contrast between the sexes, the attainment of sexual excitement, the function of reproduction, the characteristic of an indecency that must be kept concealed. But this is

no longer satisfactory to science. For through careful examinations, rendered possible only by the sacrifices and the unselfishness of the subjects, we have come in contact with groups of human beings whose sexual life deviates strikingly from the average. One group among them, the “perverse,” have, as it were, crossed off the difference between the sexes from their program. Only the same sex can arouse their sexual desires; the other sex, even the sexual parts, no longer serve as objects for their sexual desires, and in extreme cases, become a subject for disgust. They have to that extent, of course, foregone any participation in reproduction. We call such persons homosexual or inverted. Often, though not always, they are men and women of high physical, intellectual and ethical development, who are affected only with this one portentous abnormality. Through their scientific leaders they proclaim themselves to be a special species of mankind, “a third sex,” which shares equal rights with the two other sexes. Perhaps we shall have occasion to examine their claims critically. Of course they are not, as they would like to claim, the “elect” of humanity, but comprise just as many worthless second-rate individuals as those who possess a different sexual organization.

At any rate, this type among the perverse seek to achieve the same ends with the object of their desires as do normal people. But in the same group there exists a long succession of abnormal individuals whose sexual activities are more and more alien to what seems desirable to the sensible person. In their manifold strangeness they seem comparable only to the grotesque freaks that P. Breughel painted as the temptation of Saint Anthony, or the forgotten gods and believers that G. Flaubert pictures in the long procession that passes before his pious penitent. This ill-assorted array fairly clamors for orderly classification if it is not to bewilder our senses. We first divide them, on the one hand, into those whose sexual object has changed, as is the case with homosexualists, and, on the other, those whose sexual aim has changed. Those of the first group have dispensed with the mutual union of the genital organs, and have, as one of the partners of the act, replaced the genitals by another organ or part of the body; they have thus overcome both the short-comings of organic structure and the usual disgust involved. There are others of this group who still retain the genitals as their object, but not by virtue of their sexual function; they participate for anatomic reasons or rather by reason of their proximity. By means of these individuals we realize that the functions of

excretion, which in the education of the child are hushed away as indecent, still remain capable of drawing complete sexual interest on themselves. There are still others who have relinquished the genitals entirely as an objective, have raised another part of the body to serve as the goal of their desire; the woman's breast, the foot, the tress of hair. There are also the fetishists, to whom the body part means nothing, who are gratified by a garment, a piece of white linen, a shoe. And finally there are persons who seek the whole object but with certain peculiar or horrible demands: even those who covet a defenseless corpse for instance, which they themselves must criminally compel to satisfy their desire. But enough of these horrors.

Foremost in the second grouping are those perverted ones who have placed as the end of their sexual desire performances normally introductory or preparatory to it. They satisfy their desire by their eyes and hands. They watch or attempt to watch the other individual in his most intimate doings, or uncover those portions of their own bodies which they should conceal in the vague expectation of being rewarded by a similar procedure on the other person's part. Here also belong the enigmatic sadists, whose affectionate strivings know no other goal than to cause their object pain and agony, varying all the way from humiliating suggestions to the harshest physical ill-treatment. As if to balance the scale, we have on the other hand the masochists, whose sole satisfaction consists in suffering every variety of humiliation and torture, symbolic and real, at the hands of the beloved one. There are still others who combine and confuse a number of these abnormal conditions. Moreover, in both these groups there are those who seek sexual satisfaction in reality, and others who are content merely to imagine such gratification, who need no actual object at all, but can supplant it by their own fantastic creations.

There can be not the least doubt that the sexual activities of these individuals are actually found in the absurdities, caprices and horrors that we have examined. Not only do they themselves conceive them as adequate substitutes, but we must recognize that they take the same place in their lives that normal sex gratification occupies in ours, and for which they bring the same sacrifices, often incommensurate with their ends. It is perfectly possible to trace along broad lines as well as in detail in what way these abnormalities follow the normal procedure and how they diverge from it. You will also find the characteristic of indecency which

belongs to the sexual act in these vagaries, only that it is therein magnified to the disreputable.

Ladies and gentlemen, what attitude are we to assume to these unusual varieties of sex gratification? Nothing at all is achieved by the mere expression of indignation and personal disgust and by the assurance that we do not share these lusts. That is not our concern. We have here a field of observation like any other. Moreover, the evasion that these persons are merely rarities, curiosities, is easily refuted. On the contrary, we are dealing with very frequent and widespread phenomena. If, however, we are told that we must not permit them to influence our views on sexual life, since they are all aberrations of the sexual instinct, we must meet this with a serious answer. If we fail to understand these abnormal manifestations of sexuality and are unable to relate them to the normal sexual life, then we cannot understand normal sexuality. It is, in short, our unavoidable task to account theoretically for all the potentialities of the perversions we have gone over and to explain their relation to the so-called normal sexuality.

A penetrating insight due to Ivan Bloch and two new experimental results will help us in this task. Bloch takes exception to the point of view which sees in a perversion a “sign of degeneration”; he proves that such deviations from the aim of the sexual instinct, such loose relations to the object of sexuality, have occurred at all times, among the most primitive and the most highly civilized peoples, and have occasionally achieved toleration and general recognition. The two experimental results were obtained in the course of psychoanalytic investigations of neurotics; they will undoubtedly exert a decided influence on our conceptions of sexual perversion.

We have stated that the neurotic symptoms are substitutions for sexual satisfactions, and I have given you to understand that the proof of this assertion by means of the analysis of symptoms encounters many difficulties. For this statement is only justifiable if, under the term “sexual satisfactions,” we include the so-called perverse sexual ends, since with surprising frequency we find symptoms which can be interpreted only in the light of their activity. The claim of rareness made by the homosexualists or the inverted immediately collapses when we learn that in the case of no single neurotic do we fail to obtain evidence of homosexual tendencies, and that in a considerable number of symptoms we find the expression of this latent inversion. Those who call themselves

homosexualists are the conscious and manifest inverts, but their number is as nothing before the latent homosexualists. We are forced to regard the desire for an object of one's own sex as a universal aberration of erotic life and to cede increasing importance to it. Of course the differences between manifest homosexuality and the normal attitude are not thus erased; their practical importance persists, but their theoretic value is greatly decreased. Paranoia, a disturbance which cannot be counted among the transference-neuroses, must in fact be assumed as arising regularly from the attempt to ward off powerful homosexual tendencies. Perhaps you will recall that one of our patients under her compulsive symptoms acted the part of a man, namely that of her own estranged husband; the production of such symptoms, impersonating the actions of men, is very common to neurotic women. Though this cannot be ascribed directly to homosexuality, it is certainly concerned with its prerequisites.

You are probably acquainted with the fact that the neurosis of hysteria may manifest its symptoms in all organic systems and may therefore disturb all functions. Analysis shows that in these symptoms there are expressed all those tendencies termed perverse, which seek to represent the genitals through other organs. These organs behave as substitute genitals; through the study of hysteric symptoms we have come to the conclusion that aside from their functional activities, the organs of the body have a sexual significance, and that the performance of their functions is disturbed if the sexual factor claims too much attention. Countless sensations and innervations, which appear as symptoms of hysteria, in organs apparently not concerned with sexuality, are thus discovered as bound up with the fulfillment of perverse sexual desires through the transference of sex instincts to other organs. These symptoms bring home to us the extent to which the organs used in the consumption of food and in excretion may become the bearers of sexual excitement. We see repeated here the same picture which the perversions have openly and unmistakably lain before us; in hysteria, however, we must make the detour of interpreting symptoms, and in this case the perverse sexual tendencies must be ascribed not to the conscious but to the unconscious life of the individual.

Among the many symptoms manifested in compulsion neurosis, the most important are those produced by too powerful sadistic tendencies, i.e., sexual tendencies with perverted aim. These symptoms, in accordance

with the structure of compulsion neurosis, serve primarily as a rejection of these desires, or they express a struggle between satisfaction and rejection. In this struggle, the satisfaction is never excessively curtailed; it achieves its results in the patient's behavior in a roundabout way, by preference turning against his own person in self-inflicted torture. Other forms of neurosis, characterized by intensive worry, are the expression of an exaggerated sexualization of acts that are ordinarily only preparatory to sexual satisfactions; such are the desires to see, to touch, to investigate. Here is thus explained the great importance of the fear of contact and also of the compulsion to wash. An unbelievably large portion of compulsion acts may, in the form of disguised repetitions and modifications, be traced back to onanism, admittedly the only uniform action which accompanies the most varied flights of the sexual imagination.

It would cost me very little effort to interweave far more closely the relation between perversion and neurosis, but I believe that what I have said is sufficient for our purposes. We must avoid the error of overestimating the frequency and intensity of perverse inclinations in the light of these interpretations of symptoms. You have heard that a neurosis may develop from the denial of normal sexual satisfactions. Through this actual denial the need is forced into the abnormal paths of sex excitement. You will later obtain a better insight into the way this happens. You certainly understand, that through such "*collateral*" hindrance, the perverse tendencies must become more powerful than they would have been if no actual obstacle had been put in the way of a normal sexual satisfaction. As a matter of fact, a similar influence may be recognized in manifest perversions. In many cases, they are provoked or motivated by the fact that too great difficulties stand in the way of normal sexual satisfactions, owing to temporary circumstances or to the permanent institutions of society. In other cases, to be sure, the perverse tendencies are entirely independent of such conditions; they are, as it were, the normal kind of sexual life for the individual in question.

Perhaps you are momentarily under the impression that we have confused rather than clarified the relation between normal and perverse sexuality. But keep in mind this consideration. If it is true that a hindrance or withholding of normal sexual satisfaction will bring out perverse tendencies in persons who have not previously shown them, we must assume that these persons must have harbored tendencies akin to

perversities — or, if you will, perversities in latent form. This brings us to the second experimental conclusion of which I spoke, namely, that psychoanalytic investigation found it necessary to concern itself with the sexual life of the child, since, in the analysis of symptoms, reminiscences and ideas reverted to the early years of childhood. Whatever we revealed in this manner was corroborated point by point through the direct observation of children. The result was the recognition that all inclinations to perversion have their origin in childhood, that children have tendencies toward them all and practice them in a measure corresponding to their immaturity. Perverse sexuality, in brief, is nothing more than magnified infantile sexuality divided into its separate tendencies.

Now you will certainly see these perversions in another light and no longer ignore their relation to the sexual life of man, at the cost, I do not doubt, of surprises and incongruities painful to your emotions. At first you will undoubtedly be disposed to deny everything — the fact that children have something which may be termed sexual life, the truth of our observations and the justification of our claim to see in the behavior of children any relation to what is condemned in later years as perversity. Permit me first to explain to you the cause of your reluctance and then to present to you the sum of our observations. It is biologically improbable, even absurd, to assume that children have no sexual life — sexual excitements, desires, and some sort of satisfaction — but that they develop it suddenly between the ages of twelve and fourteen. This would be just as improbable from the viewpoint of biology as to say that they were not born with genitals but developed them only in the period of puberty. The new factor which becomes active in them at the time is the function of reproduction, which avails itself for its own purposes of all the physical and psychic material already present. You commit the error of confusing sexuality with reproduction and thereby block the road to the understanding of sexuality, and of perversions and neuroses as well. This error is a prejudice. Oddly enough its source is the fact that you yourselves were children, and as children succumbed to the influence of education. One of the most important educational tasks which society must assume is the control, the restriction of the sexual instinct when it breaks forth as an impulse toward reproduction; it must be subdued to an individual will that is identical with the mandates of society. In its own interests, accordingly, society would postpone full development until the child has reached a

certain stage of intellectual maturity, for education practically ceases with the complete emergence of the sexual impulse. Otherwise the instinct would burst all bounds and the work of culture, achieved with such difficulty, would be shattered. The task of restraining this sexuality is never easy; it succeeds here too poorly and there too well. The motivating force of human society is fundamentally economic; since there is not sufficient nourishment to support its members without work on their part, the number of these members must be limited and their energies diverted from sexual activity to labor. Here, again, we have the eternal struggle for life that has persisted from prehistoric times to the present.

Experience must have shown educators that the task of guiding the sexual will of the new generation can be solved only by influencing the early sexual life of the child, the period preparatory to puberty, not by awaiting the storm of puberty. With this intention almost all infantile sex activities are forbidden to the child or made distasteful to him; the ideal goal has been to render the life of the child asexual. In the course of time it has really come to be considered asexual, and this point of view has actually been proclaimed by science. In order not to contradict our belief and intentions, we ignore the sexual activity of the child — no slight thing, at that — or are content to interpret it differently. The child is supposed to be pure and innocent, and whoever says otherwise may be condemned as a shameless blasphemer of the tender and sacred feelings of humanity.

The children are the only ones who do not join in carrying out these conventions, who assert their animal rights, who prove again and again that the road to purity is still before them. It is strange that those who deny the sexuality of children, do not therefore slacken in their educational efforts but rather punish severely the manifestations of the very thing they maintain does not exist, and call it “childish naughtiness.” Theoretically it is highly interesting to observe that the period of life which offers most striking evidence against the biased conception of asexual childhood, is the time up to five or six years of age; after that everything is enveloped by a veil of amnesia, which is rent apart only by thorough scientific investigation; it may previously have given way partially in certain forms of dreams.

Now I shall present to you what is most easily recognizable in the sexual life of the child. At first, for the sake of convenience let me explain to you the conception of the libido. Libido, analogous to hunger, is the

force through which the instinct, here the sex instinct (as in the case of hunger it is the instinct to eat) expresses itself. Other conceptions, such as sexual excitement and satisfaction, require no elucidation. You will easily see that interpretation plays the greatest part in disclosing the sexuality of the suckling; in fact you will probably cite this as an objection. These interpretations proceed from a foundation of analytic investigation that trace backwards from a given symptom. The suckling reveals the first sexual impulses in connection with other functions necessary for life. His chief interest, as you know, is directed toward the taking in of food; when it has fallen asleep at its mother's breast, fully satisfied, it bears the expression of blissful content that will come back again in later life after the experience of the sexual orgasm. That of course would be too slight evidence to form the basis of a conclusion. But we observe that the suckling wishes to repeat the act of taking in food without actually demanding more food; he is therefore no longer urged by hunger. We say he is sucking, and the fact that after this he again falls asleep with a blissful expression shows us that the act of sucking in itself has yielded him satisfaction. As you know, he speedily arranges matters so that he cannot fall asleep without sucking. Dr. Lindner, an old pediatrist in Budapest, was the first one to ascertain the sexual nature of this procedure. Persons attending to the child, who surely make no pretensions to a theoretic attitude, seem to judge sucking in a similar manner. They do not doubt that it serves a pleasurable satisfaction, term it naughty, and force the child to relinquish it against his will, and if he will not do so of his own accord, through painful measures. And so we learn that the suckling performs actions that have no object save the obtaining of a sensual gratification. We believe that this gratification is first experienced during the taking in of food, but that he speedily learns to separate it from this condition. The gratification can only be attributed to the excitation of the mouth and lips, hence we call these parts of the body *erogenous zones* and the pleasure derived from sucking, *sexual*. Probably we shall have to discuss the justification of this name.

If the suckling could express himself, he would probably recognize the act of sucking at his mother's breast as the most important thing in life. He is not so far wrong, for in this one act he satisfies two great needs of life. With no small degree of surprise we learn through psychoanalysis how much of the physical significance of this act is retained through life. The

sucking at the mother's breast becomes the term of departure for all of sexual life, the unattained ideal of later sex gratification, to which the imagination often reverts in times of need. The mother's breast is the first object for the sexual instinct; I can scarcely bring home to you how significant this object is for centering on the sexual object in later life, what profound influence it exerts upon the most remote domains of psychic life through evolution and substitution. The suckling, however, soon relinquishes it and fills its place by a part of his own body. The child sucks his thumb or his own tongue. Thereby he renders himself independent of the consent of the outer world in obtaining his sensual satisfactions, and moreover increases the excitement by including a second zone of his body. The erogenous zones are not equally satisfactory; it is therefore an important experience when, as Dr. Lindner puts it, the child while touching his own body discovers the especially excitable genitals, and so finds the way from sucking to onanism.

Through the evaluation of sucking we become acquainted with two decisive characteristics of infantile sexuality. It arises in connection with the satisfaction of great organic needs and behaves *auto-erotically*, that is to say, it seeks and finds it objects on its own body. What is most clearly discernible during the taking in of food is partially repeated during excretion. We conclude that the nursling experiences pleasure during the excretion of urine and the contents of the intestine and that he soon strives to arrange these acts in a way to secure the greatest possible amount of satisfaction by the corresponding excitement of the erogenous membrane zones. Lou Andreas, with her delicate perceptions, has shown how at this point the outer world first intervenes as a hindrance, hostile to the child's desire for satisfaction — the first vague suggestion of outer and inner conflicts. He may not let his excretions pass from him at a moment agreeable to him, but only when other persons set the time. To induce him to renounce these sources of satisfaction, everything relating to these functions is declared indecent and must be concealed. Here, for the first time, he is to exchange pleasure for social dignity. His own relation to his excretions is originally quite different. He experiences no disgust toward his faeces, values them as a part of his body from which he does not part lightly, for he uses them as the first "present" he can give to persons he esteems particularly. Even after education has succeeded in alienating him from these tendencies, he transfers the evaluation of the faeces to the

“present” and to “money.” On the other hand, he appears to regard his achievements in urination with especial pride.

I know that you have been wanting to interrupt me for a long time and to cry: “Enough of these monstrosities! Excretion a source of sexual gratification that even the suckling exploits! Faeces a valuable substance! The anus a sort of genital! We do not believe it, but we understand why children’s physicians and pedagogues have decidedly rejected psychoanalysis and its results.” No, you have merely forgotten that it was my intention to present to you infantile sexuality in connection with the facts of sexual perversion. Why should you not know that in the case of many grown-ups, homosexuals as well as heterosexuals, the locus of intercourse is transferred from the normal to a more remote portion of the body. And that there are many individuals who confess to a pleasurable sensation of no slight degree in the emptying of the bowels during their entire lives! Children themselves will confirm their interest in the act of defecation and the pleasure in watching the defecation of another, when they are a few years older and capable of giving expression to their feelings. Of course, if these children have previously been systematically intimidated, they will understand all too well the wisdom of preserving silence on the subject. As for the other things that you do not wish to believe, let me refer you to the results of analysis and the direct observation of children, and you will realize that it is difficult not to see these things or to see them in a different light. I do not even object to making the relation between child-sexuality and sexual perversion quite obvious to you. It is really only natural; if the child has sexual life at all, it must necessarily be perverse, because aside from a few hazy illusions, the child does not know how sexuality gives rise to reproduction. The common characteristic of all perversions, on the other hand, is that they have abandoned reproduction as their aim. We term sexual activity perverse when it has renounced the aim of reproduction and follows the pursuit of pleasure as an independent goal. And so you realize that the turning point in the development of sexual life lies in its subjugation to the purpose of reproduction. Everything this side of the turning point, everything that has given up this purpose and serves the pursuit of pleasure alone, must carry the term “perverse” and as such be regarded with contempt.

Permit me, therefore, to continue with my brief presentation of infantile sexuality. What I have told you about two organic systems I could supplement by a discussion of all the others. The sexual life of the child exhausts itself in the exercise of a series of partial instincts which seek, independently of one another, to gain satisfaction from his own body or from an external object. Among these organs the genitals speedily predominate. There are persons who continue the pursuit of satisfaction by means of their own genitals, without the aid of another genital or object, uninterruptedly from the onanism of the suckling to the onanism of necessity which arises in puberty, and even indefinitely beyond that. The theme of onanism alone would occupy us for a long period of time; it offers material for diverse observations.

In spite of my inclination to shorten the theme, I must tell you something about the sexual curiosity of children. It is most characteristic for child sexuality and significant for the study of neurotic symptoms. The sexual curiosity of children begins very early, sometimes before the third year. It is not connected with the differences of sexes, which means nothing to the child, since the boy, at any rate, ascribes the same male genital to both sexes. When the boy first discovers the primary sexual structure of the female, he tries at first to deny the evidence of his senses, for he cannot conceive a human being who lacks the part of his body that is of such importance to him. Later he is terrified at the possibility revealed to him and he feels the influence of all the former threats, occasioned by his intensive preoccupation with his little organ. He becomes subject to the domination of the castration complex, the formation of which plays an important part in the development of his character, provided he remains healthy; of his neurosis, if he becomes diseased; of his resistance, if he is treated analytically. We know that the little girl feels injured on account of her lack of a large, visible penis, envies the boy his possession, and primarily from this motive desires to be a man. This wish manifests itself subsequently in neurosis, arising from some failure in her role as a woman. During childhood, the clitoris of the girl is the equivalent of the penis; it is especially excitable, the zone where auto-erotic satisfaction is achieved. In the transition to womanhood it is most important that the sensations of the clitoris are completely transferred at the right time to the entrance of the vagina. In cases of so-

called sexual anesthesia of women the clitoris has obstinately retained its excitability.

The sexual interest of children generally turns first to the mystery of birth — the same problem that is the basis of the questions asked by the sphinx of Thebes. This curiosity is for the most part aroused by the selfish fear of the arrival of a new child. The answer which the nursery has ready for the child, that the stork brings children, is doubted far more frequently than we imagine, even by very young children. The feeling that he has been cheated out of the truth by grown-ups, contributes greatly to the child's sense of solitude and to his independent development. But the child is not capable of solving this problem unaided. His undeveloped sexual constitution restricts his ability to understand. At first he assumes that children are produced by a special substance in one's food and does not know that only women can bear children. Later he learns of this limitation and relinquishes the derivation of children from food — a supposition retained in the fairy-tale. The growing child soon notices that the father plays some part in reproduction, but what it is he cannot guess. If, by chance, he is witness of a sexual act, he sees in it an attempt to subjugate, a scuffle, the sadistic miscomprehension of coitus; he does not however relate this act immediately to the evolution of the child. When he discovers traces of blood on the bedsheets or on the clothing of his mother, he considers them the proof of an injury inflicted by the father. During the latter part of childhood, he imagines that the sexual organ of the man plays an important part in the evolution of children, but can ascribe only the function of urination to that part of his body.

From the very outset children unite in believing that the birth of the child takes place through the anus; that the child therefore appears as a ball of faeces. After anal interests have been proven valueless, he abandons this theory and assumes that the navel opens or that the region between the two breasts is the birthplace of the child. In this way the curious child approaches the knowledge of sexual facts, which, clouded by his ignorance, he often fails to see. In the years prior to puberty he generally receives an incomplete, disparaging explanation which often causes traumatic consequences.

You have probably heard that the conception "sexual" is unduly expanded by psychoanalysis in order that it may maintain the hypothesis that all neuroses are due to sexual causes and that the meaning of the

symptoms is sexual. You are now in a position to judge whether or not this expansion is unjustifiable. We have expanded the conception sexual only to include the sexual life of children and of perverse persons. That is to say, we have reëstablished its proper boundaries. Outside of psychoanalysis sexuality means only a very limited thing: normal sexual life in the service of reproduction.

TWENTY-FIRST LECTURE. GENERAL THEORY OF THE NEUROSES

Development of the Libido and Sexual Organizations

I AM under the impression that I did not succeed in convincing you of the significance of perversions for our conception of sexuality. I should therefore like to clarify and add as much as I can.

It was not only perversions that necessitated an alteration of our conception of sexuality, which aroused such vehement contradiction. The study of infantile sexuality did a great deal more along that line, and its close correspondence to the perversions became decisive for us. But the origin of the expressions of infantile sexuality, unmistakable as they are in later years of childhood, seem to be lost in obscurity. Those who disregard the history of evolution and analytic coherence, will dispute the potency of the sexual factor and will infer the agency of generalized forces. Do not forget that as yet we have no generally acknowledged criterion for identifying the sexual nature of an occurrence, unless we assume that we can find it in a relation to the functions of reproduction, and this we must reject as too narrow. The biological criteria, such as the periodicities of twenty-three and twenty-eight days, suggested by W. Fliess, are by no means established; the specific chemical nature which we can possibly assume for sexual occurrences is still to be discovered. The sexual perversions of adults, on the other hand, are tangible and unambiguous. As their generally accepted nomenclature shows, they are undoubtedly sexual in character; whether we designate them as signs of degeneration, or otherwise, no one has yet had the courage to place them outside the phenomena of sex. They alone justify the assertion that sexuality and reproduction are not coincident, for it is clear that all of them disavow the goal of reproduction.

This brings me to an interesting parallel. While “conscious” and “psychic” were generally considered to be identical, we had to make an essay to widen our conception of the “psychic” to recognize as psychic something that was not conscious. Analogously, when “sexual” and “related to reproduction” (or, in shorter form, “genital”) has been generally considered identical, psychoanalysis must admit as “sexual” such things as are not “genital,” things which have nothing to do with

reproduction. It is only a formal analogy, but it does not lack a deeper basis.

But if the existence of sexual perversions is such a compelling argument, why has it not long ago had its effect, and settled the question? I really am unable to say. It appears to be because the sexual perversions are subject to a peculiar ban that extends even into theory, and stands in the way of their scientific appreciation. It seems as if no one could forget that they are not only revolting, but even unnatural, dangerous; as if they had a seductive influence and that at bottom one had to stifle a secret envy of those who enjoyed them. As the count who passes judgment in the famous Tannhauser parody admits:

"And in the mount of Venus, his honor slipped his mind,
It's odd that never happens to people of our kind."

Truthfully speaking, the perverts are rather poor devils who atone most bitterly for the satisfaction they attain with such difficulty.

What makes the perverse activity unmistakably sexual, despite all the strangeness of its object, is that the act in perverse satisfaction most frequently is accompanied by a complete orgasm, and by an ejaculation of the genital product. Of course, this is only true in the case of adults; with children orgasms and genital excretions are hardly possible; they are replaced by rudiments which, again, are not recognized as truly sexual.

In order to complete the appreciation of sexual perversions, I have something to add. Condemned as they are, sharply as they are contrasted with the normal sexual activity, simple observation shows that rarely is normal sex-life entirely free from one or another of the perverse traits. Even the kiss can be claimed to be perverse, for it consists in the union of two erogenous mouth zones in place of the respective genitals. But no one outlaws it as perverse, it is, on the contrary, admitted in theatrical performances as a modified suggestion of the sexual act. This very kissing may easily become a complete perversion if it results in such intensity that it is immediately followed by an emission and orgasm — a thing that is not at all unusual. Further, we can learn that handling and gazing upon the object becomes an essential prerequisite to sexual pleasure; that some, in the height of sexual excitation, pinch and bite, that the greatest excitation is not always called forth in lovers by the genitals, but rather by other

parts of the body, and so forth. There is no sense in considering persons with single traits of this kind abnormal, and counting them among the perverts. Rather, we recognize more and more clearly that the essential nature of perversion does not consist in overstepping the sexual aim, nor in a substitution for the genitals, not even in the variety of objects, but simply in the exclusiveness with which these deviations are carried out and by means of which the sexual act that serves reproduction is pushed aside. When the perverse activities serve to prepare or heighten the normal sexual act, they are really no longer perversions. To be sure, the chasm between normal and perverse sexuality is practically bridged by such facts. The natural result is that normal sexuality takes its origin from something existing prior to it, since certain components of this material are thrown out and others are combined in order to make them subject to a new aim — that of reproduction.

Before we make use of our knowledge of perversions to concentrate anew and with clearer perspective on the study of infantile sexuality, I must call your attention to an important difference between the two. Perverse sexuality is as a rule extraordinarily centralized, its whole action is directed toward one, usually an isolated, goal. A partial instinct has the upper hand. It is either the only one that can be demonstrated or it has subjected the others to its purposes. In this respect there is no difference between normal and perverse sexuality other than that the ruling partial instincts, and with them the sexual goals, are different. In the one case as well as in the other there is, so to say, a well organized tyranny, excepting that here one family and there another has appropriated all the power to itself. Infantile sexuality, on the other hand, is on the whole devoid of such centralization and organization, its individual component impulses are of equal power, and each independently goes in search of the acquisition of pleasurable excitement. The lack as well as the presence of centralization fit in well with the fact that both the perverse and the normal sexuality originated from the infantile. There are also cases of perverse sexuality that have much more similarity with the infantile, where, independently of one another, numerous partial instincts have forced their way, insisted on their aims, or rather perpetuated them. In these cases it is more correct to speak of infantilism of sexual life than of perversions.

Thus prepared we can consider a question which we certainly shall not be spared. People will say to us: “Why are you so set on including within

sexuality those manifestations of childhood, out of which the sexual later develops, but which, according to your own admission, are of uncertain origin? Why are you not satisfied rather with the physiological description, and simply say that even in the suckling one may notice activities, such as sucking objects or holding back excrements, which show us that he strives towards an *organic pleasure*? In that way you would have avoided the estranging conception of sexual life in the tiniest child." I have nothing to say against organic pleasure; I know that the most extreme excitement of the sexual union is only an organic pleasure derived from the activity of the genitals. But can you tell me when this organic pleasure, originally not differentiated, acquires the sexual character that it undoubtedly does possess in the later phases of development? Do you know more about the "organic pleasure" than about sexuality? You will answer, the sexual character is acquired when the genitals begin to play their role; sexual means genital. You will even reject the contrary evidence of the perversions by confronting me with the statement that in most perversions it is a matter of achieving the genital orgasm, although by other means than a union of the genitals. You would really command a much better position if you did not regard as characteristic of the sexual that untenable relation to reproduction seen in the perversions, if you replaced it by activity of the genitals. Then we no longer differ very widely; the genital organs merely replace other organs. What do you make of the numerous practices which show you that the genitals may be represented by other organs in the attainment of gratification, as is the case in the normal kiss, or the perverse practices of "fast life," or the symptoms of hysteria? In these neuroses it is quite usual for stimulations, sensations and innervations, even the process of erection, which is localized in the genitals, to be transferred to other distant parts of the body, so that you have nothing to which you can hold as characteristics of the sexual. You will have to decide to follow my example and expand the designation "sexual" to include the strivings of early childhood toward organic pleasure.

Now, for my justification, I should like you to give me the time for two more considerations. As you know, we call the doubtful and indefinable pleasure activities of earliest childhood sexual because our analysis of the symptoms leads us to them by way of material that is undeniably sexual. We admit that it need not for that reason in itself be sexual. But take an

analogous case. Suppose there were no way to observe the development of two dicotyledonous plants from their seeds — the apple tree and the bean. In both cases, however, imagine it possible to follow their evolution from the fully developed plant backwards to the first seedling with two leaf-divisions. The two little leaves are indistinguishable, in both cases they look exactly alike. Shall I conclude from this that they really are the same and that the specific differences between an apple tree and bean plant do not appear until later in the history of the plant? Or is it biologically more correct to believe that this difference is already present in the seedling, although the two little leaves show no differences? We do the same thing when we term as sexual the pleasure derived from the activities of the suckling. Whether each and every organic enjoyment may be called sexual, or if besides the sexual there is another that does not deserve this name, is a matter I cannot discuss here. I know too little about organic pleasure and its conditions, and will not be at all surprised if the retrogressive character of the analysis leads us back finally to a generalized factor.

One thing more. You have on the whole gained very little for what you are so anxious to maintain, the sexual purity of the child, even when you can convince me that the activities of the suckling had better not be called sexual. For from the third year on, there is no longer any doubt concerning the presence of a sexual life in the child. At this time the genitals already begin to become active; there is perhaps regularly a period of infantile masturbation, in other words, a gratification by means of the genitals. The psychic and social expressions of the sexual life are no longer absent; choice of an object, affectionate preference for certain persons, indeed, a leaning toward one of the two sexes, jealousy — all these have been established independently by unprejudiced observation, prior to the advent of psychoanalysis, and confirmed by every careful observer. You will say that you had no doubt as to the early awakening of affection, you will take issue only with its sexual nature. Children between the ages of three and eight have already learned to hide these things, but if you look sharply you can always gather sufficient evidence of the “sexual” purpose of this affection. What escapes you will be amply supplied by investigation. The sexual goals of this period of life are most intimately connected with the contemporaneous sexual theories, of which I have given you some examples. The perverse nature of some of these goals is the result of the

constitutional immaturity of the child, who has not yet discovered the goal of the act of copulation.

From about the sixth or the eighth year on a pause in, and reversion of, sexual development is noticeable, which in the cases that reach the highest cultural standard deserves the name of a latent period. The latent period may also fail to appear and there need not be an interruption of sexual activity and sexual interests at any period. Most of the experiences and impulses prior to the latent period then fall victim to the infantile amnesia, the forgetting we have already discussed, which cloaks our earliest childhood and makes us strangers to it. In every psychoanalysis we are confronted with the task of leading this forgotten period of life back into memory; one cannot resist the supposition that the beginning of sexual life it contains furnishes the motive for this forgetting, namely, that this forgetting is a result of suppression.

The sexual life of the child shows from the third year that it has much in common with that of the adult; it is distinguished from the latter, as we already know, by the lack of stable organization under the primacy of the genitals, by the unavoidable traits of perversion, and, naturally, by the far lesser intensity of the whole impulse. Theoretically the most interesting phases of the sexual development or, as we would rather say, the libido-development, so far as theory is concerned, lie back of this period. This development is so rapidly gone through that perhaps it would never have been possible for direct observation to grasp its fleeting pictures. Psychoanalytic investigation of the neuroses has for the first time made it possible to discover more remote phases of the libido-development. These are, to be sure, nothing but constructions, but if you wish to carry on psychoanalysis in a practical way you will find that they are necessary and valuable constructions. You will soon understand why pathology may disclose conditions which we would have overlooked in the normal object.

We can now declare what form the sexual life of the child takes before the primacy of the genitals is established. This primacy is prepared in the first infantile epoch prior to the latent period, and is continuously organized from puberty on. There is in this early period a sort of loose organization, which we shall call *pre-genital*. In the foreground of this phase, however, the partial instincts of the genitals are not prominent, rather the *sadistic* and *anal*. The contrast between *masculine* and *feminine* plays no part as yet, its place is taken by the contrast between *active* and

passive, which we may designate as the forerunner of sexual polarity, with which it is later fused. That which appears masculine to us in the activity of this phase, observed from the standpoint of the later genital stage, is the expression of an instinct to mastery, which may border on cruelty. Impulses with passive goals attach themselves to the erogenous zone of the rectal opening. Most important at this time, curiosity and the instinct to watch are powerful. The genital really takes part in the sexual life only in its role as excretory organ for the bladder. Objects are not lacking to the partial impulses of this period, but they do not necessarily combine into a single object. The sadistico-anal organization is the step antecedent to the phase of genital primacy. A more penetrating study furnishes proof how much of this is retained for the later and final form, and in what ways its partial instincts are forced into line under the new genital organization. Back of the sadistico-anal phase of libido-development, we get a view of an earlier, even more primitive phase of organization, in which the erogenous mouth-zone plays the chief role. You may surmise that the sexual activity of sucking belongs to it, and may wonder at the intuition of the ancient Egyptians, whose art characterized the child, as well as the god Horus, with the finger in his month. Abraham only recently published material concerning the traces which this primitive oral phase has left upon the sexual life of later years.

I can surmise that these details about sexual organization have burdened your mind more than they have informed you. Perhaps I have again gone into detail too much. But be patient; what you have heard will become more valuable through the uses to which it is later put. Keep well in mind the impression that sexual life, as we call it, the function, of the libido, does not make its appearance as a completed whole, nor does it develop in its own image, but goes through a series of successive phases which are not similar to each other. In fact, it is a developmental sequence, like that from the grub to the butterfly. The turning point of the development is the subordination of all sexual partial-instincts to the primacy of the genitals, and thereby the subjection of sexuality to the function of reproduction. Originally it is a diffused sexual life, one which consists of independent activities of single partial instincts which strive towards organic gratification. This anarchy is modified by approaches to pre-genital organization, first of all the sadistico-anal phase, prior to this the oral phase, which is perhaps the most primitive. Added to this there are

the various processes, as yet not well known, which carry over one organization level to the later and more advanced phase. The significance, for the understanding of the neuroses, of the long evolutionary path of the libido which carries it over so many grades we shall discuss on another occasion.

Today we shall look at another angle of the development, namely the relation of the partial instinct to the object. We shall make a hurried survey of this development in order to spend more time upon a relatively later product. Some of the components of the sex instincts have had an object from the very beginning and hold fast to it; such are the instinct to mastery (sadism), curiosity, and the impulse to watch. Other impulses which are more clearly attached to specific erogenous zones of the body have this object only in the beginning, as long as they adhere to the functions which are not sexual; they release this object when they free themselves from these non-sexual functions. The first object of the oral component of the sexual impulse is the mother's breast, which satisfies the hunger of the infant. By the act of sucking, the erotic component which is also satisfied by the sucking becoming independent, it gives up the foreign object and replaces it by some part of its own body. The oral impulse becomes *auto-erotic*, just as the anal and other erogenous impulses are from the very beginning. Further development, to express it most briefly, has two goals — first, to give up auto-eroticism, and, again, to substitute for the object of one's own body a foreign object; second, to unify the different objects into a single impulse, replace them by a single object. To be sure, that can happen only if this single object is itself complete, a body similar to one's own. Nor can it be consummated without leaving behind as useless a large number of the auto-erotic instinctive impulses.

The processes of finding the object are rather involved, and have as yet had no comprehensive exposition. For our purpose, let us emphasize the fact that when the process has come to a temporary cessation in the childhood years, before the latent period, the object it has found is seen to be practically identical with the first object derived from its relation to the object of the oral pleasure impulse. It is, if not the mother's breast, the mother herself. We call the mother the first *object of love*. For we speak of love when we emphasize the psychic side of sex-impulses, and disregard or for a moment wish to forget the fundamental physical or "sensual" demands of the instincts. At the time when the mother becomes the object

of love, the psychic work of suppression which withdraws the knowledge of a part of his sexual goal from his consciousness has already begun in the child. The selection of the mother as the object of love involves everything we understand by the Oedipus complex which has come to have such great significance in the psychoanalytic explanation of neuroses, and which has had no small part in arousing opposition to psychoanalysis.

Here is a little experience which took place during the present war: A brave young disciple of psychoanalysis is a doctor at the German front somewhere in Poland, and attracts the attention of his colleagues by the fact that he occasionally exercises an unexpected influence in the case of a patient. Upon being questioned he admits that he works by means of psychoanalysis and is finally induced to impart his knowledge to his colleagues. Every evening the physicians of the corps, colleagues and superiors, gather in order to listen to the inmost secrets of analysis. For a while this goes on nicely, but after he has told his audience of the Oedipus-complex, a superior rises and says he does not believe it, that it is shameful for the lecturer to tell such things to them, brave men who are fighting for their fatherland, and who are the fathers of families, and he forbade the continuation of the lectures. This was the end.

Now you will be impatient to discover what this frightful Oedipus-complex consists of. The name tells you. You all know the Greek myth of King Oedipus, who is destined by the fates to kill his father, and take his mother to wife, who does everything to escape the oracle and then does penance by blinding himself when he discovers that he has, unknowingly, committed these two sins. I trust many of you have yourselves experienced the profound effect of the tragedy in which Sophocles handles this material. The work of the Attic poet presents the manner in which the deed of Oedipus, long since accomplished, is finally brought to light by an artistically prolonged investigation, continuously fed with new evidence; thus far it has a certain similarity to the process of psychoanalysis. In the course of the dialogue it happens that the infatuated mother-wife, Jocasta, opposes the continuation of the investigation. She recalls that many men have dreamed that they have cohabited with their mothers, but one should lay little stress on dreams. We do not lay little stress on dreams, least of all typical dreams such as occur to many men, and we do not doubt that this dream mentioned by Jocasta is intimately connected with the strange and frightful content of the myth.

It is surprising that Sophocles' tragedy does not call forth much greater indignation and opposition on the part of the audience, a reaction similar to, and far more justified, than the reaction to our simple military physician. For it is a fundamentally immoral play, it dispenses with the moral responsibility of men, it portrays godlike powers as instigators of guilt, and shows the helplessness of the moral impulses of men which contend against sin. One might easily suppose that the burden of the myth purposed accusation against the gods and Fate, and in the hands of the critical Euripides, always at odds with the gods, it would probably have become such an accusation. But there is no trace of this in the work of the believer Sophocles. A pious sophistry which asserts that the highest morality is to bow to the will of the gods, even if they command a crime, helps him over the difficulty. I do not think that this moral constitutes the power of the drama, but so far as the effect goes, that is unimportant; the listener does not react to it, but to the secret meaning and content of the myth. He reacts as though through self-analysis he had recognized in himself the Oedipus-complex, and had unmasked the will of the gods, as well as the oracle, as sublime disguises of his own unconsciousness. It is as though he remembered the wish to remove his father, and in his place to take his mother to wife, and must be horrified at his own desires. He also understands the voice of the poet as if it were telling him: "You revolt in vain against your responsibility, and proclaim in vain the efforts you have made to resist these criminal purposes. In spite of these efforts, you are guilty, for you have not been able to destroy the criminal purposes, they will persist unconsciously in you." And in that there is psychological truth. Even if man has relegated his evil impulses to the unconscious, and would tell himself that he is no longer answerable for them, he will still be compelled to experience this responsibility as a feeling of guilt which he cannot trace to its source.

It is not to be doubted for a moment that one may recognize in the Oedipus-complex one of the most important sources for the consciousness of guilt with which neurotics are so often harassed. But furthermore, in a study of the origins of religion and morality of mankind which I published in 1913, under the title of *Totem and Taboo,* the idea was brought home to me that perhaps mankind as a whole has, at the beginning of its history, come by its consciousness of guilt, the final source of religion and morality, through the Oedipus-complex. I should like to say more on this

subject, but perhaps I had better not. It is difficult to turn away from this subject now that I have begun speaking of it, but we must return to individual psychology.

What does direct observation of the child at the time of the selection of its object, before the latent period, show us concerning the Oedipus-complex? One may easily see that the little man would like to have the mother all to himself, that he finds the presence of his father disturbing, he becomes irritated when the latter permits himself to show tenderness towards the mother, and expresses his satisfaction when the father is away or on a journey. Frequently he expresses his feelings directly in words, promises the mother he will marry her. One may think this is very little in comparison with the deeds of Oedipus, but it is actually enough, for it is essentially the same thing. The observation is frequently clouded by the circumstance that the same child at the same time, on other occasions, gives evidence of great tenderness towards its father; it is only that such contradictory, or rather, *ambivalent* emotional attitudes as would lead to a conflict in the case of an adult readily take their place side by side in a child, just as later on they permanently exist in the unconscious. You might wish to interpose that the behavior of the child springs from egoistic motives and does not justify the setting up of an erotic complex. The mother provides for all the necessities of the child, and it is therefore to the child's advantage that she troubles herself for no one else. This, too, is correct, but it will soon be clear that in this, as in similar situations, the egoistic interest offers only the opportunity upon which the erotic impulse seizes. If the little one shows the most undisguised sexual curiosity about his mother, if he wants to sleep with her at night, insists upon being present while she is dressing, or attempts to caress her, as the mother can so often ascertain and laughingly relates, it is undoubtedly due to the erotic nature of the attachment to his mother. We must not forget that the mother shows the same care for her little daughter without achieving the same effect, and that the father often vies with her in caring for the boy without being able to win the same importance in his eyes as the mother. In short, it is clear that the factor of sex-preference cannot be eliminated from the situation by any kind of criticism. From the standpoint of egoistic interest it would merely be stupid of the little fellow not to tolerate two persons in his services rather than only one.

I have, as you will have noticed, described only the relation of the boy to his father and mother. As far as the little girl is concerned, the process is the same with the necessary modifications. The affectionate devotion to the father, the desire to set aside the mother as superfluous and to take her place, a coquetry which already works with all the arts of later womanhood, give such a charming picture, especially in the baby girl, that we are apt to forget its seriousness, and the grave consequences which may result from this infantile situation. Let us not fail to add that frequently the parents themselves exert a decisive influence over the child in the wakening of the Oedipus attitude, in that they themselves follow a sex preference when there are a number of children. The father in the most unmistakable manner shows preference for the daughter, while the mother is most affectionate toward the son. But even this factor cannot seriously undermine the spontaneous character of the childish Oedipus-complex. The Oedipus-complex expands and becomes a family-complex when other children appear. It becomes the motive force, revived by the sense of personal injury, which causes the child to receive its brothers and sisters with aversion and to wish to remove them without more ado. It is much more frequent for the children to express these feelings of hatred than those arising from the parent-complex. If such a wish is fulfilled, and death takes away the undesired increase in the family, after a short while we may discover through analysis what an important experience this death was for the child, even though he had not remembered it. The child forced into second place by the birth of a little brother or sister, and for the first time practically isolated from his mother, is loathe to forgive her for this; feelings which we would call extreme bitterness in an adult are aroused in him and often become the basis of a lasting estrangement. We have already mentioned that sexual curiosity with all its consequences usually grows out of these experiences of the child. With the growing up of these brothers and sisters the relation to them undergoes the most significant changes. The boy may take his sister as the object for his love, to replace his faithless mother; situations of dangerous rivalry, which are of vast importance for later life, arise even in the nursery among numerous brothers who court the affection of a younger sister. A little girl finds in her older brother a substitute for her father, who no longer acts towards her with the same affection as in former years, or she takes a younger sister as a substitute for the child that she vainly wished of her father.

Such things, and many more of a similar character, are shown by the direct observation of children and the consideration of their vivid childish recollections, which are not influenced by the analysis. You will conclude, among other things, that the position of a child in the sequence of his brothers and sisters is of utmost importance for the entire course of his later life, a factor which should be considered in every biography. In the face of these explanations that are found with so little effort, you will hardly recall without smiling the scientific explanations for the prohibition of incest. What inventions! By living together from early childhood the sexual attraction must have been diverted from these members of the family who are of opposite sex, or a biological tendency against in-breeding finds its psychic equivalent in an innate dread of incest! In this no account is taken of the fact that there would be no need of so unrelenting a prohibition by law and morality if there were any natural reliable guards against the temptation of incest. Just the opposite is true. The first choice of an object among human beings is regularly an incestuous one, in the man directed toward the mother and sister, and the most stringent laws are necessary to prevent this persisting infantile tendency from becoming active. Among the primitive races the prohibitions against incest are much more stringent than ours, and recently Th. Reik showed in a brilliant paper that the puberty-rites of the savages, which represent a rebirth, have the significance of loosing the incestuous bonds of the boy to his mother, and of establishing the reconciliation with the father.

Mythology teaches that incest, apparently so abhorred by men, is permitted to the gods without further thought, and you may learn from ancient history that incestuous marriage with his sister was holy prescript for the person of the ruler (among the ancient Pharaohs and the Incas of Peru). We have here a privilege denied the common herd.

Incest with his mother is one of the sins of Oedipus, patricide the other. It might also be mentioned that these are the two great sins which the first social-religious institution of mankind, totemism, abhors. Let us turn from the direct observation of the child to analytic investigation of the adult neurotic. What does analysis yield to the further knowledge of the Oedipus-complex? This is easily told. It shows the patient up in the light of the myth; it shows that each of these neurotics was himself an Oedipus or, what amounts to the same thing, became a Hamlet in the reaction to the

complex. To be sure, the analytic representation of the Oedipus-complex enlarges upon and is a coarser edition of the infantile sketch. The hatred of the father, the death-wish with regard to him, are no longer timidly suggested, the affection for the mother recognizes the goal of possessing her for a wife. Dare we really accredit these horrible and extreme feelings to those tender childhood years, or does analysis deceive us by bringing in some new element? It is not difficult to discover this. Whenever an account of past events is given, be it written even by a historian, we must take into account the fact that inadvertently something has been interpolated from the present and from intervening times into the past; so that the entire picture is falsified. In the case of the neurotic it is questionable whether this interpolation is entirely unintentional or not; we shall later come to learn its motives and must justify the fact of "imagining back" into the remote past. We also easily discover that hatred of the father is fortified by numerous motives which originate in later times and circumstances, since the sexual wishes for the mother are cast in forms which are necessarily foreign to the child. But it would be a vain endeavor to explain the whole of the Oedipus-complex by "imagining back," and as related to later times. The infantile nucleus and more or less of what has been added to it continues to exist and may be verified by the direct observation of the child.

The clinical fact which we meet with in penetrating the form of the Oedipus-complex as established by analysis, is of the greatest practical importance. We learn that at the period of puberty, when the sexual instinct first asserts its demands in full strength, the old incestuous and familiar objects are again taken up and seized anew by the libido. The infant's choice of an object was feeble, but it nevertheless set the direction for the choice of an object in puberty. At that time very intense emotional experiences are brought into play and directed towards the Oedipus-complex, or utilized in the reaction to it. However, since their presuppositions have become unsupportable, they must in large part remain outside of consciousness. From this time on the human individual must devote himself to the great task of freeing himself from his parents, and only after he has freed himself can he cease to be a child, and become a member of the social community. The task confronting the son consists of freeing himself from his libidinous wishes towards his mother and utilizing them in the quest for a really foreign object for his love. He must

also effect a reconciliation with his father, if he has stayed hostile to him, or if in the reaction to his infantile opposition he has become subject to his domination, he must now free himself from this pressure. These tasks are set for every man; it is noteworthy how seldom their solution is ideally achieved, i.e., how seldom the solution is psychologically as well as socially correct. Neurotics, however, find no solution whatever; the son remains during his whole life subject to the authority of his father, and is not able to transfer his libido to a foreign sexual object. Barring the difference in the specific relation, the same fate may befall the daughter. In this sense the Oedipus-complex is correctly designated as the nucleus of the neurosis.

You can imagine how rapidly I am reviewing a great number of conditions which are associated with the Oedipus-complex, of practical as well as of theoretical importance. I cannot enter upon their variations or possible inversions. Of its less immediate relations I only wish to indicate the influence which the Oedipus-complex has been found to exert on literary production. In a valuable book, Otto Rank has shown that the dramatists of all times have taken their materials principally from the Oedipus-and incest-complexes, with their variations and disguises. Moreover, we will not forget to mention that the two guilty wishes of Oedipus were recognized long before the time of psychoanalysis as the true representatives of the unrestrained life of impulses. Among the writings of the encyclopedist Diderot we find a famous dialogue, *The Nephew of Ramau*, which no less a person than Goethe has translated into German. In this you may read the remarkable sentence: "*If the little savage were left to himself he would preserve all his imbecility, he would unite the passions of a man of thirty to the unreasonableness of the child in the cradle; he would twist his father's neck and bed with his mother*."

There is also one other thing of which I must needs speak. The mother-wife of Oedipus shall not have reminded us of the dream in vain. Do you still remember the result of our dream analysis, that the wishes out of which the dream is constructed so frequently are of a perverse, incestuous nature, or disclose an enmity toward near and beloved relatives the existence of which had never been suspected? At the time we did not trace the sources of these evil impulses. Now you may see them for yourselves. They represent the disposition made in early infancy of the libidinous energy, with the objects, long since given up in conscious life, to which it

had once clung, which are now shown at night to be still present and in a certain sense capable of activity. But since all people have such perverse, incestuous and murderous dreams, and not the neurotics alone, we may conclude that even those who are normal have passed through the same evolutionary development, through the perversions and the direction of the libidio toward the objects of the Oedipus-complex. This, then, is the way of normal development, upon which the neurotics merely enlarge. They show in cruder form what dream analysis exposes in the healthy dreamer as well. Accordingly here is one of the motives which led us to deal with the study of the dream before we considered the neurotic symptom.

TWENTY-SECOND LECTURE. GENERAL THEORY OF THE NEUROSES

Theories of Development and Regression — Etiology

WE have learned that the libidio goes through an extensive development before it can enter the service of reproduction in a way which may be regarded as normal. Now I wish to present to you what importance this fact possesses for the causation of neuroses.

I believe we are in harmony with the teachings of general pathology in assuming that this development involves two dangers, inhibition and regression. In other words, with the universal tendency of biological processes toward variation, it must necessarily happen that not all preparatory phases of a given function are equally well passed through or accomplished with comparable thoroughness. Certain components of a function may be permanently held back in an early stage of development and the complete development is therefore retarded to a certain extent.

Let us seek analogies for these processes from other fields. If a whole people leaves its dwellings to seek a new home, as frequently happened in the early periods of the history of mankind, their entire number will certainly not reach the new destination. Setting aside other losses, small groups or associations of these wandering peoples would stop on the way, and, while the majority passes on, they would settle down at these way-stations. Or, to seek a more appropriate comparison: You know that in the most highly evolved mammals, the male seminal glands, which originally are located in the far depths of the abdominal cavity, begin to wander during a certain period of intra-uterine life until they reach a position almost immediately under the skin of the pelvic extremity. In the case of a number of male individuals, one of the paired glands may as a result of this wandering remain in the pelvic cavity, or may be permanently located in the canal through which both glands must pass in their journey, or finally the canal itself may stay open permanently instead of growing together with the seminal glands after the change of position has taken place normally. When, as a young student, I was doing my first piece of scientific research under the direction of von Brücke, I was working on the dorsal nerve-roots in the spinal cord of a small fish very archaic in form. I discovered that the nerve ganglia of these roots grow out from large cells

which lie in the grey matter of the dorsal column, a condition no longer true of other vertebrates. But I soon discovered that such nerve cells are found outside the grey matter all the way to the so-called spinal ganglion of the dorsal root. From this I concluded that the cells of this group of ganglia had traveled from the spinal cord to the roots of the nerves. This same result is attested by embryology. In this little fish, however, the entire path of the journey was traceable by the cells that had remained behind. Closer observation will easily reveal to you the weak points of these comparisons. Therefore let me simply say that with reference to every single sexual impulse, I consider it possible for several of its components to be held back in the earlier stages of development while other components have worked themselves out to completion. You will realize that we think of every such impulse as a current continuously driving on from the very beginning of life, and that our resolving it into individual movements which follow separately one upon the other is to a certain extent artificial. Your impression that these concepts require further clarification is correct, but an attempt would lead to too great digression. Before we pass on, however, let us agree to call this arrest of a partial impulse in an early stage of development, a *fixation* of the instinct.

Regression is the second danger of this development by stages. Even those components which have achieved a degree of progress may readily turn backward to these earlier stages. Having attained to this later and more highly developed form, the impulse is forced to a regression when it encounters great external difficulties in the exercise of its function, and accordingly cannot reach the goal which will satisfy its strivings. We can obviously assume that fixation and regression are not independent of each other. The stronger the fixations in the process of development prove to be, the more readily will the function evade external difficulties by a regression back to those fixations, and the less capable will the fully developed function be to withstand the hindrances that stand in the way of its exercise. Remember that if a people in its wandering has left large groups at certain way-stations, it is natural for those who have gone on to return to these stations if they are beaten or encounter a mighty foe. The more they have left on the way, however, the greater is their chance of defeat.

For your comprehension of the neuroses it is necessary to keep in mind this connection between fixation and regression. This will give you a

secure hold upon the question of the cause of neuroses — of the etiology of neuroses — which we shall soon consider.

For the present we have still to discuss various aspects of regression. With the knowledge you have gained concerning the development of the function of libido, you must expect two kinds of regression: incestuous return to the first libidinous objects and return of the entire sexual organization to an earlier stage of development. Both occur in the transference neuroses and play an important part in its mechanism. Especially is the return to the first incestuous objects of libido a feature that the neurotic exhibits with positively tiresome regularity. We could say far more about regression of libido if we took into consideration another group of neuroses: neurotic narcism. But we cannot do this now. These conditions give us a clue to other stages of development of the function of libido, which have not been mentioned previously, and correspondingly show new kinds of regression. But I think the most important task before me at this point is to warn you not to confuse *regression* and *suppression*, and aid you to see clearly the connection between the two processes. Suppression, as you know, is the process by which an act capable of becoming conscious, in other words, an act that belongs to the fore-conscious system, is rendered unconscious and accordingly is thrust back into the unconscious system. Similarly we speak of suppression when the unconscious psychic act never has been admitted into the adjoining fore-conscious system but is arrested by the censor at the threshold. Kindly observe that the conception of suppression has nothing to do with sexuality. It describes a purely psychological process, which could better be characterized by terming it *localized*. By that we mean that it is concerned with the spatial relationships within the psyche, or if we drop this crude metaphor, with building up the psychological apparatus out of separate, psychic systems.

Through these comparisons we observe that up to this point we have not used the word regression in its general, but in a very special sense. If you accord it the general meaning of return from a higher to a lower stage of development you must include suppression as a form of regression, for suppression may also be described as the reversion to an earlier and lower stage in the development of a psychic act. Only in regard to suppression, this tendency to revert is not necessarily involved, for when a psychic act is held back in the early unconscious stage we also term it suppression in a

dynamic sense. Suppression is a localized and dynamic conception, regression purely descriptive. What up this point we have called regression and considered in its relation to fixation, was only the return of libido to former stages of its development. The nature of this latter conception is entirely distinct and independent of suppression. We cannot call the libido regressions purely psychical processes and do not know what localization in the psychological apparatus we should assign to them. Even though the libido exerts a most powerful influence on psychic life, its organic significance is still the most conspicuous.

Discussions of this sort, gentlemen, are bound to be somewhat dry. To render them more vivid and impressive, let us return to clinical illustrations. You know that hysteria and compulsion-neurosis are the two chief factors in the group of transference neuroses. In hysteria, libidinous return to primary, incestuous sexual objects is quite regular, but regression to a former stage of sexual organization very rare. In the mechanism of hysteria suppression plays the chief part. If you will permit me to supplement our previous positive knowledge of this neurosis by a constructive suggestion, I could describe the state of affairs in this manner: the union of the partial instincts under the domination of the genitals is accomplished, but its results encounter the opposition of the fore-conscious system which, of course, is bound up with consciousness. Genital organization, therefore, may stand for the unconscious but not for the fore-conscious. Through this rejection on the part of the fore-conscious, a situation arises which in certain aspects is similar to the condition existing before the genitals had attained their primacy. Of the two libido regressions, the regression to a former stage of sexual organization is by far the more conspicuous. Since it is lacking in hysteria and our entire conception of the neuroses is still too much dominated by the study of hysteria which preceded it in point of time, the meaning of libido regression became clearer to us much later than that of repression. Let us be prepared to widen and change our attitude still more when we consider other narcistic neuroses besides compulsion-neurosis and hysteria in our discussion.

In contrast to this, regression of libido in compulsion-neurosis turns back most conspicuously to the earlier sadistico-anal organization, which accordingly becomes the most significant factor expressed by the symptoms. Under these conditions the love impulse must mask itself as a

sadistic impulse. The compulsion idea must therefore be reinterpreted. Isolated from other superimposed factors, which though they are not accidental are also indispensable, it no longer reads: “I want to murder you”; rather it says “I want to enjoy you in love.” Add to this, that simultaneously regression of the object has also set in, so that this impulse is invariably directed toward the nearest and dearest persons, and you can imagine with what horror the patient thinks of these compulsion ideas and how alien they appear to his conscious perception. In the mechanism of these neuroses, suppression, too, assumes an important part, which it is not easy to explain in a superficial discussion of this sort. Regression of the libido without suppression would never result in neurosis but would finally end in perversion. This makes it obvious that suppression is the process most characteristic of neurosis, and typifies it most perfectly. Perhaps I shall at some future time have the opportunity of presenting to you our knowledge of the mechanism of perversions and then you will see that here also things do not work themselves out as simply as we should best like to construe them.

You will most readily reconcile yourself with these elucidations of fixation and regression, when you consider them as a preface to the investigation of the etiology of neuroses. Towards this I have only advanced a single fact: that people become neurotically ill when the possibility of satisfying their libido is removed, ill with “denial,” as I expressed myself, and that their symptoms are the substitutes for the denied gratification. Of course, that does not mean that every denial of libidinous satisfaction makes every person neurotic, but merely that in all cases known of neurosis, the factor of denial was traceable. The syllogism therefore cannot be reversed. You also understand, I trust, that this statement is not supposed to reveal the entire secret of the etiology of neurosis, but only emphasizes an important and indispensable condition.

Now, we do not know, in the further discussion of this statement, whether to emphasize the nature of denial or the individuality of the person affected by it. Denial is very rarely complete and absolute; to cause a pathological condition, the specific gratification desired by the particular person in question must be withheld, the certain satisfaction of which he alone is capable. On the whole there are many ways of enduring abstinence from libidinous gratification without succumbing to a neurosis by reason thereof. Above all we know of people who are able to endure abstinence

without doing themselves injury; they are not happy under the circumstances, they are filled with yearning, but they do not become ill. Furthermore, we must take into consideration that the impulses of the sex instinct are extraordinarily *plastic*, if I may use that term in this connection. One thing may take the place of the other; one may assume the other's intensity; if reality refuses the one gratification, the satisfaction of another may offer full compensation. The sexual impulses are like a network of communicating channels filled with fluids; they are this in spite of their subjugation to the primacy of the genitals, though I realize it is difficult to unite these two ideas in one conception. The component impulses of sexuality as well as the total sexual desire, which represents their aggregate, show a marked ability to change their object, to exchange it, for instance, for one more easily attainable. This displacement and the readiness to accept substitutes must exert powerful influences in opposition to the pathological effect of abstinence. Among these processes which resist the ill effects of abstinence, one in particular has won cultural significance. Sexual desire relinquishes either its goal of partial gratification of desire, or the goal of desire toward reproduction, and adopts another aim, genetically related to the abandoned one, save that it is no longer sexual but must be termed social. This process is called "sublimation," and in adopting this process we subscribe to the general standard which places social aims above selfish sexual desires. Sublimation is, as a matter of fact, only a special case of the relation of sexual to non-sexual desires. We shall have occasion to talk more about this later in another connection.

Now your impression will be that abstinence has become an insignificant factor, since there are so many methods of enduring it. Yet this is not the case, for its pathological power is unimpaired. The remedies are generally not sufficient. The measure of unsatisfied libido which the average human being can stand is limited. The plasticity and freedom of movement of libido is by no means retained to the same extent by all individuals; sublimation can, moreover, never account for more than a certain small fraction of the libido, and finally most people possess the capacity for sublimation only to a very slight degree. The most important of these limitations clearly lies in the adaptability of the libido, as it renders the gratification of the individual dependent upon the attainment of only a very few aims and objects. Kindly recall that incomplete

development of the libido leaves extensive and possibly even numerous libido fixations in earlier developmental phases of the processes of sexual organization and object-finding, and that these phases are usually not capable of affording a real gratification. You will then recognize libido fixation as the second powerful factor which together with abstinence constitutes the causative factors of the illness. We may abbreviate schematically and say that libido fixation represents the internal disposing factor, abstinence the accidental external factor of the etiology of neurosis.

I seize the opportunity to warn you of taking sides in a most unnecessary conflict. In scientific affairs it is a popular proceeding to emphasize a part of the truth in place of the whole truth and to combat all the rest, which has lost none of its verity, in the name of that fraction. In this way various factions have already separated out from the movement of psychoanalysis; one faction recognizes only the egoistic impulses and denies the sexual, another appreciates the influence of objective tasks in life, but ignores the part played by the individual past, and so on. Here is occasion for a similar antithesis and subject for dispute: are neuroses *exogenous* or *endogenous* diseases, are they the inevitable results of a special constitution or the product of certain harmful (traumatic) impressions; in particular, are they called forth by libido fixation (and the sexual constitution which goes with this) or through the pressure of forbearance? This dilemma seems to me no whit wiser than another I could present to you: is the child created through the generation of the father or the conception of the mother? Both factors are equally essential, you will answer very properly. The conditions which cause neuroses are very similar if not precisely the same. For the consideration of the causes of neuroses, we may arrange neurotic diseases in a series, in which two factors, sexual constitution and experience, or, if you wish, libido-fixation and self-denial, are represented in such a way that one increases as the other decreases. At one end of the series are the extreme cases, of which you can say with full conviction: These persons would have become ill because of the peculiar development of their libido, no matter what they might have experienced, no matter how gently life might have treated them. At the other end are cases which would call forth the reversed judgment, that the patients would undoubtedly have escaped illness if life had not thrust certain conditions upon them. But in the intermediate cases of the series, predisposing sexual constitution and subversive demands of

life combine. Their sexual constitution would not have given rise to neurosis if the victims had not had such experiences, and their experiences would not have acted upon them traumatically if the conditions of the libido had been otherwise. Within this series I may grant a certain preponderance to the weight carried by the predisposing factors, but this admission, too, depends upon the boundaries within which you wish to delimit nervousness.

Allow me to suggest that you call such series *complementary series*. We shall have occasion to establish other series of this sort.

The tenacity with which the libido clings to certain tendencies and objects, the so-called *adhesiveness* of the libido, appears to us as an independent factor, individually variable, the determining conditions of which are completely unknown to us, but the importance of which for the etiology of the neuroses we can no longer underestimate. At the same time we must not overestimate the closeness of this interrelation. A similar adhesiveness of the libido occurs — for unknown reasons — in normal persons under various conditions, and is a determining factor in the perverse, who are in a certain sense the opposite of nervous. Before the period of psychoanalysis, it was known (Binet) that the anamnesia of the perverse is often traced back to an early impression — an abnormality in the tendency of the instinct or its choice of object — and it is to this that the libido of the individual has clung for life. Frequently it is hard to say how such an impression becomes capable of attracting the libido so intensively. I shall give you a case of this kind which I observed myself. A man, to whom the genital and all other sex stimuli of woman now mean nothing, who in fact can only be thrown into an irresistible sexual excitation by the sight of a shoe on a foot of a certain form, is able to recall an experience he had in his sixth year, which proved decisive for the fixation of his libido. One day he sat on a stool beside his governess, who was to give him an English lesson. She was an old, shriveled, unbeautiful girl with washed-out blue eyes and a pug nose, who on this day, because of some injury, had put a velvet slipper on her foot and stretched it out on a footstool; the leg itself she had most decorously covered. After a diffident attempt at normal sexual activity, undertaken during puberty, such a thin sinewy foot as his governess' had become the sole object of his sexuality; and the man was irresistibly carried away if other features, reminiscent of the English governess, appeared in conjunction with the foot. Through this

fixation of the libido the man did not become neurotic but perverse, a foot fetishist, as we say. So you see that, although exaggerated and premature fixation of the libido is indispensable for the causation of neuroses, its sphere of action exceeds the limits of neuroses immeasurably. This condition also, taken by itself, is no more decisive than abstinence.

And so the problem of the cause of neuroses seems to become more complicated. Psychoanalytic investigation does, in fact, acquaint us with a new factor, not considered in our etiological series, which is recognized most easily in those cases where permanent well-being is suddenly disturbed by an attack of neurosis. These individuals regularly show signs of contradiction between their wishes, or, as we are wont to say, indication of psychic *conflict*. A part of their personality represents certain wishes, another rebels against them and resists them. A neurosis cannot come into existence without such conflict. This may seem to be of small significance. You know that our psychic life is continually agitated by conflicts for which we must find a solution. Certain conditions, therefore, must exist to make such a conflict pathological. We want to know what these conditions are, what psychic powers form the background for these pathological conflicts, what relation the conflict bears to the causative factors.

I hope I shall be able to give you satisfactory answers to these questions even if I must make them schematically brief. Self-denial gives rise to conflict, for libido deprived of its gratification is forced to seek other means and ends. A pathogenic conflict arises when these other means and ends arouse the disfavor of one part of the personality, and a veto ensues which makes the new mode of gratification impossible for the time being. This is the point of departure for the development of the symptoms, a process which we shall consider later. The rejected libidinous desires manage to have their own way, through circuitous byways, but not without catering to the objections through the observance of certain symptom-formation; the symptoms are the new or substitute satisfaction which the condition of self-denial has made necessary.

We can express the significance of the psychic conflict in another way, by saying: the *outer* self-denial, in order to become pathological, must be supplemented by an *inner* self-denial. Outer denial removes one possibility of gratification, inner denial would like to exclude another possibility, and it is this second possibility which becomes the center of

the ensuing conflict. I prefer this form of presentation because it possesses secret content. It implies the probability that the inner impediment found its origin in the prehistoric stage of human development in real external hindrances.

What powers are these which interpose objections to libidinous desire, who are the other parties to the pathological conflict? They are, in the widest sense, the non-sexual impulses. We call them comprehensively the "ego impulses"; psychoanalysis of transference neuroses does not grant us ready access to their further investigation, but we learn to know them, in a measure, through the resistance they offer to analysis. The pathological struggle is waged between ego-impulses and sexual impulses. In a series of cases it appears as though conflict could exist between various purely sexual desires; but that is really the same thing, for of the two sexual desires involved in the conflict, one is always considerate of the ego, while the other demands that the ego be denied, and so it remains a conflict between the ego and sexuality.

Again and again when psychoanalysis claimed that psychological event was the result of sexual impulses, indignant protest was raised that in psychic life there were other impulses and interests besides the sexual, that everything could not be derived from sexuality, etc. Well, it is a great pleasure to share for once the opinion of one's opponents. Psychoanalysis never forgot that non-sexual impulses exist. It insisted on the decided distinction between sexual and ego-impulses and maintained in the face of every objection not that neuroses arise from sexuality, but that they owe their origin to the conflict between sexuality and the ego. Psychoanalysis can have no reasonable motive for denying the existence or significance of ego-impulses, even though it investigates the influence sexual impulses play in illness and in life. Only it has been destined to deal primarily with sexual impulses, because transference neuroses have furnished the readiest access to their investigation, and because it had become obligatory to study what others had neglected.

It does not follow, either, that psychoanalysis has never occupied itself at all with the non-sexual side of personality. The very distinction of the ego from sexuality has shown most clearly that the ego-impulses also pass through a significant development, which is by no means entirely independent of the development of the libido, nor does it fail to exert a reaction upon it. To be sure, we know much less about the evolution of the

ego than about libido development, for so far only the study of narcistic neuroses has promised to throw light on the structure of the ego. There is extant the notable attempt of Ferenczi to construct theoretically the stages of ego development, and furthermore we already possess two fixed points from which to proceed in our evolution of this development. We do not dream of asserting that the libidinous interests of a person are from the outset opposed to the interests of self-preservation; in every stage, rather, the ego will strive to remain in harmony with its sexual organization at that time, and accommodate itself thereto. The succession of the separate phases of development of libido probably follows a prescribed program; but we cannot deny that this sequence can be influenced by the ego, and that a certain parallelism of the phases of development of the ego and the libido may also be assumed. Indeed, the disturbance of this parallelism could become a pathological factor. One of the most important insights we have to gain is the nature of the attitude which the ego exhibits when an intensive fixation of its libido is left behind in one stage of its development. It may countenance the fixation and accordingly become perverse or, what amounts to the same thing, become infantile. Or it may be averse to this attachment of the libido, the result of which is that wherever the libido is subject to *fixation*, there the ego undergoes *suppression*.

In this way we reach the conclusion that the third factor of the etiology of neuroses is the tendency to *conflict*, upon which the development both of the ego and libido are dependent. Our insight into the causation of the neuroses has therefore been amplified. First, the most generalized factor, self-denial, then the fixation of the libido, by which it is forced into certain directions, and thirdly, the tendency to conflict in the development of the ego, which has rejected libidinous impulses of this kind. The state of affairs is therefore not so confused and difficult to see through, as you may have imagined it to be in the course of my explanation. But of course we are to discover that we have not, as yet, reached the end. We must add still a new factor and further analyze one we already know.

To show you the influence of ego development in the formation of a conflict, and so to give an illustration of the causation of neuroses, I should like to cite an example which, although it is entirely imaginary, is not far removed from probability in any respect. Drawing upon the title of a farce by Nestroy, I shall label this example “On the ground floor and in

the first story." The janitor lives on the ground floor, while the owner of the house, a rich, distinguished man, occupies the first story. Both have children, and we shall assume that the owner permits his little daughter to play unwatched with the child of the people. Then it may easily happen that the games of the children become "naughty," that is, they assume a sexual character; they play "father and mother," watch each other in the performance of intimate performances and mutually stimulate their genitals. The janitor's daughter, who, in spite of her five or six years of age, has had occasion to make observations on the sexuality of adults, probably played the part of the seducer. These experiences, even though they be of short duration, are sufficient to set in motion certain sexual impulses in both children, which continue in the form of onanism for several years after the common games have ceased. So far the consequences are similar; the final result will be very different. The janitor's daughter will continue onanism possibly to the commencement of her periods, abandon it then without difficulty, not many years later find a lover, perhaps bear a child, choose this or that path of life, which may likely enough make of her a popular artist who ends as an aristocrat. Perhaps the outcome will be less brilliant, but at any rate she will work out her life, free from neurosis, unharmed by her premature sexual activity. Very different is the effect on the other child. Even while she is very young she will realize vaguely that she has done wrong. In a short while, perhaps only after a violent struggle, she will renounce the gratification of onanism, yet still retain an undercurrent of depression in her attitude. If, during her early childhood, she chances to learn something about sexual intercourse, she will turn away in explicable disgust and seek to remain innocent. Probably she is at the time subjected anew to an irresistible impulse to onanism, of which she does not dare to complain. When the time arrives for her to find favor in the eyes of a man, a neurosis will suddenly develop and cheat her out of marriage and the joy of life. When analysis succeeds in gaining insight into this neurosis, it will reveal that this well-bred, intelligent girl of high ideals, has completely suppressed her sexual desires, but that unconsciously they cling to the meager experiences she had with the friend of her childhood.

The difference of these two destinies, arising from the same experience, is due to the fact that one ego has experienced development while the other has not. The janitor's daughter in later years looks upon sexual

intercourse as the same natural and harmless thing it had seemed in her childhood. The owner's daughter had experienced the influence of education and had recognized its claims. Thus stimulated, her ego had forged its ideals of womanly purity and lack of desire which, however, could not agree with any sexual activity; her intellectual development had made unworthy her interest in the woman's part she was to play. This higher moral and intellectual evolution of her ego was in conflict with the claims of her sexuality.

I should like to consider today one more point in the development of the ego, partly because it opens wide vistas, partly because it will justify the sharp, perhaps unnatural line of division we are wont to draw between sexual and ego impulses. In estimating the several developments of ego and of libido, we must emphasize an aspect which has not frequently been appreciated heretofore. Both the ego and the libido are fundamentally heritages, abbreviated repetitions of an evolution which mankind has, in the course of long periods of time, traversed from primeval ages. The libido shows its phylogenetic origin most readily, I should say. Recall, if you please, that in one class of animals the genital apparatus is closely connected with the mouth, that in another it cannot be separated from the excretory apparatus, and in others it is attached to organs of locomotion. Of all these things you will find a most fascinating description in the valuable book of W. Bölsche. Animals portray, so to speak, all kinds of perversions which have become set as their permanent sexual organizations. In man this phylogenetic aspect is partly clouded by the circumstance that these activities, although fundamentally inherited, are achieved anew in individual development, presumably because the same conditions still prevail and still continue to exert their influence on each personality. I should say that originally they served to call forth an activity, where they now serve only as a stimulus for recollection. There is no doubt that in addition the course of development in each individual, which has been innately determined, may be disturbed or altered from without by recent influences. That power which has forced this development upon mankind, and which today maintains the identical pressure, is indeed known to us: it is the same self-denial enforced by the realities — or, given its big and actual name, *Necessity*, the struggle for existence, the ‘Ανάγχη. This has been a severe teacher, but under him we have become potent. The neurotics are those children upon whom this

severity has had a bad effect — but there is risk in all education. This appreciation of the struggle of life as the moving force of development need not prejudice us against the importance of "innate tendencies in evolution" if their existence can be proved.

It is worth noting that sexual instincts and instincts of self-preservation do not behave similarly when they are confronted with the necessities of actuality. It is easier to educate the instincts of self-preservation and everything that is connected with them; they speedily learn to adapt themselves to necessity and to arrange their development in accordance with the mandates of fact. That is easy to understand, for they cannot procure the objects they require in any other way; without these objects the individual must perish. The sex instincts are more difficult to educate because at the outset they do not suffer from the need of an object. As they are related almost parasitically to the other functions of the body and gratify themselves auto-erotically by way of their own body, they are at first withdrawn from the educational influence of real necessity. In most people, they maintain themselves in some way or other during the entire course of life as those characteristics of obstinacy and inaccessibility to influence which are generally collectively called unreasonableness. The education of youth generally comes to an end when the sexual demands are aroused to their full strength. Educators know this and act accordingly; but perhaps the results of psychoanalysis will influence them to transfer the greatest emphasis to the education of the early years, of childhood, beginning with the suckling. The little human being is frequently a finished product in his fourth or fifth year, and only reveals gradually in later years what has long been ready within him.

To appreciate the full significance of the aforementioned difference between the two groups of instincts, we must digress considerably and introduce a consideration which we must needs call *economic*. Thereby we enter upon one of the most important but unfortunately one of the most obscure domains of psychoanalysis. We ask ourselves whether a fundamental purpose is recognizable in the workings of our psychological apparatus, and answer immediately that this purpose is the pursuit of pleasurable excitement. It seems as if our entire psychological activity were directed toward gaining pleasurable stimulation, toward avoiding painful ones; that it is regulated automatically by the *principle of pleasure*. Now we should like to know, above all, what conditions cause the creation

of pleasure and pain, but here we fall short. We may only venture to say that pleasurable excitation *in some way* involves lessening, lowering or obliterating the amount of stimuli present in the psychic apparatus. This amount, on the other hand, is increased by pain. Examination of the most intense pleasurable excitement accessible to man, the pleasure which accompanies the performance of the sexual act, leaves small doubt on this point. Since such processes of pleasure are concerned with the destinies of quantities of psychic excitation or energy, we call considerations of this sort economic. It thus appears that we can describe the tasks and performances of the psychic apparatus in different and more generalized terms than by the emphasis of the pursuit of pleasure. We may say that the psychic apparatus serves the purpose of mastering and bringing to rest the mass of stimuli and the stimulating forces which approach it. The sexual instincts obviously show their aim of pleasurable excitement from the beginning to the end of their development; they retain this original function without much change. The ego instincts strive at first for the same thing. But through the influence of their teacher, necessity, the ego instincts soon learn to adduce some qualification to the principle of pleasure. The task of avoiding pain becomes an objective almost comparable to the gain of pleasure; the ego learns that its direct gratification is unavoidably withheld, the gain of pleasurable excitement postponed, that always a certain amount of pain must be borne and certain sources of pleasure entirely relinquished. This educated ego has become "reasonable." It is no longer controlled by the principle of pleasure, but by the *principle of fact*, which at bottom also aims at pleasure, but pleasure which is postponed and lessened by considerations of fact.

The transition from the pleasure principle to that of fact is the most important advance in the development of the ego. We already know that the sexual instincts pass through this stage unwillingly and late. We shall presently learn the consequence to man of the fact that his sexuality admits of such a loose relation to the external realities of his life. Yet one more observation belongs here. Since the ego of man has, like the libido, its history of evolution, you will not be surprised to hear that there are "ego-regressions," and you will want to know what role this return of the ego to former phases of development plays in neurotic disease.

TWENTY-THIRD LECTURE. GENERAL THEORY OF THE NEUROSES

The Development of the Symptoms

IN the layman's eyes the symptom shows the nature of the disease, and cure means removal of symptoms. The physician, however, finds it important to distinguish the symptoms from the disease and recognizes that doing away with the symptoms is not necessarily curing the disease. Of course, the only tangible thing left over after the removal of the symptoms is the capacity to build new symptoms. Accordingly, for the time being, let us accept the layman's viewpoint and consider the understanding of the symptoms as equivalent to the understanding of the sickness.

The symptoms, — of course, we are dealing here with psychic (or psychogenic) symptoms, and psychic illness — are acts which are detrimental to life as a whole, or which are at least useless; frequently they are obnoxious to the individual who performs them and are accompanied by distaste and suffering. The principal injury lies in the psychic exertion which they cost, and in the further exertion needed to combat them. The price these efforts exact may, when there is an extensive development of the symptoms, bring about an extraordinary impoverishment of the personality of the patient with respect to his available psychic energy, and consequently cripple him in all the important tasks of life. Since such an outcome is dependent on the amount of energy so utilized, you will readily understand that "being sick" is essentially a practical concept. But if you take a theoretical standpoint and disregard these quantitative relations, you can readily say that we are all sick, or rather neurotic, since the conditions favorable to the development of symptoms are demonstrable also among normal persons.

As to the neurotic symptoms, we already know that they are the result of a conflict aroused by a new form of gratifying the libido. The two forces that have contended against each other meet once more in the symptom; they become reconciled through the compromise of a symptom development. That is why the symptom is capable of such resistance; it is sustained from both sides. We also know that one of the two partners to the conflict is the unsatisfied libido, frustrated by reality, which must now

seek other means for its satisfaction. If reality remains inflexible even where the libido is prepared to take another object in place of the one denied it, the libido will then finally be compelled to resort to regression and to seek gratification in one of the earlier stages in its organizations already out-lived, or by means of one of the objects given up in the past. Along the path of regression the libido is enticed by fixations which it has left behind at these stages in its development.

Here the development toward perversion branches off sharply from that of the neuroses. If the regressions do not awaken the resistance of the ego, then a neurosis does not follow and the libido arrives at some actual, even if abnormal, satisfaction. The ego, however, controls not alone consciousness, but also the approaches to motor innervation, and hence the realization of psychic impulses. If the ego then does not approve this regression, the conflict takes place. The libido is locked out, as it were, and must seek refuge in some place where it can find an outlet for its fund of energy, in accordance with the controlling demands for pleasurable gratification. It must withdraw from the ego. Such an evasion is offered by the fixations established in the course of its evolution and now traversed regressively, against which the ego had, at the time, protected itself by suppressions. The libido, streaming back, occupies these suppressed positions and thus withdraws from before the ego and its laws. At the same time, however, it throws off all the influences acquired under its tutelage. The libido could be guided so long as there was a possibility of its being satisfied; under the double pressure of external and internal denial it becomes unruly and harks back to former and more happy times. Such is its character, fundamentally unchangeable. The ideas which the libido now takes over in order to hold its energy belong to the system of the unconscious, and are therefore subject to its peculiar processes, especially elaboration and displacement. Conditions are set up here which are entirely comparable to those of dream formation. Just as the latent dream, the fulfillment of a wish-phantasy, is first built up in the unconsciousness, but must then pass through conscious processes before, censored and approved, it can enter into the compromise construction of the manifest dream, so the ideas representing the libido in the unconscious must still contend against the power of the fore-conscious ego. The opposition that has arisen against it in the ego follows it down by a “counter-siege” and forces it to choose such an expression as will serve at the same time to

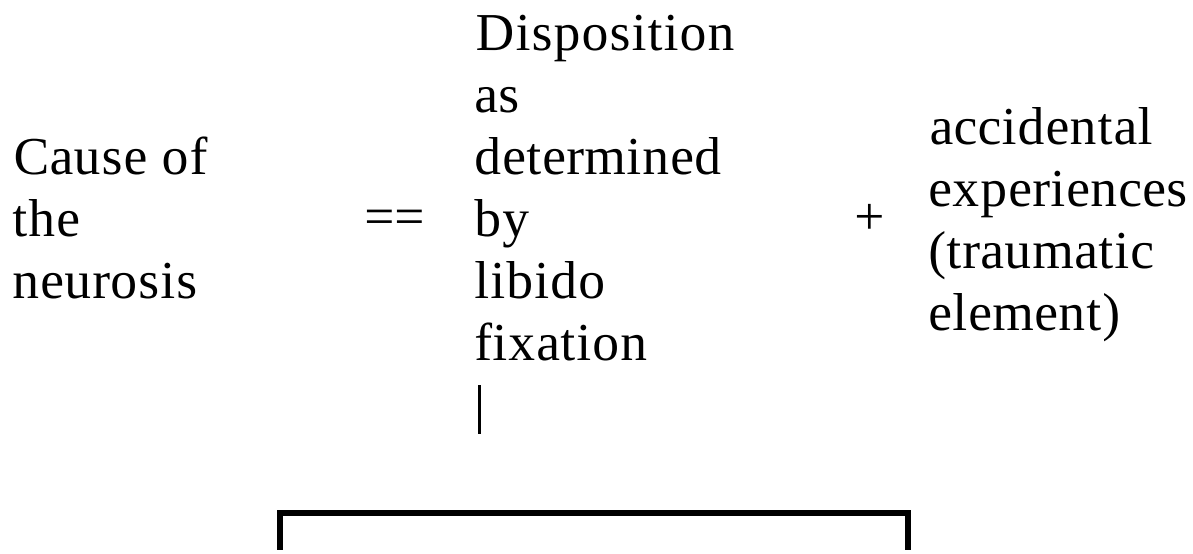
express itself. Thus, then, the symptom comes into being as a much distorted offshoot from the unconscious libidinous wish-fulfillment, an artificially selected ambiguity — with two entirely contradictory meanings. In this last point alone do we realize a difference between dream and symptom development, for the only fore-conscious purpose in dream formation is the maintenance of sleep, the exclusion from consciousness of anything which may disturb sleep; but it does not necessarily oppose the unconscious wish impulse with an insistent "No." Quite the contrary; the purpose of the dream may be more tolerant, because the situation of the sleeper is a less dangerous one. The exit to reality is closed only through the condition of sleep.

You see, this evasion which the libido finds under the conditions of the conflict is possible only by virtue of the existing fixations. When these fixations are taken in hand by the regression, the suppression is side-tracked and the libido, which must maintain itself under the conditions of the compromise, is led off or gratified. By means of such a detour by way of the unconscious and the old fixations, the libido has at last succeeded in breaking its way through to some sort of gratification, however extraordinarily limited this may seem and however unrecognizable any longer as a genuine satisfaction. Now allow me to add two further remarks concerning this final result. In the first place, I should like you to take note of the intimate connection between the libido and the unconscious on the one hand, and on the other of the ego, consciousness, and reality. The connection that is evidenced here, however, does not indicate that originally they in any way belong together. I should like you to bear continually in mind that everything I have said here, and all that will follow, pertains only to the symptom development of hysterical neurosis.

Where, now, can the libido find the fixations which it must have in order to force its way through the suppressions? In the activities and experiences of infantile sexuality, in its abandoned component-impulses, its childish objects which have been given up. The libido again returns to them. The significance of this period of childhood is a double one; on the one hand, the instinctive tendencies which were congenital in the child first showed themselves at this time; secondly, at the same time, environmental influences and chance experiences were first awakening his other instincts. I believe our right to establish this bipartite division cannot be questioned. The assertion that the innate disposition plays a part is

hardly open to criticism, but analytic experience actually makes it necessary for us to assume that purely accidental experiences of childhood are capable of leaving fixations of the libido. I do not see any theoretical difficulties here. Congenital tendencies undoubtedly represent the after-effects of the experiences of an earlier ancestry; they must also have once been acquired; without such acquired characters there could be no heredity. And is it conceivable that the inheritance of such acquired characters comes to a standstill in the very generation that we have under observation? The significance of infantile experience, however, should not, as is so often done, be completely ignored as compared with ancestral experiences or those of our adult years; on the contrary, they should meet with an especial appreciation. They have such important results because they occur in the period of uncompleted development, and because of this very fact are in a position to cause a traumatic effect. The researches on the mechanics of development by Roux and others have shown us that a needle prick into an embryonic cell mass which is undergoing division results in most serious developmental disturbances. The same injury to a larva or a completed animal can be borne without injury.

The libido fixation of adults, which we have referred to as representative of the constitutional factor in the etiological comparison of the neuroses, can be thought of, so far as we are concerned, as divisible into two separate factors, the inherited disposition and the tendency acquired in early childhood. We know that a schematic representation is most acceptable to the student. Let us combine these relations as follows:



Sexual constitution (pre-historic experience)

Infantile experience

The hereditary sexual constitution provides us with manifold tendencies, varying with the special emphasis given one or the other component of the instinct, either individually or in combination. With the factor of infantile experience, there is again built up a complementary series within the sexual constitution which is perfectly comparable with our first series, namely, the gradations between disposition and the chance experiences of the adult. Here again we find the same extreme cases and similar relations in the matter of substitution. At this point the question becomes pertinent as to whether the most striking regressions of the libido, those which hark back to very early stages in sexual organization, are not essentially conditioned by the hereditary constitutional factor. The answer to this question, however, may best be put off until we are in a position to consider a wider range in the forms of neurotic disease.

Let us devote a little time to the consideration of the fact that analytic investigation of neurotics shows the libido to be bound up with the infantile sexual experiences of these persons. In this light they seem of enormous importance for both the life and health of mankind. With respect to therapeutic work their importance remains undiminished. But when we do not take this into account we can herein readily recognize the danger of being misled by the situation as it exists in neurotics into adopting a mistaken and one-sided orientation toward life. In figuring the importance of the infantile experiences we must also subtract the influences arising from the fact that the libido has returned to them by regression, after having been forced out of its later positions. Thus we approach the opposite conclusion, that experiences of the libido had no importance whatever in their own time, but rather acquired it at the time of regression.

You will remember that we were led to a similar alternative in the discussion of the Oedipus-complex.

A decision on this matter will hardly be difficult for us. The statement is undoubtedly correct that the hold which the infantile experiences have on the libido — with the pathogenic influences this involves — is greatly augmented by the regression; still, to allow them to become definitive would nevertheless be misleading. Other considerations must be taken into account as well. In the first place, observation shows, in a way that leaves no room for doubt, that infantile experiences have their particular significance which is evidenced already during childhood. There are, furthermore, neuroses in children in which the factor of displacement in time is necessarily greatly minimized or is entirely lacking, since the illness follows as an immediate consequence of the traumatic experience. The study of these infantile neuroses keeps us from many dangerous misunderstandings of adult neuroses, just as the dreams of children similarly serve as the key to the understanding of the dreams of adults. As a matter of fact, the neuroses of children are very frequent, far more frequent than is generally believed. They are often overlooked, dismissed as signs of badness or naughtiness, and often suppressed by the authority of the nursery; in retrospect, however, they may be easily recognized later. They occur most frequently in the form of *anxiety hysteria*. What this implies we shall learn upon another occasion. When a neurosis breaks out in later life, analysis regularly shows that it is a direct continuation of that infantile malady which had perhaps developed only obscurely and incipiently. However, there are cases, as already stated, in which this childish nervousness continues, without any interruption, as a lifelong affliction. We have been able to analyze a very few examples of such neuroses during childhood, while they were actually going on; much more often we had to be satisfied with obtaining our insight into the childhood neurosis subsequently, when the patient is already well along in life, under conditions in which we are forced to work with certain corrections and under definite precautions.

Secondly, we must admit that the universal regression of the libido to the period of childhood would be inexplicable if there were nothing there which could exert an attraction for it. The fixation which we assume to exist towards specific developmental phases, conveys a meaning only if we think of it as stabilizing a definite amount of libidinous energy. Finally,

I am able to remind you that here there exists a complementary relationship between the intensity and the pathogenic significance of the infantile experiences to the later ones which is similar to that studied in previous series. There are cases in which the entire causal emphasis falls upon the sexual experiences of childhood, in which these impressions take on an effect which is unmistakably traumatic and in which no other basis exists for them beyond what the average sexual constitution and its immaturity can offer. Side by side with these there are others in which the whole stress is brought to bear by the later conflicts, and the emphasis the analysis places on childhood impressions appears entirely as the work of regression. There are also extremes of “retarded development” and “regression,” and between them every combination in the interaction of the two factors.

These relations have a certain interest for that pedagogy which assumes as its object the prevention of neuroses by an early interference in the sexual development of the child. So long as we keep our attention fixed essentially on the infantile sexual experiences, we readily come to believe we have done everything for the prophylaxis of nervous afflictions when we have seen to it that this development is retarded, and that the child is spared this type of experience. Yet we already know that the conditions for the causation of neuroses are more complicated and cannot in general be influenced through one single factor. The strict protection in childhood loses its value because it is powerless against the constitutional factor; furthermore, it is more difficult to carry out than the educators imagine, and it brings with it two new dangers that cannot be lightly dismissed. It accomplishes too much, for it favors a degree of sexual suppression which is harmful for later years, and it sends the child into life without the power to resist the violent onset of sexual demands that must be expected during puberty. The profit, therefore, which childhood prophylaxis can yield is most dubious; it seems, indeed, that better success in the prevention of neuroses can be gained by attacking the problem through a changed attitude toward facts.

Let us return to the consideration of the symptoms. They serve as substitutes for the gratification which has been forborne, by a regression of the libido to earlier days, with a return to former development phases in their choice of object and in their organization. We learned some time ago that the neurotic is held fast somewhere in his past; we now know that it is

a period of his past in which his libido did not miss the satisfaction which made him happy. He looks for such a time in his life until he has found it, even though he must hark back to his suckling days as he retains them in his memory or as he reconstructs them in the light of later influences. The symptom in some way again yields the old infantile form of satisfaction, distorted by the censoring work of the conflict. As a rule it is converted into a sensation of suffering and fused with other causal elements of the disease. The form of gratification which the symptom yields has much about it that alienates one's sympathy. In this we omit to take into account, however, the fact that the patients do not recognize the gratification as such and experience the apparent satisfaction rather as suffering, and complain of it. This transformation is part of the psychic conflict under the pressure of which the symptom must be developed. What was at one time a satisfaction for the individual must now awaken his antipathy or disgust. We know a simple but instructive example for such a change of feeling. The same child that sucked the milk with such voracity from its mother's breast is apt to show a strong antipathy for milk a few years later, which is often difficult to overcome. This antipathy increases to the point of disgust when the milk, or any substituted drink, has a little skin over it. It is rather hard to throw out the suggestion that this skin calls up the memory of the mother's breast, which was once so intensely coveted. In the meantime, to be sure, the traumatic experience of weaning has intervened.

There is something else that makes the symptoms appear remarkable and inexplicable as a means of libidinous satisfaction. They in no way recall anything from which we normally are in the habit of expecting satisfaction. They usually require no object, and thereby give up all connection with external reality. We understand this to be a result of turning away from fact and of returning to the predominance of pleasurable gratification. But it is also a return to a sort of amplified autoeroticism, such as was yielded the sex impulse in its earliest satisfactions. In the place of a modification in the outside world, we have a physical change, in other words, an internal reaction in place of an external one, an adjustment instead of an activity. Viewed from a phylogenetic standpoint, this expresses a very significant regression. We will grasp this better when we consider it in connection with a new factor which we are still to discover from the analytic investigation of symptom

development. Further, we recall that in symptom formation the same processes of the unconscious have been at work as in dream formation — elaboration and displacement. Similarly to the dream, the symptom represents a fulfillment, a satisfaction after the manner of the infantile; by the utmost elaboration this satisfaction can be compressed into a single sensation or innervation, or by extreme displacement it may be restricted to a tiny element of the entire libidinous complex. It is no wonder that we often have difficulties in recognizing in the symptom the libidinous satisfaction which we anticipate and always find verified.

I have indicated that we must still become familiar with a new factor. It is something really surprising and confusing. You know that by analysis of the symptoms we arrive at a knowledge of the infantile experiences upon which the libido is fixated and out of which the symptoms are formed. Well, the surprising thing is this, that these infantile scenes are not always true. Indeed, in the majority of cases they are untrue, and in some instances they are directly contrary to historical truth. You see that this discovery, as no other, serves either to discredit the analysis which has led to such a result, or to discredit the patients upon whose testimony the analysis, as well as the whole understanding of neuroses, is built up. In addition there is something else utterly confusing about it. If the infantile experiences, revealed by analysis, were in every case real, we should have the feeling of walking on sure ground; if they were regularly falsified, disclosed themselves as inventions or phantasies of the patients, we should have to leave this uncertain ground and find a surer footing elsewhere. But it is neither the one nor the other, for when we look into the matter we find that the childhood experiences which are recalled or reconstructed in the course of the analysis may in some in some instances be false, in others undeniably true, and in the majority of cases a mixture of truth and fiction. The symptoms then are either the representation of actual experiences to which we may ascribe an influence in the fixation of the libido, or the representation of phantasies of the patient which, of course, can be of no etiological significance. It is hard to find one’s way here. The first foothold is given perhaps by an analogous discovery, namely, that the same scattered childhood memories that individuals always have had and have been conscious of prior to an analysis may be falsified as well, or at least may contain a generous mixture of true and false. Evidence of error very seldom offers difficulties, and we at least gain the satisfaction of

knowing that the blame for this unexpected disappointment is not to be laid at the door of analysis, but in some way upon the patients.

After reflecting a bit we can easily understand what is so confusing in this matter. It is the slight regard for reality, the neglect to keep fact distinct from phantasy. We are apt to feel insulted that the patient has wasted our time with invented tales. There is an enormous gap in our thinking between reality and invention and we accord an entirely different valuation to reality. The patient, too, takes this same viewpoint in his normal thinking. When he offers the material which, by way of the symptom, leads back to the wish situations which are modeled upon the childhood experiences, we are at first, to be sure, in doubt whether we are dealing with reality or with phantasy. Later certain traits determine this decision; we are confronted with the task of acquainting the patient with them. This can never be accomplished without difficulty. If at the outset we tell him that he is going to reveal phantasies with which he has veiled his childhood history, just as every people weaves myths around its antiquity, we notice (to our comfort) that his interest in the further pursuit of the subject suddenly diminishes. He, too, wants to discover realities, and despises all "notions." But if until this is accomplished we allow him to believe that we are investigating the actual occurrences of his childhood, we run the risk of later being charged with error and with our apparent gullibility. For a long time he is unable to reconcile himself to the idea of considering phantasy and reality on equal terms and he tends, with reference to the childish experiences to be explained, to neglect for the time being the difference between the real and the imaginary. And yet this is obviously the only correct attitude toward these psychological products because they are, in a sense, real. It is a fact that the patient is able to create such phantasies for himself, and this is of scarcely less importance for his neurosis than if he had really undergone the experience which he imagines. These phantasies possess *psychological* reality in contrast to *physical* reality, and so we gradually come to understand that *in the realm of neuroses the psychological reality is the determining factor*.

Among the experiences which recur continually in the early history of neurotics and, in fact, are never lacking, some are of particular significance and accordingly I consider them worthy of special treatment. I shall enumerate a few examples of this species: observation of the parental intercourse, seduction by an adult, and the threat of castration. It

would be a grievous error to assume that physical reality can never be accorded them; this may often be proved beyond doubt by the testimony of adult relatives. So, for example, it is not at all unusual if the little boy who begins to play with his penis, and does not yet know that one must conceal this, is threatened by his parents or nurse with the cutting off of the organ or the guilty hand. Parents often admit upon questioning that they thought they had done the right thing by this intimidation; many individuals retain a correct, conscious memory of these threats, especially if it has occurred in later childhood. When the mother or some other woman makes the threat she usually delegates the responsibility of executing it to the father or to the doctor. In the famous *Struwelpeter* by the pediatrist Hoffman, of Frankfort, rhymes which owe their popularity to his very fine understanding of the sexual and other complexes of childhood, you find a milder substitute for castration in the cutting off of the thumbs as a punishment for insistent sucking. But it is highly improbable that the threat of castration is actually made as often as it occurs in the analyses of neurotics. We are content to understand that the child imaginatively constructs this threat for himself from suggestions, from the knowledge that auto-erotic satisfaction is forbidden, and from the impression of castration he has received in discovering the female genital. It is, moreover, in no way impossible that the little child, so long as he is not credited with any understanding or memory, will, even in families outside the proletariat, become a witness to the sexual act between his parents or some other group-ups, and it cannot be disproved that the child *subsequently* understands this impression, and may react upon it. But when this intercourse is described with minute details which could hardly have been observed, or if it turns out to be, as it so frequently does, an intercourse which was not face to face, *more ferarum*, there is no longer any doubt that this phantasy is derived from the observation of the intercourse of animals (dogs) and the unsatisfied curiosity of the child in his period of puberty. The greatest feat of the imagination is the phantasy of having witnessed the coitus of the parents while still unborn in the mother’s womb. Of especial interest is the phantasy of having been seduced, because so often it is not a phantasy at all, but a real memory. But luckily it is not real so often as first appears from the results of analysis. Seduction by older children, or children of the same age, is much more frequent than seduction by adults, and if, in the case of little girls, the

father quite regularly appears as the seducer in the occurrences which they relate, neither the fantastic nature of this accusation nor its motive can be doubted. The child as a rule covers the autoerotic period of his sexual activity, where there has been no actual seduction, with the seduction-phantasy. He spares himself the shame of onanism by imagining the presence of an object for his desires in that early period. As a matter of fact, you must not be misled in attributing sexual misuse of the child by its nearest male relatives solely and always to phantasy. Most analysts have probably treated cases in which such relations were real and could be proved beyond doubt, with the qualification that in such cases they belong to the later years of childhood and were transposed to an earlier time.

We cannot avoid the impression that such experiences of childhood are in some way necessary to the neurosis, that they are claimed by its iron rule. If they exist in reality, then well and good, but if reality has withheld them they are constructed from suggestions and supplemented by the imagination. The result is the same, and to this day we have been unable to trace any difference in the results, whether fancy or fact played the larger part in these childish occurrences. Here again we encounter one of the complementary relationships so frequently met with; it is, to be sure, the most estranging of all those we have become acquainted with. Whence comes the need for these phantasies, and the material for them? There can be no doubt as to the sources of the impulse, but we must explain why the same phantasies are always created with the same content. I have an answer in readiness which I know you will think very far-fetched. I am of the opinion that these *primal phantasies* — so I should like to term these, and certainly some others also — are a phylogenetic possession. In them the individual reaches out beyond his own life, into the experiences of antiquity, where his own experience has become all too rudimentary. It seems very possible to me that everything which is obtained during an analysis in the guise of phantasy, the seduction of children, the release of sexual excitement by watching parental intercourse, the threat of castration — or rather castration itself — were once realities in the primeval existence of mankind and that the imaginative child is merely filling in the gaps of individual truth with prehistoric truth. We have again and again suspected that the psychology of neuroses stores up more of the antiquities of human development than all other sources.

What we have just discussed makes it necessary for us to enter further into the origin and significance of that mental activity that is called imagination. As you well know, it enjoys universal esteem, although we have never clearly understood its place in the psychic life. I have this much to say about it. As you know, the ego of man is slowly educated by the influence of external necessity to an appreciation of reality and a pursuit of the principle of reality, and must therefore renounce temporarily or permanently various objects and goals of its strivings for satisfaction, sexual and otherwise. But renunciation of gratification has always been difficult for man. He cannot accomplish it without something in the nature of compensation. Accordingly he has reserved for himself a psychological activity wherein all these abandoned sources of pleasures and means of pleasurable gratification are granted a further existence, a form of existence in which they are freed from the requirements of reality and what we like to call the test of reality. Every impulse is soon transformed into the form of its own fulfillment. There is no doubt that dwelling on the imagined fulfillment of a given wish affords some satisfaction, although the realization that it is unreal is unobscured. In the activity of the imagination, man enjoys that freedom from external compulsion that he has long since renounced. He has made it possible to be alternately a pleasure-seeking animal and a reasoning human being. He finds that the scant satisfaction that he can force out of reality is not enough. “There is no getting along without auxiliary-constructions,” Th. Fontaine once said. The creation of the psychic realm of fancy has its complete counterpart in the establishment of “preserves” and “conservation projects” in those places where the demands of husbandry, traffic and industry threaten quickly to change the original face of the earth into something unrecognizable. The national reserves maintain this old condition of things, which otherwise has everywhere been regretfully sacrificed to necessity. Everything may grow and spread there as it will, even that which is useless and harmful. The psychic realm of phantasy is such a reservation withdrawn from the principles of reality.

The best known productions of phantasy are the so-called “day dreams,” which we already know, pictured satisfactions of ambitious, of covetous and erotic wishes, which flourish the more grandly the more reality admonishes them to modesty and patience. There is unmistakably shown in them the nature of imaginative happiness, the restoration of the

independence of pleasurable gratification from the acquiescence of reality. We know such day dreams are nuclei and models for the dreams of night. The night dream is essentially nothing but a day dream, distorted by the nocturnal forms of psychological activity, and made available by the freedom which the night gives to instinctive impulses. We have already become acquainted with the idea that a day dream is not necessarily conscious, that there are also unconscious day dreams. Such unconscious day dreams are as much the source of night dreams as of neurotic symptoms.

The significance of phantasy for the development of symptoms will become clear to you by the following: We have said that in a case of renunciation, the libido occupies regressively the positions once abandoned by it, to which, nevertheless, it has clung in certain ways. We shall neither retract this statement nor correct it, but we shall insert a missing link. How does the libido find its way to these points of fixation? Well, every object and tendency of the libido that has been abandoned, is not abandoned in every sense of the word. They, or their derivatives, are still held in presentations of the phantasy, with a certain degree of intensity. The libido need only retire to the imagination in order to find from them the open road to all suppressed fixations. These phantasies were happy under a sort of tolerance, there was no conflict between them and the ego, no matter how acute the contrast, so long as a certain condition was observed — a condition *quantitative* in nature that is now disturbed by the flowing back of the libido to the phantasies. By this addition the accumulation of energy in the phantasies is heightened to such a degree that they become assertive and develop a pressure in the direction of realization. But that makes a conflict between them and the ego inevitable. Whether formerly conscious or unconscious, they now are subject to suppression by the ego and are victims to the attraction of the unconscious. The libido wanders from phantasies now unconscious to their sources in unconsciousness, and back to its own points of fixation.

The return of the libido to phantasy is an intermediate step on the road to symptom development and well deserves a special designation. C. G. Jung coined for it the very appropriate name of *introversion,* but inappropriately he also lets it stand for other things. Let us therefore retain the idea that introversion signifies the turning aside of the libido from the possibilities of actual satisfaction and the excessive accumulation of the

phantasies hitherto tolerated as harmless. An introvert is not yet a neurotic, but he finds himself in a labile situation; he must develop symptoms at the next dislocation of forces, if he does not find other outlets for his pent-up libido. The intangible nature of neurotic satisfaction and the neglect of the difference between imagination and reality are already determined by arrest in the phase of introversion.

You have certainly noticed that in the last discussions I have introduced a new factor into the structure of the etiological chain, namely, the quantity, the amount of energy that comes under consideration. We must always take this factor into account. Purely qualitative analysis of the etiological conditions is not sufficient. Or, to put it in another way, a *dynamic* conception alone of these psychic processes is not enough; there is need of an *economic* viewpoint. We must say to ourselves that the conflict between two impulses is not released before certain occupation-intensities have been reached, even though the qualitative conditions have long been potent. Similarly, the pathogenic significance of the constitutional factors is guided by how much *more* of a given component impulse is present in the predisposition over and above that of another; one can even conceive the predispositions of all men to be qualitatively the same and to be differentiated only by these quantitative conditions. The quantitative factor is no less important for the power of resistance against neurotic ailments. It depends upon *what amount* of unused libido a person can hold freely suspended, and upon *how large a fraction* of the libido he is able to direct from the sexual path to the goal of sublimation. The final goal of psychological activity, which may be described qualitatively as striving towards pleasure-acquisition and avoidance of unpleasantness, presents itself in the light of economic considerations as the task of overcoming the gigantic stimuli at work in the psychological apparatus, and to prevent those obstructions which cause unpleasantness.

So much I wanted to tell you about symptom development in the neuroses. Yes, but do not let me neglect to emphasize this especially: everything I have said here relates to the symptom development in hysteria. Even in compulsion neuroses, which retain the same fundamentals, much is found that is different. The counter-siege directed against the claims of the instincts, of which we have spoken in connection with hysteria, press to the fore in compulsion neuroses, and control the clinical picture by means of so-called “reaction-formations.” The same

kind and more far-reaching variations are discoverable among the other neuroses, where the investigations as to the mechanism of symptom development have in no way been completed.

Before I leave you today I should like to have your attention for a while for an aspect of imaginative life which is worthy of the most general interest. For there is a way back from imagination to reality and that is — art. The artist is an incipient introvert who is not far from being a neurotic. He is impelled by too powerful instinctive needs. He wants to achieve honor, power, riches, fame and the love of women. But he lacks the means of achieving these satisfactions. So like any other unsatisfied person, he turns away from reality, and transfers all his interests, his libido, too, to the elaboration of his imaginary wishes, all of which might easily point the way to neurosis. A great many factors must combine to present this termination of his development; it is well known how often artists especially suffer from a partial inhibition of their capacities through neurosis. Apparently their constitutions are strongly endowed with an ability to sublimize and to shift the suppression determining their conflicts. The artist finds the way back to reality in this way. He is not the only one who has a life of imagination. The twilight-realm of phantasy is upheld by the sanction of humanity and every hungry soul looks here for help and sympathy. But for those who are not artists, the ability to obtain satisfaction from imaginative sources is very restricted. Their relentless suppressions force them to be satisfied with the sparse day dreams which may become conscious. If one is a real artist he has more at his disposal. In the first place, he understands how to elaborate his day dreams so that they lose their essentially personal element, which would repel strangers, and yield satisfaction to others as well. He also knows how to disguise them so that they do not easily disclose their origin in their despised sources. He further possesses the puzzling ability of molding a specific material into a faithful image of the creatures of his imagination, and then he is able to attach to this representation of his unconscious phantasies so much pleasurable gratification that, for a time at least, it is able to outweigh and release the suppressions. If he is able to accomplish all this, he makes it possible for others, in their return, to obtain solace and consolation from their own unconscious sources of gratification which had become inaccessible. He wins gratitude and admiration for himself and so, by means of his imagination, achieves the very things which had at first

only an imaginary existence for him: honor, power, and the love of women.

TWENTY-FOURTH LECTURE. GENERAL THEORY OF THE NEUROSES

Ordinary Nervousness

IN our last discussion we accomplish a difficult task. Now I shall temporarily leave our subject and address myself to you.

For I know quite well that you are dissatisfied. You thought that an introduction to psychoanalysis would be quite a different matter. You expected to hear vivid illustrations instead of theories. You will tell me that when I gave you the illustration of "on the ground floor in the first story," you had grasped something of the causation of neurosis, only of course this should have been a real observation and not an imaginary story. Or, when in the beginning I described two symptoms (not imaginary also, let us hope) whose analysis revealed a close connection with the life of the patient, you first came to grasp the meaning of the symptoms and you hoped that I would proceed in the same way. Instead I have given you theories — lengthy, difficult to see in perspective and incomplete, to which something new was constantly being added. I worked with conceptions that I had not previously presented to you, abandoned descriptive for dynamic conceptions, and these in turn for economic ones. I made it hard for you to understand how many of the artificial terms I made use of still carry the same meaning and are used interchangeably only for the sake of euphony. Finally, I allowed broad conceptions to pass in review before you: the principles of pleasure and of fact and their phylogenetically inherited possession; and then, instead of introducing you to definite facts, I allowed them to become increasingly vague till they seemed to fade into dim distances.

Why did I not begin my introduction to the theory of neurosis with the facts that you yourselves know about nervousness, with something that has always aroused your interest, with the peculiar temperament of nervous people, their incomprehensible reactions to external influences, to human intercourse, their irritability, their uselessness? Why did I not lead you step by step from the understanding of simple, everyday forms to the problems of mysterious and extreme manifestations of nervousness?

I cannot even say that you are wrong. I am not so infatuated with my art of representation as to see some special attraction in every blemish. I

myself believe that I could have proceeded differently, to your better advantage, and this indeed had been my intention. But one cannot always carry out one's sensible intentions. The nature of the subject matter issues its own commands, and easily modifies our plans. Even so usual a performance as the organization of well-known material is not entirely subject to the particular purposes of the author. It forms itself as it will and later one wonders why it turned out so and not otherwise.

Probably one of the reasons is that the title, *A General Introduction to Psychoanalysis*, no longer applies to this part, which deals with the neuroses. The introduction to psychoanalysis is found in the study of errors and the dream; the theory of neurosis is psychoanalysis itself. I do not think that in so short a time I could have given you a knowledge of the theory of neurosis other than in concentrated form. It was necessary to present to you connectedly the meaning and interpretation of the symptoms, their external and internal conditions and their bearing on the mechanism of symptom formation. This I have attempted to do; it is practically the nucleus of the material that modern psychoanalysis is able to offer. We had to say quite a good deal concerning the libido and its development, and something as well concerning the development of the ego. The introduction had already prepared you for the presuppositions of our technique, for the large aspects of the unconscious and of suppression (resistance). In a subsequent lecture you will learn from what points psychoanalysis proceeds organically. For the present I have not sought to hide from you the fact that all our results are based on the study of a single group of nervous affections, the so-called transference neuroses. Though you have gained no positive knowledge and have not retained every detail, still I hope that you have a fair picture of the methods, the problems and the results of psychoanalysis.

I have assumed that it was your wish for me to begin my presentation of neuroses with a description of nervous behavior, the nature of neurotic suffering, and the way in which the nervous meet the conditions of their illness and adapt themselves to these. Such subject matter is certainly interesting and well worth knowing. It is moreover not very hard to handle, yet it is not wise to begin with its consideration. There is danger of not discovering the unconscious, of overlooking the great significance of the libido, of judging all conditions as they appear to the ego of the nervous person. It is obvious that this ego is neither a reliable nor an

impartial authority. For this very ego is the force that denies and suppresses the unconscious; when the unconscious is concerned, how then could we expect justice to be done? The rejected claims of sexuality stand first in the line of these suppressions; it is natural that from the standpoint of the ego we can never learn their extent and significance. As soon as we attain to the point of view of suppression, we are sufficiently warned not to make one of the contending factions, above all not to make the victor judge of the struggle. We are prepared to find that the testimony of the ego may lead us astray. If one is to believe the evidence of the ego, it would appear to have been active all along, all its symptoms would have been actively willed and formed. Yet we know that it has passively allowed a great deal to occur, a fact which it subsequently seeks to conceal and to palliate. To be sure, it does not always attempt this; in the case of the symptoms of compulsion neurosis it must admit that it is being opposed by something alien, which it can resist only with difficulty.

Whoever does not heed these warnings not to mistake the prevarications of the ego for truth, has clear sailing; he avoids all the resistances which oppose the psychoanalytic emphasis upon the unconscious, on sexuality, and on the passiveness of the ego. He will assert with Alfred Adler that the “nervous character” is the cause instead of the result of the neurosis, but he will not be able to explain a single detail of symptom formation or to interpret a single dream.

You will ask: Is it not possible to do justice to the part the ego plays in nervousness and in symptom formation without crudely neglecting the factors revealed by psychoanalysis? I answer you: Surely it must be possible and at some time or other it will take place; but the methods by which we organize the work of psychoanalysis do not favor our beginning with just this task. We can foresee the time when this task will claim the attention of psychoanalysis. There are forms of neuroses, the so-called narcistic neuroses, in which the ego is far more deeply involved than in anything we have studied heretofore. The analytic investigation of these conditions will enable us to judge reliably and impartially the part that the ego plays in neurotic illness.

One of the relations which the ego bears to its neurosis is so obvious that it must be considered at the very outset. In no case does it seem to be absent, and it is most clearly recognizable in the traumatic neuroses, conditions which we do not as yet clearly understand. You must know that

in the causation and mechanisms of all possible forms of neurosis, the same factors are active again and again; it is only the emphasis that is shifted from one to the other of these factors in symptom formation. The members of a company of actors each have certain parts to play — hero, villain, confidant, etc. — yet each will select a different drama for his benefit. Thus the phantasies which undergo conversion into symptoms are especially easy to detect in hysteria; compulsion neuroses are essentially dominated by the reactionary formations, or counter-seizures of the ego; what we designate as *secondary elaboration* in dreams dominates paranoia in the form of delusions, etc.

In traumatic neuroses, particularly if they are caused by the horrors of war, we are especially impressed by a selfish ego-impulse which seeks protection and personal advantage. This in itself is not a sufficient cause for illness, but it can favor its beginning and also feed its needs once it has been established. This motive serves to protect the ego from the dangers whose imminence precipitated the disease, and does not permit convalescence until the recurrence of these dangers seems impossible, or until compensation has been obtained for the danger that has been undergone.

But the ego betrays similar interest in the origin and maintenance of all other neuroses. We have already said that the ego suffers the symptom to exist, because one of its phases gratifies the egoistic tendency toward suppression. Besides, the ending of the conflict by means of symptom development is the path of least resistance, and a most convenient solution for the principle of pleasure. Through symptom formation the ego is undoubtedly spared a severe and unpleasant inner task. There are cases where even the physician must admit that the resolution of the conflict into neurosis is the most harmless outcome and one most easily tolerated by society. Do not be surprised, then, to learn that occasionally even the physician takes the part of the illness he is battling against. He does not have to restrict himself to the role of the fanatic warrior for health in all situations of life. He knows that the world contains not only neurotic misery, but also real, incurable suffering. He knows that necessity may even require a human being to sacrifice his health, and he learns that by this sacrifice on the part of one individual untold wretchedness may be spared for many others. So if we say that the neurotic escapes the conflict *by taking refuge in illness*, we must admit that in some cases this escape is

justifiable, and the physician who has diagnosed the state of affairs will retire silently and tactfully.

But let us not consider these special cases in our further discussion. In average cases the ego, by having recourse to neurosis, obtains a certain inner *advantage from the disease*. Under certain conditions of life, there may also be derived a tangible external advantage, more or less valuable in reality. Let me direct your attention to the most frequent occurrences of this sort. Women who are brutally treated and mercilessly exploited by their husbands almost always adopt the evasion of the neurosis, provided that their predisposition permits this. This usually follows when the woman is too cowardly or too virtuous to seek secret solace in the arms of another, or when she dare not separate from her husband in the face of all opposition, when she has no prospect of maintaining herself or of finding a better husband and especially when her sexual emotions still bind her to this brutal man. Her illness becomes a weapon in her struggle with him, one that she can use for self-protection and misuse for purposes of vengeance. She probably dare not complain of her marriage, but she can complain of her illness. The doctor becomes her assistant. She forces her inconsiderate husband to spare her, to attend to her wishes, to permit her absence from the house and thus free her from the oppressions of her married life. Wherever such external or accidental gain through illness is considerable and can find no substitute in fact, you can prophesy that the possibility of influencing neurosis through therapy is very slight.

You will tell me that what I have said about the advantage gained from the disease speaks entirely for the hypothesis I have rejected, namely, that the ego itself wills and creates the neurosis. Just a moment! It probably does not mean more than that the ego passively suffers the neurosis to exist, which it is unable to prevent anyway. It makes the most of the neurosis, if anything can be made of it at all. This is only one side of the question, the advantageous side. The ego is willing to endure the advantages of the neurosis, but there are not only advantages. As a rule it soon appears that the ego has made a poor deal in accepting the neurosis. It has paid too high a price for the mitigation of the conflict; and the sensations of suffering which the symptoms bring with them are perhaps every bit as bad as the agonies of conflict, usually they cause even greater discomfort. The ego wants to rid itself of the pain of the symptoms without relinquishing the gain of illness, and that is impossible. Thus the

ego is discovered as by no means so active as it had thought itself to be, and this we want to keep in mind.

If you were to come into contact with neurotics as a physician, you would soon cease to expect that those who complain most woefully of their illness are the ones who will oppose its therapy with the least resistance or who will welcome any help. On the contrary, you would readily understand that everything contributing to the advantage derived from the disease will strengthen the resistance to the suppression and heighten the difficulty of the therapy. We must also add another and later advantage to the gain of illness which is born with the symptom. If a psychic organization, such as this illness, has persisted for a long time, it finally behaves as an independent unit, it expresses something like self-preservation, attains a kind of *modus vivendi* between itself and other parts of psychic life, even those that are fundamentally hostile to it. And occasions will probably arise where it can prove again to be both useful and valuable, by which it will attain a *secondary function*, which gives strength to its existence. Instead of an illustration from pathology take a striking example from everyday life. An efficient workman who earns his living is crippled for his occupation by some disaster; his work is over for him. After a while, however, he receives a small accident insurance, and learns to exploit his injury by begging. His new existence, though most undesirable, is based upon the very thing that robbed him of his former maintenance. If you could cure his defect, he would be without a means of subsistence, he would have no livelihood. The question would arise: Is he capable of resuming his former work? That which corresponds to such secondary exploitation of illness in neurosis we may add to the primary benefit derived therefrom and may term it a *secondary* advantage of disease.

In general I should like to warn you not to underestimate the practical significance of the advantage from illness and yet not to be too much impressed by it theoretically. Aside from the previously recognized exceptions, I am always reminded of Oberländer's pictures on "the intelligence of animals" which appeared in the *Fliegende Blätter*. An Arab is riding a camel on a narrow path cut through a steep mountain side. At a turn of the trail he is suddenly confronted by a lion who makes ready to spring. He sees no way out, on one side the precipice, on the other the abyss; retreat and flight — both are impossible; he gives himself up as

lost. Not so the camel. He leaps into the abyss with his rider — and the lion is left in the lurch. The help of neurosis is as a rule no kinder to the rider. It may be due to the fact that the settlement of the conflict through symptom development is nevertheless an automatic process, not able to meet the demands of life, and for whose sake man renounces the use of his best and loftiest powers. If it were possible to choose, it were indeed best to perish in an honorable struggle with destiny.

I still owe you further explanation as to why, in my presentation of the theory of neurosis, I did not proceed from ordinary nervousness as a starting point. You may assume that, had I done this, the proof of the sexual origin of neurosis would have been more difficult for me, and so I refrained. There you are mistaken. In transference neurosis we must work at interpretations of the symptoms to arrive at this conclusion. In the ordinary forms of the so-called true neuroses, however, the etiological significance of sexual life is a crude fact open to observation. I discovered it twenty years ago when I asked myself one day why we regularly barred out questions concerning sexual activity in examining nervous patients. At that time I sacrificed my popularity among my patients to my investigations, yet after a brief effort I could state that no neurosis, no true neurosis at least, is present with a normal sexual life. Of course, this statement passes too lightly over the individual differences, it is unclear through the vagueness with which it uses the term “normal,” but even to-day it retains its value for purposes of rough orientation. At that time I reached the point of drawing comparisons between certain forms of nervousness and sexual abnormalities, and I do not doubt that I could repeat the same observations now, if similar material were at my disposal. I frequently noticed that a man who contented himself with incomplete sexual gratification, with manual ononism, for instance, would suffer from a true neurosis, and that this neurosis would promptly give way to another form, if another sexual regime no less harmful were substituted. From the change in the condition of the patient I was able to guess the change in the mode of his sexual life. At that time I learned to hold obstinately to my conjectures until I had overcome the patient’s prevarications and had forced him to confirm my suppositions. To be sure, then he preferred to consult other physicians who did not inquire so insistently into his sexual life.

At that time it did not escape my notice that the origin of the disease could not always be traced back to sexual life; sexual abnormality would cause the illness in one person, while another would fall ill because he had lost his fortune or had suffered an exhausting organic disease. We gained insight into this variation by means of the interrelations between the ego and the libido, and the more profound our insight became, the more satisfactory were the results. A person begins to suffer from neurosis when his ego has lost the capacity of accommodating the libido. The stronger the ego, the easier the solution of the problem; a weakening of the ego from any cause whatsoever has the same effect as a superlative increase of the claims of the libido. There are other and more intimate relations between the ego and the libido which I shall not discuss, as we are not concerned with them here. To us it is of enlightening significance that in every case, regardless of the way in which the illness was caused, the symptoms of neurosis were opposed by the libido and thus gave evidence for its abnormal use.

Now, however, I want to draw your attention to the difference between the symptoms of the true neuroses and the psychoneuroses, the first group of which, the transference neurosis, has occupied us considerably. In both cases the symptoms proceed from the libido. They are accordingly abnormal uses of it, substitutes for gratification. But the symptoms of the true neurosis — such as pressure in the head, sensations of pain, irritability of an organ, weakening or inhibition of a function — these have no meaning, no psychic significance. They are manifested not only in the body, as for instance hysteric symptoms, but are in themselves physical processes whose creation is devoid of all the complicated psychic mechanism with which we have become acquainted. They really embody the character that has so long been attributed to the psychoneurotic symptom. But how can they then correspond to uses of the libido, which we have come to know as a psychological force? That is quite simple. Let me recall one of the very first objections that was made to psychoanalysis. It was stated that psychoanalysis was concerned with a purely psychological theory of neurotic manifestations; that this was a hopeless outlook since psychological theories could never explain illness. The objectors chose to forget that the sexual function is neither purely psychic nor merely somatic. It influences physical as well as psychic life. In the symptoms of the psychoneuroses we have recognized the expression of a

disturbance in psychic processes. And so we shall not be surprised to discover that the true neuroses are the direct somatic consequences of sexual disturbances.

The medical clinic gives us a valuable suggestion (observed by many research workers) for the comprehension of the true neuroses. In all the details of their symptomatology, and as well in their characteristic power to influence all organic systems and all functions, the true neuroses reveal a marked similarity to the conditions of those diseases which originate through the chronic influence of foreign poisons and as well through their acute diminution; with conditions prevalent in intoxication and abstinence. The two groups of conditions are brought still closer together by the relation of intermediate conditions, which, following M. Basedowi, we have learned to attribute to the influence of toxic substances, but of toxins, however, which are not introduced into the body from without, but arise in its own metabolism. These analogies, I think, lead us directly to the consideration of these neuroses as disturbances in sexual metabolism. It may be that more sexual toxins are produced than the individual can dispose of, or that inner, even psychic conditions, stand in the way of the proper elaboration of these substances. The language of the people has always favored such assumptions as to the nature of sexual desires. It calls love an “intoxication”; it will have love-madness aroused through potions, and thus sees the motive force removed, as it were, to the outer world. For the rest, the phrase “sexual metabolism” or “chemism of sexuality” is a chapter-head without content. We know nothing about it and cannot even decide whether we are to assume two sexual substances, the male and the female, or, if there is only *one* sexual toxin, which to consider the carrier of all the stimulating power of the libido. The structure of psychoanalysis that we have erected is really only a superstructure which at some future time must be placed upon its organic foundation; but what this is we do not know as yet.

Psychoanalysis is characterized as a science, not by reason of the subject matter it handles but by the technique it employs. This can be employed in dealing with the history of civilization, the science of religion or mythology, as well as with the theory of neurosis, without altering its character. The revealing of the unconscious in psychic life is all it aims to accomplish. The problems of the true neuroses, whose symptoms probably originate in direct toxic damage, yield no point of attack to

psychoanalysis. Psychoanalysis can do little for their elucidation, and must leave the task to biological-medical research. Perhaps you understand now why I did not choose to organize my material differently. If I had given to you an *Introduction to the Theory of the Neuroses* as you wished, it would unquestionably have been correct to proceed from the simple forms of the true neuroses to those complex illnesses caused by a disturbance of the libido. In discussing the true neuroses I would have had to bring together the facts we have gleaned from various quarters and present what we think we know of them. Only later, under the psychoneuroses, would psychoanalysis have been discussed as the most important technical aid for insight into these conditions. I had, however, intended and announced *A General Introduction to Psychoanalysis*, and it seemed to me more important to give you an idea of psychoanalysis than to present certain positive facts about neuroses; and so I could not place the true neuroses into the foreground, for they prove sterile for the purposes of psychoanalysis. I believe that I have made the wiser choice for you, since psychoanalysis deserves the interest of every educated person because of its profound hypotheses and far-reaching connections. The theory of neurosis, on the other hand, is a chapter of medicine like any other.

You are, however, justified in expecting some interest on our part in the true neuroses. Because of their intimate connection with psychoneuroses we find this decidedly necessary. I shall tell you then that we distinguish three pure forms of true neuroses: *neurasthenia*, *anxiety neurosis* and *hypochondria*. Even this classification has not remained uncontradicted. The terms are all widely used, but their connotation is vague and uncertain. Besides, there are in this world of confusion physicians who object to any distinctions between manifestations, any emphasis of clinical detail, who do not even recognize the separation of true neuroses and psychoneuroses. I think they have gone too far and have not chosen the road which leads to progress. The types of neuroses we have mentioned occur occasionally in pure form; more often they are blended with one another or with a psychoneurotic condition. This need not discourage us to the extent of abandoning the task of distinction. Think of the difference between the study of minerals and that of ores in mineralogy. Minerals are described as individuals; frequently of course they occur as crystals, separated sharply from their surroundings. Ores consist of an aggregate of

minerals which have coalesced not accidentally, but as a result of the conditions of their origin. We understand too little of the process of development of neuroses, to create anything similar to the study of ores. But we are surely working in the right direction when we isolate the known clinical factors, comparable to the separate minerals, from the great mass.

A noteworthy connection between the symptoms of the true neuroses and the psychoneuroses adds a valuable contribution to our knowledge of symptom formation in the latter. The symptom in the true neuroses is frequently the nucleus and incipient stage of development of the psychoneurotic symptom. Such a connection is most easily observed between neurasthenia and the transference neuroses, which are termed conversion hysteria, between anxiety neurosis and anxiety hysteria, but also between hypochondria and paraphrenia (dementia praecox and paranoia), forms of neuroses of which we shall speak subsequently. Let us take as an illustration the hysteric headache or backache. Analysis shows that through elaboration and displacement this pain has become the gratification substitute for a whole series of libidinous phantasies or reminiscences. But once upon a time this pain was real, a direct sexual toxic symptom, the physical expression of libidinous excitation. We do not wish to assert, by any means, that all hysteric symptoms can be traced to such a nucleus, but it is true that this is frequently the case, and that all influences upon the body through libidinous excitation, whether normal or pathological, are especially significant for the symptom development in hysteria. They play the part of the grain of sand which the mollusc has enveloped in mother-of-pearl. In the same way passing signs of sexual excitation, which accompany the sexual act, are used by psychoneurosis as the most convenient and appropriate material for symptom formation.

A similar procedure is of diagnostic and therapeutic interest especially. Persons who are disposed to be neurotic, without suffering from a flourishing neurosis, frequently set in motion the work of symptom development as the result of an abnormal physical change — often an inflammation or an injury. This development rapidly makes the symptom given by reality the representative of the unconscious phantasies that had been lurking for an opportunity to seize upon a means of expression. In such a case the physician will try different ways of therapy. Either he will try to do away with the organic basis without bothering about its noisy

neurotic elaboration, or he will struggle with the neurosis brought out by the occasion, and ignore its organic cause. The result will justify now one, now the other method of procedure; no general laws can be laid down for such mixed cases.

TWENTY-FIFTH LECTURE. GENERAL THEORY OF THE NEUROSES

Fear and Anxiety

PROBABLY you will term what I told you about ordinary nervousness in my last lecture most fragmentary and unsatisfactory information. I know this, and I think you were probably most surprised that I did not mention fear, which most nervous people complain of and describe as their greatest source of suffering. It can attain a terrible intensity which may result in the wildest enterprises. But I do not wish to fall short of your expectations in this matter. I intend, on the contrary, to treat the problem of the fear of nervous people with great accuracy and to discuss it with you at some length.

Fear itself needs no introduction; everyone has at some time or other known this sensation or, more precisely, this effect. It seems to me that we never seriously inquired why the nervous suffered so much more and so much more intensely under this condition. Perhaps it was thought a matter of course; it is usual to confuse the words “nervous” and “anxious” as though they meant the same thing. That is unjustifiable; there are anxious people who are not nervous, and nervous people who suffer from many symptoms, but not from the tendency to anxiety.

However that may be, it is certain that the problem of fear is the meeting point of many important questions, an enigma whose complete solution would cast a flood of light upon psychic life. I do not claim that I can furnish you with this complete solution, but you will certainly expect psychoanalysis to deal with this theme in a manner different from that of the schools of medicine. These schools seem to be interested primarily in the anatomical cause of the condition of fear. They say the medulla oblongata is irritated, and the patient learns that he is suffering from neurosis of the nervus vague. The medulla oblongata is a very serious and beautiful object. I remember exactly how much time and trouble I devoted to the study of it, years ago. But today I must say that I know of nothing more indifferent to me for the psychological comprehension of fear, than knowledge of the nerve passage through which these sensations must pass.

One can talk about fear for a long time without even touching upon nervousness. You will understand me without more ado, when I term this

fear *real* fear in contrast to *neurotic* fear. Real fear seems quite rational and comprehensible to us. We may testify that it is a reaction to the perception of external danger, viz., harm that is expected and foreseen. It is related to the flight reflex and may be regarded as an expression of the instinct of self-preservation. And so the occasions, viz., the objects and situations which arouse fear, will depend largely on our knowledge of and our feeling of power over the outer world. We deem it quite a matter of course that the savage fears a cannon or an eclipse of the sun, while the white man, who can handle the instrument and prophesy the phenomenon, does not fear these things. At other times superior knowledge promulgates fear, because it recognizes the danger earlier. The savage, for instance, will recoil before a footprint in the woods, meaningless to the uninstructed, which reveals to him the proximity of an animal of prey; the experienced sailor will notice a little cloud, which tells him of a coming hurricane, with terror, while to the passenger it seems insignificant.

After further consideration, we must say to ourselves that the verdict on real fear, whether it be rational or purposeful, must be thoroughly revised. For the only purposeful behavior in the face of imminent danger would be the cool appraisal of one's own strength in comparison with the extent of the threatening danger, and then decide which would presage a happier ending: flight, defense, or possibly even attack. Under such a proceeding fear has absolutely no place; everything that happens would be consummated just as well and better without the development of fear. You know that if fear is too strong, it proves absolutely useless and paralyzes every action, even flight. Generally the reaction against danger consists in a mixture of fear and resistance. The frightened animal is afraid and flees. But the purposeful factor in such a case is not fear but flight.

We are therefore tempted to claim that the development of fear is never purposeful. Perhaps closer examination will give us greater insight into the fear situation. The first factor is the expectancy of danger which expresses itself in heightened sensory attention and in motor tension. This expectancy is undoubtedly advantageous; its absence may be responsible for serious consequences. On the one hand, it gives rise to motor activity, primarily to flight, and on a higher plane to active defense; on the other hand, it gives rise to something which we consider the condition of fear. In so far as the development is still incipient, and is restricted to a mere signal, the more undisturbed the conversion of the readiness to be afraid

into action the more purposeful the entire proceeding. The readiness to be afraid seems to be the purposeful aspect; evolution of fear itself, the element that defeats its own object.

I avoid entering upon a discussion as to whether our language means the same or distinct things by the words anxiety, fear or fright. I think that anxiety is used in connection with a condition regardless of any objective, while fear is essentially directed toward an object. Fright, on the other hand, seems really to possess a special meaning, which emphasizes the effects of a danger which is precipitated without any expectance or readiness of fear. Thus we might say that anxiety protects man from fright.

You have probably noticed the ambiguity and vagueness in the use of the word “anxiety.” Generally one means a subjective condition, caused by the perception that an “evolution of fear” has been consummated. Such a condition may be called an emotion. What is an emotion in the dynamic sense? Certainly something very complex. An emotion, in the first place, includes indefinite motor innervations or discharges; secondly, definite sensations which moreover are of two kinds, the perception of motor activities that have already taken place, and the direct sensations of pleasure and pain, which give the effect of what we call its feeling tone. But I do not think that the true nature of the emotion has been fathomed by these enumerations. We have gained deeper insight into some emotions and realize that the thread which binds together such a complex as we have described is the repetition of a certain significant experience. This experience might be an early impression of a very general sort, which belongs to the antecedent history of the species rather than to that of the individual. To be more clear: the emotional condition has a structure similar to that of an hysterical attack; it is the upshot of a reminiscence. The hysteric attack, then, is comparable to a newly formed individual emotion, the normal emotion to an hysteria which has become a universal heritage.

Do not assume that what I have said here about emotions is derived from normal psychology. On the contrary, these are conceptions that have grown up with and are at home only in psychoanalysis. What psychology has to say about emotions — the James-Lange theory, for instance — is absolutely incomprehensible for us psychoanalysts, and cannot be discussed. Of course, we do not consider our knowledge about emotions very certain; it is a preliminary attempt to become oriented in this obscure

region. To continue: We believe we know the early impression which the emotion of fear repeats. We think it is birth itself which combines that complex of painful feelings, of a discharge of impulses, of physical sensations, which has become the prototype for the effect of danger to life, and is ever after repeated within us as a condition of fear. The tremendous heightening of irritability through the interruption of the circulation (internal respiration) was at the time the cause of the experience of fear; the first fear was therefore toxic. The name anxiety — angustial — narrowness, emphasizes the characteristic tightening of the breath, which was at the time a consequence of an actual situation and is henceforth repeated almost regularly in the emotion. We shall also recognize how significant it is that this first condition of fear appeared during the separation from the mother. Of course, we are convinced that the tendency to repetition of the first condition of fear has been so deeply ingrained in the organism through countless generations, that not a single individual can escape the emotion of fear; not even the mythical Macduff who was "cut out of his mother's womb," and therefore did not experience birth itself. We do not know the prototype of the condition of fear in the case of other mammals, and so we do not know the complex of emotions that in them is the equivalent of our fear.

Perhaps it will interest you to hear how the idea that birth is the source and prototype of the emotion of fear, happened to occur to me. Speculation plays the smallest part in it; I borrowed it from the native train of thought of the people. Many years ago we were sitting around the dinner table — a number of young physicians — when an assistant in the obstetrical clinic told a jolly story of what had happened in the last examination for midwives. A candidate was asked what it implied if during delivery the foeces of the newborn was present in the discharge of waters, and she answered promptly "the child is afraid." She was laughed at and "flunked." But I silently took her part and began to suspect that the poor woman of the people had, with sound perception, revealed an important connection.

Proceeding now to neurotic fear, what are its manifestations and conditions? There is much to be described. In the first place we find a general condition of anxiety, a condition of free-floating fear as it were, which is ready to attach itself to any appropriate idea, to influence judgment, to give rise to expectations, in fact to seize any opportunity to

make itself felt. We call this condition “expectant fear” or “anxious expectation.” Persons who suffer from this sort of fear always prophesy the most terrible of all possibilities, interpret every coincidence as an evil omen, and ascribe a dreadful meaning to all uncertainty. Many persons who cannot be termed ill show this tendency to anticipate disaster. We blame them for being over-anxious or pessimistic. A striking amount of expectant fear is characteristic of a nervous condition which I have named “anxiety neurosis,” and which I group with the true neuroses.

A second form of fear in contrast to the one we have just described is psychologically more circumscribed and bound up with certain objects or situations. It is the fear of the manifold and frequently very peculiar phobias. Stanley Hall, the distinguished American psychologist, has recently taken the trouble to present a whole series of these phobias in gorgeous Greek terminology. They sound like the enumeration of the ten Egyptian plagues, except that their number exceeds ten, by far. Just listen to all the things which may become the objects of contents of a phobia: Darkness, open air, open squares, cats, spiders, caterpillars, snakes, mice, thunder-storms, sharp points, blood, enclosed spaces, crowds, solitude, passing over a bridge, travel on land and sea, etc. A first attempt at orientation in this chaos leads readily to a division into three groups. Some of the fearful objects and situations have something gruesome for normal people too, a relation to danger, and so, though they are exaggerated in intensity, they do not seem incomprehensible to us. Most of us, for instance, experience a feeling of repulsion in the presence of a snake. One may say that snakephobia is common to all human beings, and Charles Darwin has described most impressively how he was unable to control his fear of a snake pointing for him, though he knew he was separated from it by a thick pane of glass. The second group consists of cases which still bear a relation to danger, but this is of a kind which we are disposed to belittle rather than to overestimate. Most of the situation-phobia belong here. We know that by taking a railroad journey we entail greater chance of disaster than by staying at home. A collision, for instance, may occur, or a ship sink, when as a rule we must drown; yet we do not think of these dangers, and free from fear we travel on train and boat. We cannot deny that if a bridge should collapse at the moment we are crossing it, we would fall into the river, but that is such a rare occurrence that we do not take the danger into account. Solitude too has its dangers and we avoid it under

certain conditions; but it is by no means a matter of being unable to suffer it for a single moment. The same is true for the crowd, the enclosed space, the thunder-storm, etc. It is not at all the content but the intensity of these neurotic phobias that appears strange to us. The fear of the phobia cannot even be described. Sometimes we almost receive the impression that the neurotic is not really afraid of the same things and situations that can arouse fear in us, and which he calls by the same name.

There remains a third group of phobias which is entirely unintelligible to us. When a strong, adult man is afraid to cross a street or a square of his own home town, when a healthy, well-developed woman becomes almost senseless with fear because a cat has brushed the hem of her dress or a mouse has scurried through the room — how are we to establish the relation to danger that obviously exists under the phobia? In these animal phobias it cannot possibly be a question of the heightening of common human antipathies. For, as an illustration of the antithesis, there are numerous persons who cannot pass a cat without calling and petting it. The mouse of which women are so much afraid, is at the same time a first class pet name. Many a girl who has been gratified to have her lover call her so, screams when she sees the cunning little creature itself. The behavior of the man who is afraid to cross the street or the square can only be explained by saying that he acts like a little child. A child is really taught to avoid a situation of this sort as dangerous, and our agoraphobist is actually relieved of his fear if some one goes with him across the square or street.

The two forms of fear that have been described, free-floating fear and the fear which is bound up with phobias, are independent of one another. The one is by no means a higher development of the other; only in exceptional cases, almost by accident, do they occur simultaneously. The strongest condition of general anxiety need not manifest itself in phobias; and persons whose entire life is hemmed in by agoraphobia can be entirely free of pessimistic expectant fear. Some phobias, such as the fear of squares or of trains, are acquired only in later life, while others, the fear of darkness, storms and animals, exist from the very beginning. The former signify serious illness, the latter appear rather as peculiarities, moods. Yet whoever is burdened with fear of this second kind may be expected to harbor other and similar phobias. I must add that we group all these

phobias under *anxiety hysteria*, and therefore regard it as a condition closely related to the well-known conversion hysteria.

The third form of neurotic fear confronts us with an enigma; we loose sight entirely of the connection between fear and threatening danger. This anxiety occurs in hysteria, for instance, as the accompaniment of hysteric symptoms, or under certain conditions of excitement, where we would expect an emotional manifestation, but least of all of fear, or without reference to any known circumstance, unintelligible to us and to the patient. Neither far nor near can we discover a danger or a cause which might have been exaggerated to such significance. Through these spontaneous attacks we learn that the complex which we call the condition of anxiety can be resolved into its components. The whole attack may be represented by a single intensively developed symptom, such as a trembling, dizziness, palpitation of the heart, or tightening of breath; the general undertone by which we usually recognize fear may be utterly lacking or vague. And yet these conditions, which we describe as "anxiety equivalents," are comparable to anxiety in all its clinical and etiological relations.

Two questions arise. Can we relate neurotic fear, in which danger plays so small a part or none at all, to real fear, which is always a reaction to danger? And what can we understand as the basis of neurotic fear? For the present we want to hold to our expectations: "Wherever there is fear, there must be a cause for it."

Clinical observation yields several suggestions for the comprehension of neurotic fear, the significance of which I shall discuss with you.

1. It is not difficult to determine that expectant fear or general anxiety is closely connected with certain processes in sexual life, let us say with certain types of libido. Utilization, the simplest and most instructive case of this kind, results when persons expose themselves to frustrated excitation, viz., if their sexual excitation does not meet with sufficient relief and is not brought to a satisfactory conclusion, in men, during the time of their engagement to marry, for instance, or in women whose husbands are not sufficiently potent or who, from caution, execute the sexual act in a shortened or mutilated form. Under these circumstances libidinous excitement disappears and anxiety takes its place, both in the form of expectant fear and in attacks and anxiety equivalents. The cautious interruption of the sexual act, when practiced as the customary sexual

regime, so frequently causes the anxiety neurosis in men, and especially in women, that physicians are wise in such cases to examine primarily this etiology. On innumerable occasions we have learned that anxiety neurosis vanishes when the sexual misuse is abandoned.

So far as I know, the connection between sexual restraint and conditions of anxiety is no longer questioned even by physicians who have nothing to do with psychoanalysis. But I can well imagine that they do not desist from reversing the connection and saying that these persons have exhibited a tendency to anxiety from the outset and therefore practice reserve in sexual matters. The behavior of women whose sexual conduct is passive, viz., is determined by the treatment of the husband, contradicts this supposition. The more temperamental, that is, the more disposed toward sexual intercourse and capable of gratification is the woman, the more will she react to the impotence of the man, or to the *coitus interruptus*, by anxiety manifestations. In anaesthetic or only slightly libidinous women, such misuse will not carry such consequences.

Sexual abstinence, recommended so warmly by the physicians of to-day, has the same significance in the development of conditions of anxiety only when the libido, to which satisfactory relief is denied, is sufficiently strong and not for the most part accounted for by sublimation. The decision whether illness is to result always depends upon the quantitative factors. Even where character formation and not disease is concerned, we easily recognize that sexual constraint goes hand in hand with a certain anxiety, a certain caution, while fearlessness and bold daring arise from free gratification of sexual desires. However much these relations are altered by various influences of civilization, for the average human being it is true that anxiety and sexual constraint belong together.

I have by no means mentioned all the observations that speak for the genetic relation of the libido to fear. The influence on the development of neurotic fear of certain phases of life, such as puberty and the period of menopause, when the production of libido is materially heightened, belongs here too. In some conditions of excitement we may observe the mixture of anxiety and libido and the final substitution of anxiety for libido. These facts give us a twofold impression, first that we are concerned with an accumulation of libido, which is diverted from its normal channel, second that we are working with somatic processes. Just how anxiety originates from the libido we do not know; we can only

ascertain that the libido is in abeyance, and that we observe anxiety in its place.

2. We glean a second hint from the analysis of the psychoneuroses, especially of hysteria. We have heard that in addition to the symptoms, fear frequently accompanies this condition; this, however, is free floating fear, which is manifested either as an attack or becomes a permanent condition. The patients cannot tell what they are afraid of and connect their fear, through an unmistakable secondary elaboration, with phobias nearest at hand; death, insanity, paralysis. When we analyze the situation which gave rise to the anxiety or to symptoms accompanied by it, we can generally tell which normal psychologic process has been omitted and has been replaced by the phenomenon of fear. Let me express it differently: we reconstruct the unconscious process as though it had not experienced suppression and had continued its way into consciousness uninterruptedly. Under these conditions as well this process would have been accompanied by an emotion, and we now learn with surprise that when suppression has occurred the emotion accompanying the normal process has been replaced by fear, regardless of its original quality. In hysteric conditions of fear, its unconscious correlative may be either an impulse of similar character, such as fear, shame, embarrassment or positive libidinous excitation, or hostile and aggressive emotion such as fury or rage. Fear then is the common currency for which all emotional impulses can be exchanged, provided that the idea with which it has been associated has been subject to suppression.

3. Patients suffering from compulsive acts are remarkably devoid of fear. They yield us the data for our third point. If we try to hinder them in the performance of their compulsive acts, of their washing or their ceremonials, or if they themselves dare to give up one of their compulsions, they are seized with terrible fear that again exacts obedience to the compulsion. We understand that the compulsive act had veiled fear and had been performed only to avoid it. In compulsion neurosis then, fear, which would otherwise be present, is replaced by symptom development. Similar results are yielded by hysteria. Following the process of suppression we find the development, either of anxiety alone or of anxiety and symptom development, or finally a more complete symptom development and no anxiety. In an abstract sense, then, it would be correct to say that symptoms are formed only to evade development of

fear, which otherwise could not be escaped. According to this conception, fear is seen to occupy the center of the stage in the problems of neurosis.

Our observations on anxiety neuroses led to the conclusion that when the libido was diverted from its normal use and anxiety thus released, it occurred on the basis of somatic processes. The analyses of hysteria and compulsion neuroses furnish the correlative observations that similar diversion with similar results may also be the consequence of a constraint of psychic forces. Such then is our knowledge of the origin of neurotic fear; it still sounds rather vague. But as yet I know no path that would lead us further. The second task we have set ourselves is still more difficult to accomplish. It is the establishment of a connection between neurotic fear, which is misused libido, and real fear, which is a reaction to danger. You may believe that these things are quite distinct and yet we have no criterion for distinguishing the sensations of real and neurotic fear.

The desired connection is brought about by presupposing the antithesis of the ego to libido that is so frequently claimed. We know that the development of fear is the ego's reaction to danger, the signal for preparation for flight, and from this we are led to believe that in neurotic fear the ego attempts to escape the claims of its libido, and treats this inner danger as though it came from without. Accordingly our expectation that where there is fear there must be something to be afraid of, is fulfilled. But the analogy admits of further application. Just as the attempt to flee external danger is relieved by standing one's ground, and by appropriate steps toward defense, so the development of neurotic fear is arrested as fast as the symptom develops, for by means of it the fear is held in check.

Our difficulties in understanding now lie elsewhere. The fear, which represents flight of the ego before the libido, is supposed to have sprung from the libido itself. That is obscure and warns us not to forget that the libido of a person belongs fundamentally to him and cannot confront him as an external force. The localized dynamics of fear development are still unintelligible; we do not know what psychic energies are released or from what psychic systems they are derived. I cannot promise to solve this problem, but we still have two trails to follow which lead us to direct observations and analytic investigation which can aid our speculations. We turn to the origin of fear in the child, and to the source of neurotic fear which attaches itself to phobias.

Fear in children is quite common and it is very hard to tell whether it is neurotic or real fear. Indeed, the value of this distinction is rendered questionable by the behavior of children. On the one hand we are not surprised that the child fears all strange persons, new situations and objects, and we explain this reaction very easily by his weakness and ignorance. We ascribe to the child a strong disposition to real fear and would consider it purposeful if this fear were in fact a heritage. Herein the child would only repeat the behavior of prehistoric man and of the primitive man of today who, on account of his ignorance and helplessness, fears everything that is new, and much that is familiar, all of which can no longer inspire us with fear. If the phobias of the child were at least partially such as might be attributed to that primeval period of human development, this would tally entirely with our expectations.

On the other hand, we cannot overlook the fact that not all children are equally afraid, and that those very children who express particular timidity toward all possible objects and situations subsequently prove to be nervous. Thus the neurotic disposition reveals itself by a decided tendency to real fear; anxiety rather than nervousness appears to be primary. We therefore arrive at the conclusion that the child (and later the adult) fears the power of his libido because he is anxious in the face of everything. The derivation of anxiety from the libido is hence put aside. Any investigation of the conditions of real fear consistently leads to the conclusion that consciousness of one's own weakness and helplessness — inferiority, in the terminology of A. Adler — when it is able to persist from childhood to maturity, is the cause underlying the neuroses.

This sounds so simple and convincing that it has a claim upon our attention. To be sure, it would result in our shifting the basis of nervousness. The persistence of the feeling of inferiority, and its prerequisite condition of anxiety and its subsequent development of symptoms, is so firmly established that it is rather the exceptional case, when health is the outcome, which requires an explanation. What can be learned from careful observation of the fear of children? The little child is primarily afraid of strange people; situations wax important only because they involve people, and objects become influential much later. But the child does not fear these strange persons because he attributes evil intentions to them, because he compares his weakness with their strength or recognizes them as dangerous to his existence, his safety and freedom

from pain. Such a child, suspicious, afraid of the aggressive impulse which dominates the world, would prove a sad theoretic construction. The child is afraid of a stranger because he is adjusted to a dear, beloved person, his mother. His disappointment and longing are transformed into fear, his unemployed libido, which cannot yet be held suspended, is diverted by fear. It cannot be termed a coincidence that this situation, which is a typical example of all childish fear, is a repetition of the first condition of fear during birth, viz., separation from the mother.

The first situation phobias of children are darkness and solitude; the former often persists throughout life; common to both is the absence of the dear nurse, the mother. I once heard a child, who was afraid of the dark, call into an adjoining room, “Auntie, talk to me, I am afraid.” “But what good will that do you? You cannot see me!” Whereupon the child answered, “If someone speaks, it is brighter.” The yearning felt in darkness is converted into the fear of darkness. Far from saying that neurotic fear is only a secondary, a special case of real fear, we observe in little children something that resembles the behavior of real fear and has in common with neurotic fear, this characteristic feature: origin from unemployed libido. The child seems to bring very little real fear into the world. In all situations which may later become the conditions of phobias, on elevations, narrow bridges across water, on railroad and boat trips, the child exhibits no fear. And the more ignorant he is, the less fear he feels. It would be most desirable to have a greater heritage of such life-preservative instincts; the task of supervision, which is to hinder him from exposing himself to one danger after another, would be lessened. In reality the child at first overestimates his powers and behaves fearlessly because he does not recognize dangers. He will run to the water’s edge, mount the window sill, play with fire or with sharp utensils, in short, he will do everything that would harm him and alarm his guardians. The awakening of real fear is the result of education, since we may not permit him to pass through the instructive experience himself.

If there are children who meet this education to fear half way, and who discover dangers of which they have not been warned, the explanation suffices that their constitution contains a greater measure of libidinous need or that they have been spoiled early through libidinous gratification. No wonder that those persons who are nervous in later life are recruited from the ranks of these children. We know that the creation of neurosis is

made easy by the inability to endure a considerable amount of pent-up libido for any length of time. You see that here too we must do justice to the constitutional factor, whose rights we never wish to question. We fight shy of it only when others neglect all other claims for this, and introduce the constitutional factor where it does not belong according to the combined results of observation and analysis, or where it must be the last consideration.

Let us extract the sum of our observations on the anxiety of children: Infantile fear has very little to do with real fear, but is closely related to the neurotic fear of adults. It originates in unemployed libido and replaces the object of love that is lacking by an external object or situation.

Now you will be glad to hear that the analysis of phobias cannot teach much more that is new. The same thing occurs in them as in the fear of children; unemployed libido is constantly being converted into real fear and so a tiny external danger takes the place of the demands of the libido. This coincidence is not strange, for infantile phobias are not only the prototypes but the direct prerequisite and prelude to later phobias, which are grouped with the anxiety hysterias. Every hysteria phobia can be traced to childish fear of which it is a continuation, even if it has another content and must therefore receive a different name. The difference between the two conditions lies in their mechanism. In the adult the fact that the libido has momentarily become useless in the form of longing, is not sufficient to effect the transformation of fear into libido. He has long since learned to maintain such libido in a suspended state or to use it differently. But when the libido is part of a psychic impulse which has experienced suppression, similar conditions to those of the child, who cannot distinguish the conscious from the unconscious, are reëstablished. The regression to infantile phobia is the bridge where the transformation of libido into fear is conveniently effected. We have, as you know, spoken a great deal about suppression, but we have always followed the fate of the conception that was to be suppressed, because this was easier to recognize and to present. We have always omitted from our consideration what happened to the emotion that clung to the suppressed idea; and only now we learn that whatever quality this emotion might have manifested under normal conditions, its fate is a transformation into fear. This transformation of emotion is by far the more important part of the suppression process. It is not so easy to discuss, because we cannot assert

the existence of unconscious emotions in the same sense as unconscious ideas. With one difference, an idea remains the same whether it is conscious or unconscious; we can give an account of what corresponds to an unconscious idea. But an emotion is a release and must be judged differently from an idea. Without a deeper reflection and clarification of our hypotheses of psychic processes, we cannot tell what corresponds to its unconscious stage. We cannot undertake this here. But we want to retain the impression we have gained, that the development of anxiety is closely connected with the unconscious system.

I said that the transformation into fear, rather a discharge in the form of fear, is the immediate fate of suppressed libido. Not the only or final fate, I must add. These neuroses are accompanied by processes that strive to restrain the development of fear, and succeed in various ways. In phobias, for instance, two phases of the neurotic process can be clearly distinguished. The first effects the suppression of libido and its transition to fear, which is joined to an external danger. The second consists in building up all those precautions and safety devices which are to prevent contact with this danger which is dealt with as an external fact. Suppression corresponds to the ego's flight from the libido, which it regards dangerous. The phobia is comparable to a fortification against outer danger, which is represented by the much feared libido. The weakness of the phobias' system of defense lies in the fact that the fort has been strengthened from without and has remained vulnerable within. The projection of peril from the libido into the environment is never very successful. In other neuroses, therefore, other systems of defense are used against the possibility of fear development. That is an interesting aspect of the psychology of neurosis. Unfortunately its study would lead us to digress too far, and presupposes a more thorough and special knowledge of the subject. I shall add only one thing more. I have already spoken to you of the counter siege by which the ego imprisons the suppression and which it must maintain permanently for the suppression to subsist. The task of this counter siege is to carry out diverse forms of defense against the fear development which follows the suppression.

To return to the phobias, I may now say that you realize how insufficient it would be to explain only their content, to be interested only in knowing that this or that object or situation is made the subject of a phobia. The content of the phobia has about the same importance for it as

the manifest dream facade has for the dream. With some necessary restrictions, we admit that among the contents of the phobias are some that are especially qualified to be objects of fear through phylogenetic inheritance, as Stanley Hall has emphasized. In harmony with this is the fact that many of these objects of fear can establish connections with danger only by symbolic relations.

And so we are convinced of the central position that the problem of fear assumes in the questions of the neurotic psychology. We are deeply impressed with how closely the development of fear is interwoven with the fate of the libido and the unconscious system. There is only one disconnected point, one inconsistency in our hypothesis: the indisputable fact that real fear must be considered an expression of the ego’s instincts of self-preservation.

TWENTY-SIXTH LECTURE. GENERAL THEORY OF THE NEUROSES

The Libido Theory and Narcism

REPEATEDLY in the past and more recently we have dealt with the distinction between the ego instincts and the sexual instincts. At first, suppression taught us that the two may be flatly opposed to each other, that in the struggle the sexual instincts suffer apparent defeat and are forced to obtain satisfaction by other regressive methods, and so find the compensation for defeat in their invulnerability. After that we learned that at the outset both have a different relation to the educator, Necessity, so that they do not develop in the same manner and do not enter into the same relationship with the principle of reality. We come to realize that the sexual instincts are much more closely allied to the emotional condition of fear than the ego instincts. This result appears incomplete only in one respect, which, however, is most important. For further evidence we shall mention the significant fact that non-satisfaction of hunger and thirst, the two most elementary instincts of self-preservation, never result in their reversal into anxiety, while the transformation of unsatisfied libido into fear is, as we have heard, one of the best known and most frequently observed phenomena.

No one can contest our perfect justification in separating the ego from sexual instincts. It is affirmed by the existence of sexual desire, which is a very special activity of the individual. The only question is, what significance shall we give to this distinction, how decisive is it? The answer will depend upon the results of our observations; on how far the sexual instincts, in their psychological and somatic manifestations, behave differently from the others that are opposed to them; on how important are the consequences which result from these differences. We have, of course, no motive whatever for insisting upon a certain intangible difference in the character of the two groups of instincts. Both are only designations of the sources of energy of the individual. The discussion as to whether they are fundamentally of the same or of a different character, and if the same, when it was that they separated from one another, cannot profit by the conceptions, but must deal rather with the underlying biological facts. At

present we know very little about this, and even if we knew more it would not be relevant to our analytic task.

Obviously, we should gain slight profit if, following the example of Jung, we were to emphasize the original unity of all instincts, and were to call the energy expressed in all of them “libido.” Since the sexual function cannot be eliminated from psychic life by any device, we are forced to speak of sexual and asexual libido. As in the past, we rightly retain the name libido for the instincts of sexual life.

I believe, therefore, that the question, how far the justifiable distinction of the instincts of sex and of self-preservation may be carried, is of little importance for psychoanalysis; and psychoanalysis is moreover not competent to deal with it. From a biological standpoint there are, to be sure, various reasons for believing that this distinction is significant. Sexuality is the only function of the living organism which extends beyond the individual and sees to his kinship with the species. It is undeniable that its practice does not always benefit the individual as do his other performances. For the price of ecstatic pleasures it involves him in dangers which threaten his life and frequently cause death. Probably peculiar metabolic processes, different from all others, are required to maintain a part of the individual life for its progeny. The individual who places himself in the foreground and regards his sexuality as a means to his gratification is, from a biological point of view, only an episode in a series of generations, a transient appendage to a germ-plasm which is virtually endowed with immortality, just as though he were the temporary partner in a corporation which continues to persist after his death.

For psychoanalytic explanation of neuroses, however, there is no need to enter upon these far-reaching implications. By separate observation of the sexual and the ego instincts, we have gained the key to the understanding of transference-neuroses. We were able to trace them back to the fundamental situation where the sexual instinct and the instinct of self-preservation had come in conflict with one another, or biologically although not so accurately, expressed where the part played by the ego, that of independent individuality, was opposed to the other, that of a link in a series of generations. Only human beings are capable of such conflict, and therefore, taken all in all, neurosis is the prerogative of man, and not of animals. The excessive development of his libido and the elaboration of a varied and complicated psychic life thus made possible, appear to have

created the conditions prerequisite for conflict. It is clear that these conditions are also responsible for the great progress that man has made beyond his kinship with animals. The capacity for neurosis is really only the reverse side of his talents and gifts. But these are only speculations, which divert us from our task.

Until now we worked with the impulse that we can distinguish the ego and the sexual instincts from one another by their manifestations. We could do this without difficulty in the transference neuroses. We called the accumulation of energy which the ego directed towards the object of its sexual striving libido and all others, which proceeded from the instincts of self-preservation, interest. We were able to achieve our first insight into the workings of psychic forces by observing the accumulation of the libido, its transformations and its final destiny. The transference neuroses furnished the best material for this. But the ego, composed from various organizations, their construction and functioning, remained hidden and we were led to believe that only the analysis of other neurotic disturbances would raise the veil.

Very soon we began to extend these psychoanalytic conceptions to other conditions. As early as 1908, K. Abraham asserted, after a discussion with me, that the principal characteristic of dementia praecox (which may be considered one of the psychoses) is *that there is no libidinous occupation of objects* (*The Psycho-sexual Differences between Hysteria and Dementia Praecox*). But then the question arose, what happens to the libido of the demented, which is diverted from its objects? Abraham did not hesitate to give the answer, “It is turned back upon the ego, and *this reflected turning back is the source of the megalomania* in dementia praecox.” This hallucination of greatness is exactly comparable to the well-known over-estimation of the objects habitual to lovers. So, for the first time, we gained an understanding of psychotic condition by comparing it with the normal course of love.

These first interpretations of Abraham’s have been maintained in psychoanalysis, and have become the basis of our attitude towards the psychoses. Slowly we familiarized ourselves with the idea that the libido, which we find attached to certain objects, which expresses a striving to attain gratification from these objects, may also forsake them and put in their place the person’s own ego. Gradually these ideas were developed more and more consistently. The name for this placing of the libido —

narcism — was borrowed from one of the perversions described by P. Naecke. In it the grown individual lavishes upon his own body all the affection usually devoted to some foreign sex object.

We reflected that if such a fixation of libido on one's own body and person instead of on some external object exists, this cannot be an exceptional or trivial occurrence. It is much more probable that this narcism is the general and original condition, out of which the love for an object later develops, without however necessarily causing narcism to disappear. From the evolutionary history of object-libido we remembered that in the beginning many sex instincts seek auto-erotic gratification, and that this capacity for auto-eroticism forms the basis for the retardation of sexuality in its education to conformity with fact. And so, auto-eroticism was the sexual activity of the narcistic stage in the placing of the libido.

To be brief: We represented the relation of the ego-libido to the object-libido in a way which I can explain by an analogy from zoology. Think of the simplest forms of life, which consist of a little lump of protoplasmic substance which is only slightly differentiated. They stretch out protrusions, known as pseudopia, into which the protoplasm flows. But they can withdraw these protrusions and assume their original shape. Now we compare the stretching out of these processes with the radiation of libido to the objects, while the central mass of libido can remain in the ego, and we assume that under normal conditions ego-libido can be changed into object-libido, and this can again be taken up into the ego, without any trouble.

With the help of this representation we can now explain a great number of psychic conditions, or to express it more modestly, describe them, in the language of the libido theory; conditions that we must accredit to normal life, such as the psychic attitude during love, during organic sickness, during sleep. We assumed that the conditions of sleep rest upon withdrawal from the outer world and concentration upon the wish to sleep. The nocturnal psychic activity expressed in the dream we found in the service of a wish to sleep and, moreover, governed by wholly egoistic motives. Continuing in the sense of libido theory: sleep is a condition in which all occupations of objects, the libidinous as well as the egoistic, are given up, and are withdrawn into the ego. Does this not throw a new light upon recovery during sleep, and upon the nature of exhaustion in general? The picture of blissful isolation in the intra-uterine life, which the sleeper

conjures up night after night, thus also completes the picture from the psychic side. In the sleeper the original condition of libido division is again restored, a condition of complete narcism in which libido and ego-interest are still united and live indistinguishably in the self-sufficient ego.

We must observe two things: First, how can the conceptions of narcism and egoism be distinguished? I believe narcism is the libidinous complement of egoism. When we speak of egoism we mean only the benefits to the individual; if we speak of narcism we also take into account his libidinous satisfaction. As practical motives the two can be followed up separately to a considerable degree. One can be absolutely egoistic, and still have strong libidinous occupation of objects, in so far as the libidinous gratification by way of the object serves the needs of the ego. Egoism will then take care that the striving for the object results in no harm to the ego. One can be egoistic and at the same time excessively narcistic, i.e., have very slight need of an object. This need may be for direct sexual satisfaction or even for those higher desires, derived from need, which we are in the habit of calling love as opposed to sensuality. In all of these aspects, egoism is the self-evident, the constant, and narcism the variable element. The antithesis of egoism, *altruism,* is not the same as the conception of libidinous occupation of objects. Altruism differs from it by the absence of desire for sexual satisfaction. But in the state of being completely in love, altruism and libidinous occupation with an object clash. The sex object as a rule draws upon itself a part of the narcism of the ego. This is generally called “sexual over-estimation” of the object. If the altruistic transformation from egoism to the sex object is added, the sex object becomes all powerful; it has virtually sucked up the ego.

I think you will find it a pleasant change if after the dry phantasy of science I present to you a poetic representation of the economic contrast between narcism and being in love. I take it from the *Westostliche Divans* of Goethe:

SULEIKA:
Conqueror and serf and nation;
They proclaim it joyously;
Mankind’s loftiest elation,
Shines in personality.

Life’s enchantment lures and lingers,
Of yourself is not afar,
All may slip through passive fingers,
If you tarry as you are.

HATEM:
Never could I be thus ravished,
Other thoughts are in my mind,
All the gladness earth has lavished
In Suleika’s charms I find.
When I cherish her, then only
Dearer to myself I grow,
If she turned to leave me lonely
I should lose the self I know.
Hatem’s happiness were over, —
But his changeling soul would glide
Into any favored lover
Whom she fondles at her side.

The second observation is supplementary to the dream theory. We cannot explain the origin of the dream unless we assume that the suppressed unconscious has achieved a certain independence of the ego. It does not conform to the wish for sleep and retains its hold on the energies that have seized it, even when all the occupations with objects dependent upon the ego have been released for the benefit of sleep. Not until then can we understand how this unconscious can take advantage of the nocturnal discontinuance or deposition of the censor, and can seize control of fragments left over from the day to fashion a forbidden dream wish from them. On the other hand, it is to the already existing connections with these supposed elements that these fragments owe a part of the resistance directed against the withdrawal of the libido, and controlled by the wish

for sleep. We also wish to supplement our conception of dream formation with this trait of dynamic importance.

Organic diseases, painful irritations, inflammation of the organs create a condition which clearly results in freeing the libido of its objects. The withdrawn libido again finds itself in the ego and occupies the diseased part of the part. We may even venture to assert that under these conditions the withdrawal of the libido from its objects is more conspicuous than the withdrawal of egoistic interest from the outside world. This seems to open the way to an understanding of hypochondria, where an organ occupies the ego in a similar way without being diseased, according to our conception. I shall resist the temptation of continuing along this line, or of discussing other situations which we can understand or represent through the assumption that the object libido travels to the ego. For I am eager to meet two objections, which I know are absorbing your attention. In the first place, you want to call me to account for my insistence upon distinguishing in sleep, in sickness and in similar situations between libido and interest, sexual instincts and ego instincts, since throughout the observations can be explained by assuming a single and uniform energy, which, freely mobile, occupies now the object, now the ego, and enters into the services of one or the other of these impulses. And, secondly, how can I venture to treat the freeing of libido from its object as the source of a pathological condition, since such transformation of object-libido into ego-libido — or more generally, ego-energy — belongs to the normal, daily and nightly repeated occurrences of psychic dynamics?

The answer is: Your first objection sounds good. The discussion of the conditions of sleep, of sickness and of being in love would in themselves probably never have led to a distinction between ego-libido and object-libido, or between libido and interest. But you do not take into account the investigations from which we have set out, in the light of which we now regard the psychic situations under discussion. The necessity of distinguishing between libido and interest, that is, between sexual instincts and those of self-preservation, is forced upon us by our insight into the conflict out of which the transference neuroses emerge. We can no longer reckon without it. The assumption that object-libido can change into the ego-libido, in other words, that we must reckon with an ego-libido, appeared to us the only possible one wherewith to solve the riddle of the so-called narcistic neuroses — for instance, dementia praecox — or to

justify the similarities and differences in a comparison of hysteria and compulsion. We now apply to sickness, sleep and love that which we found undeniably affirmed elsewhere. We may proceed with such applications as far as they will go. The only assertion that is not a direct refutation of our analytic experience is that libido remains libido whether it is directed towards objects or toward the ego itself, and is never transferred into egoistic interest, and vice-versa. But this assertion is of equal weight with the distinction of sex and ego instincts which we have already critically appraised, and which we will maintain from methodological motives until it may possibly be disproved.

Your second objection, too, raises a justified question, but it points in a wrong direction. To be sure the retreat of object-libido into the ego is not purely pathogenic; we see that it occurs each time before going to sleep, only to be released again upon awaking. The little protoplasmic animal draws in its protrusions, only to send them out again on a later occasion. But it is quite another matter when a specific, very energetic process compels the withdrawal of libido from the object. The libido has become narcistic and cannot find its way back to the object, and this hindrance to the mobility of the libido certainly becomes pathogenic. It appears that an accumulation of narcistic libido cannot be borne beyond a certain point. We can imagine that the reason for occupation with the object is that the ego found it necessary to send out its libido in order not to become diseased because it was pent up. If it were our plan to go further into the subject of dementia praecox, I would show you that this process which frees the libido from the objects and bars the way back to them, is closely related to the process of suppression, and must be considered as its counterpart. But above all you would recognize familiar ground, for the conditions of these processes are practically identical, as far as we can now see, with those of suppression. The conflict appears to be the same, and to take place between the same forces. The reason for a result as different as, for instance, the result in hysteria, can be found only in a difference of dispositions. The vulnerable point in the libido development of these patients lies in another phase; the controlling fixation, which, as you will remember, permits the breach resulting in the formation of symptoms, is in another place probably in the stage of primitive narcism, to which dementia praecox returns in its final stage. It is noteworthy that for all the narcistic neuroses, we must assume fixation points of the libido

which reach back into far earlier phases of development than in cases of hysteria or compulsion neuroses. But you have heard that the conceptions obtained in our study of transference neuroses are sufficient to orient us in the narcistic neuroses, which present far greater practical difficulties. The similarities are considerable; it is fundamentally the same field of observation. But you can easily imagine how hopeless the explanations of these conditions, which belong to psychiatry, appear to him who is not equipped for this task with an analytic knowledge of transference neuroses.

The picture given by the symptoms of dementia praecox, which, moreover, is highly variable, is not exclusively determined by the symptoms. These result from forcing the libido away from the objects and accumulating it in the ego in the form of narcistic libido. A large space is occupied by other phenomena, which result from the impulses of the libido to regain the objects, and so show an attempt toward restitution and healing. These symptoms are in fact the more conspicuous, the more clamorous; they show an unquestionable similarity to those of hysteria, or less often to those of compulsion neurosis, and yet they are different in every respect. It appears that in dementia praecox the libido in its endeavor to return to the objects, i.e., to the images of the objects, really captures something, but only their shadows — I mean, the verbal images belonging to them. This is not the place to discuss this matter, but I believe that these reversed impulses of the libido have permitted us an insight into what really determines the difference between a conscious and an unconscious representation.

I have now brought you into the field where we may expect the further progress of analytic work. Since we can now employ the conception of ego-libido, the narcistic neuroses have become accessible to us. We are confronted with the problem of finding a dynamic explanation of these conditions and at the same time of enlarging our knowledge of psychic life by an understanding of the ego. The ego psychology, which we strive to understand, must not be founded upon introspective data, but rather, as in the libido, upon analysis of the disturbances and decompositions of the ego. When this greater task is accomplished we shall probably disparage our previous knowledge of the fate of the libido which we gained from our study of the transference neuroses. But there is still much to be said in this matter. Narcistic neuroses can scarcely be approached by the same

technique which served us in the transference neuroses. Soon you will hear why. After forging ahead a little in the study of narcistic neuroses we always seem to come to a wall which impedes progress. You know that in the transference neuroses we also encountered such barriers of resistance, but we were able to break them down piece by piece. In narcistic neuroses the resistance is insuperable; at best we are permitted to cast a curious glance over the wall to spy out what is taking place on the other side. Our technical methods must be replaced by others; we do not yet know whether or not we shall be able to find such a substitute. To be sure, even these patients furnish us with ample material. They do say many things, though not in answer to our questions, and for the time being we are forced to interpret these utterances through the understanding we have gained from the symptoms of transference neuroses. The coincidence is sufficiently great to assure us a good beginning. How far this technique will go, remains to be seen.

There are additional difficulties that impede our progress. The narcistic conditions and the psychoses related to them can only be solved by observers who have schooled themselves in analytic study of transference neuroses. But our psychiatrists do not study psychoanalysis and we psychoanalysts see too few psychiatric cases. A race of psychiatrists that has gone through the school of psychoanalysis as a preparatory science most first grow up. The beginnings of this are now being made in America, where many leading psychiatrists explain the teachings of psychoanalysis to their students, and where many owners of sanatoriums and directors of institutes for the insane take pains to observe their patients in the light of these teachings. But even here we have occasionally been successful in casting a glance over the narcistic wall and I shall tell you a few things that we think we have discovered.

The disease of paranoia, chronic systematic insanity, is given a very uncertain position by the attempts at classification of present-day psychiatry. There is no doubt of its close relationship to dementia praecox. I once was so bold as to propose that paranoia and dementia praecox could be classed together under the common name of paraphrenia. The types of paranoia are described according to their content as: megalomania, the mania of persecution, eroto mania, mania of jealousy, etc. From psychiatry we do not expect attempts at explanation. As an example of such an attempt, to be sure an antiquated and not entirely valid example, I might

mention the attempt to develop one symptom directly out of another by means of an intellectual rationalization, as: the patient who primarily believes he is being persecuted draws the conclusion from this persecution that he must be an extraordinarily important personality and thus develops megalomania. In our analytical conception megalomania is the immediate outcome of exaggeration of the ego, which results from the drawing-in of libidinous occupation with objects, a secondary narcism as a recurrence of the originally early infantile form. In cases of the mania of persecution we have noticed a few things that lead us to follow a definite track. In the first place, we observed that in the great majority of cases the persecutor was of the same sex as the persecuted. This could still be explained in a harmless way, but in a few carefully studied cases it was clearly shown that the person of the same sex, who was most loved in normal times, became the persecutor after the malady set in. A further development is made possible by the fact that one loved person is replaced by another, according to familiar affinities, e.g., the father by the teacher or the superior. We concluded from such ever-increasing experiences, that paranoia persecutoria is the form in which the individual guards himself against a homosexual tendency that has become too powerful. The change from affection to hate, which notoriously may take the form of serious threats against the life of the loved and hated person, expresses the transformation of libidinous impulse into fear, which is a regularly recurring result of the process of suppression. As an illustration I shall cite the last case in which I made observations on this subject. A young physician had to be sent away from his home town because he had threatened the life of the son of a university professor, who up to that time had been his best friend. He ascribed truly devilish intentions to his erstwhile friend and credited him with power of a demon. He was to blame for all the misfortunes that had in recent years befallen the family of the patient, for all his personal and social ill-luck. But this was not enough. The wicked friend, and his father the professor, had been the cause of the war and had called the Russians into the land. He had forfeited his life a thousand times and our patient was convinced that with the death of the culprit all misfortune would come to an end. And yet his old affection for his friend was so great that it had paralyzed his hand when he had had the opportunity of shooting down the enemy at close quarters. In my short consultations with the patient, I discovered that the friendship between the two dated back to early school-

life. Once at least the bonds of friendship had been over-stepped; a night spent together had been the occasion for complete sexual intercourse. Our patient never felt attracted to women, as would have been natural to his age or his charming personality. At one time he was engaged to a beautiful and distinguished young girl, but she broke off the engagement because she found so little affection in her fiancé. Years later his malady broke out just at that moment when for the first time he had succeeded in giving complete gratification to a woman. When this woman embraced him, full of gratitude and devotion, he suddenly felt a strange pain which cut around his skull like a sharp incision. His later interpretation of this sensation was that an incision such as is used to expose a part of the brain had been performed upon him, and since his friend had become a pathological anatomist, he gradually came to the conclusion that he alone could have sent him this last woman as a temptation. From that time on his eyes were also opened to the other persecutions in which he was to be the victim of the intrigues of his former friend.

But how about those cases where the persecutor is not of the same sex as the persecuted, where our explanation of a guard against homosexual libido is apparently contradicted? A short time ago I had occasion to investigate such a case and was able to glean corroboration from this apparent contradiction. A young girl thought she was followed by a man, with whom she had twice had intimate relations. She had, as a matter of fact, first laid these maniacal imputations at the door of a woman, whom we may consider as having played the part of a mother-substitute in her psychic life. Only after the second meeting did she progress to the point of diverting this maniacal idea from the woman and of transferring it to the man. The condition that the persecutor must be of the same sex was also originally maintained in this instance. In her claim before the lawyer and the physician, this patient did not mention this first stage of her mania, and this caused the appearance of a contradiction to our theory of paranoia.

Homosexual choice of object is originally more natural to narcism than the heterosexual. If it is a matter of thwarting a strong and undesirable homosexual impulse, the way back to narcism is made especially easy. Until now I have had very little opportunity of speaking to you about the fundamental conditions of love-life, so far as we know them, and now I cannot make up for lost time. I only want to point out that the choice of an

object, that progress in the development of the libido which comes after the narcistic stage, can proceed according to two different types — either according to the *narcistic* type, which puts a very similar personality in the place of the personal ego, or according to the *dependent* type, which chooses those persons who have become valuable by satisfying needs of life other than as objects of the libido. We also accredit a strong fixation of the libido to the narcistic type of object-choice when there is a disposition toward manifest homosexuality.

You will recall that in our first meeting of this semester I told you about the case of a woman who suffered from the mania of jealousy. Since we are so near the end you certainly will be glad to hear the psychoanalytic explanation of a maniacal idea. But I have less to say about it than you expect. The maniacal idea as well as the compulsion idea cannot be assailed by logical arguments or actual experience. This is explained by their relation to the unconscious, which is represented by the maniacal idea or the compulsion idea, and held down by whichever is effective. The difference between the two is based upon respective localization and dynamic relations of the two conditions.

As in paranoia, so also in melancholia, of which, moreover, very different clinical forms are described. We have discovered a point of vantage which will yield us an insight into the inner structure of the condition. We realize that the self-accusations with which these melancholic patients torture themselves in the most pitiless way, really apply to another person, namely, the sex object which they have lost, or which through some fault has lost value for them. From this we may conclude that the melancholic has withdrawn his libido from the object. Through a process which we designate as “narcistic identification” the object is built up within the ego itself, is, so to say, projected upon the ego. Here I can give you only a descriptive representation, as yet without reference to the topical and dynamic relations. The personal ego is now treated in the same manner as the abandoned object, and suffers all the aggression and expressions of revenge which were planned for the object. Even the suicidal tendencies of melancholia are more comprehensible when we consider that this bitterness of the patient falls alike on the ego itself and on the object of its love and hate. In melancholia as well as in other narcistic conditions a feature of emotional life is strikingly shown which, since the time of Bleuler, we have been accustomed to designate as

ambivalence. By this we mean that hostile and affectionate feelings are directed against one and the same person. I have, in the course of these discussions, unfortunately not been in a position to tell you more about this emotional ambivalence.

We have, in addition to narcistic identification, an hysterical identification as well, which moreover has been known to us for a much longer time. I wish it were possible to determine clearly the difference between the two. Of the periodic and cyclic forms of melancholia I can tell you something that you will certainly be glad to hear, for it is possible, under favorable circumstances — I have twice had the experience — to prevent these emotional conditions (or their antitheses) by means of analytic treatment in the free intervals between the attacks. We learn that in melancholia as well as in mania, it is a matter of finding a special way for solving the conflict, the prerequisites for which entirely coincide with those of other neuroses. You can imagine how much there still is for psychoanalysis to learn in this field.

I told you, too, that we hoped to gain a knowledge of the structure of the ego, and of the separate factors out of which it is built by means of the analysis of narcistic conditions. In one place we have already made a beginning. From the analysis of the maniacal delusion of being watched we concluded that in the ego there is really an agent which continually watches, criticizes and compares the other part of the ego and thus opposes it. We believe that the patient imparts to us a truth that is not yet sufficiently appreciated, when he complains that all his actions are spied upon and watched, all his thoughts recorded and criticized. He errs only in transferring this distressing force to something alien, outside of himself. He feels the dominance of a factor in his ego, which compares his actual ego and all of its activities to an *ideal ego* that he has created in the course of his development. We also believe that the creation of this ideal ego took place with the purpose of again establishing that self-satisfaction which is bound up with the original infantile narcism, but which since then has experienced so many disturbances and disparagements. In this self-observing agent we recognize the ego-censor, the conscience; it is the same factor which at night exercises dream-censorship, and which creates the suppressions against inadmissible wish-impulses. Under analysis in the maniacal delusion of being watched it reveals its origin in the

influence of parents, tutors and social environment and in the identification of the ego with certain of these model individuals.

These are some of the conclusions which the application of psychoanalysis to narcistic conditions has yielded us. They are certainly all too few, and they often lack that accuracy which can only be acquired in a new field with the attainment of absolute familiarity. We owe them all to the exploitation of the conception of ego-libido or narcistic libido, by the aid of which we have extended to narcistic neuroses those observations which were confirmed in the transference neuroses. But now you will ask, is it possible for us to succeed in subordinating all the disturbances of narcistic conditions and the psychoses to the libido theory in such a way that in every case we recognize the libidinous factor of psychic life as the cause of the malady, and never make an abnormality in the functioning of the instincts of self-preservation answerable? Ladies and gentlemen, this conclusion does not seem urgent to me, and above all not ripe for decision. We can best leave it calmly to the progress of the science. I should not be surprised to find that the power to exert a pathogenic influence is really an exclusive prerogative of the libidinous impulses, and that the libido theory will celebrate its triumphs along the whole line from the simplest true neurosis to the most difficult psychotic derangement of the individual. For we know it to be a characteristic of the libido that it is continually struggling against subordinating itself to the realities of the world. But I consider it most probable that the ego instincts are indirectly swept along by the pathogenic excitations of the libido and forced into a functional disturbance. Moreover, I cannot see any defeat for our trend of investigation when we are confronted with the admission that in difficult psychoses the ego impulses themselves are fundamentally led astray; the future will teach us — or at least it will teach you. Let me return for one moment more to fear, in order to eliminate one last ambiguity that we have left. We have said that the relation between fear and the libido, which in other respects seems clearly defined, does not fit in with the assumption that in the face of danger real fear should become the expression of the instinct of self-preservation. This, however, can hardly be doubted. But suppose the emotion of fear is not contested by the egoistic ego impulse, but rather by the ego-libido? The condition of fear is in all cases purposeless and its lack of purpose is obvious when it reaches a higher level. It then disturbs the action, be it flight or defense, which alone is

purposeful, and which serves the ends of self-preservation. If we accredit the emotional component of actual fear to the ego-libido, and the accompanying activity to the egoistic instinct to self-preservation, we have overcome every theoretical difficulty. Furthermore, you do not really believe that we flee *because* we experience fear? On the contrary, we first are afraid *and then* take to flight from the same motive that is awakened by the realization of danger. Men who have survived the endangering of their lives tell us that they were not at all afraid, they only acted. They turned the weapon against the wild animal, and that was in fact the most purposeful thing to do.

TWENTY-SEVENTH LECTURE. GENERAL THEORY OF THE NEUROSES

Transference

WE are nearing the close of our discussions, and you probably cherish certain expectations, which shall not be disappointed. You think, I suppose, that I have not guided you through thick and thin of psychoanalytic subject matter to dismiss you without a word about therapy, which furnishes the only possibility of carrying on psychoanalysis. I cannot possibly omit this subject, for the observation of some of its aspects will teach you a new fact, without which the understanding of the diseases we have examined would be most incomplete.

I know that you do not expect any guidance in the technique of practising analysis for therapeutic purposes. You wish to know only along what general lines psychoanalytic therapy works and approximately what it accomplishes. And you have an undeniable right to know this. I shall not actually tell you, however, but shall insist that you guess it yourselves.

Only think! You know everything essential, from the conditions which precipitate the illness to all the factors at work within. Where is there room for therapeutic influence? In the first place, there is hereditary disposition; we do not speak of it often because it is strongly emphasized from another quarter, and we have nothing new to say about it. But do not think that we underestimate it. Just because we are therapeutists, we feel its power distinctly. At any rate, we cannot change it; it is a given fact which erects a barrier to our efforts. In the second place, there is the influence of the early experiences of childhood, which are in the habit of becoming sharply emphasized under analysis; they belong to the past and we cannot undo them. And then everything that we include in the term “actual forbearance” — misfortunes of life out of which privations of love arise, poverty, family discord, unfortunate choice in marriage, unfavorable social conditions and the severity of moral claims. These would certainly offer a foothold for very effectual therapy. But it would have to be the kind of therapy which, according to the Viennese folk-tale, Emperor Joseph practiced: the beneficial interference of a potentate, before whose will men bow and difficulties vanish. But who are we, to include such charity

in the methods of our therapy? Poor as we are, powerless in society, forced to earn our living by practicing medicine, we are not even in a position to treat free of charge those patients who are unable to pay, as physicians who employ other methods of treatment can do. Our therapy is too long drawn-out, too extended for that. But perhaps you are still holding to one of the factors already mentioned, and think that you have found a factor through which our influence may be effective. If the restrictions of morality which are imposed by society have a share in the privation forced upon the patient, treatment might give him the courage, or possibly even the prescription itself, to cross these barriers, might tell him how gratification and health can be secured in the renunciation of that ideal which society has held up to us but often disregards. One grows healthy then, by giving one's sexuality full reign. Such analytic treatment, however, would be darkened by a shadow; it does not serve our recognized morality. The gain to the individual is a loss to society.

But, ladies and gentlemen, who has misinformed you to this degree? It is inconceivable that the advice to give one's sexuality full reign can play a part in analytic therapy, if only from the circumstance we have ourselves described, that there is going on within the patient a bitter conflict between libidinous impulse and sexual suppression, between sensual and ascetic tendencies. This conflict is not abolished by giving one of these tendencies the victory over its opponent. We see that in the case of the nervous, asceticism has retained the upper hand. The consequence of this is that the suppressed sexual desire gains breathing space by the development of symptoms. If, on the other hand, we were to give the victory to sexuality, symptoms would have to replace the sexual suppression, which has been pushed aside. Neither of the two decisions can end the inner conflict, one part always remains unsatisfied. There are only a few cases wherein the conflict is so labile, that a factor such as the intervention of the physician could be decisive, and these cases really require no analytic treatment. Persons who can be so much influenced by a physician would have found some solution without him. You know that when an abstinent young man decides upon illegitimate sex-intercourse, or when an unsatisfied woman seeks compensation from another man, they have generally not waited for the permission of a physician, far less of an analyst, to do this.

In studying the situation, one essential point is generally overlooked, that the pathogenic conflict of the neurotic must not be confused with normal struggles between psychic impulses of which all have their root in the same psychological soil. The neurotic struggle is a strife of forces, one of which has attained the level of the fore-conscious and the conscious, while the other has been held back in the unconscious stage. That is why the conflict can have no outcome; the struggling parties approach each other as little as in the well-known instance of the polar-bear and the whale. A real decision can be reached only if both meet on the same ground. To accomplish this is, I believe, the sole task of therapy.

Moreover, I assure you that you are misinformed if you assume that advice and guidance in the affairs of life is an integral part of the analytic influence. On the contrary, we reject this role of the mentor as far as possible. Above all, we wish to attain independent decisions on the part of the patient. With this intention in mind, we require him to postpone all vital resolutions such as choice of a career, marriage or divorce, until the close of the treatment. You must confess that this is not what you had imagined. It is only in the case of certain very young or entirely helpless persons that we cannot insist upon the desired limitation. Here we must combine the function of physician and educator; we are well aware of the responsibility and behave with the necessary precaution.

Judging from the zeal with which I defend myself against the accusation that analytic treatment urges the nervous person to give his sexuality full reign, you must not gather that we influence him for the benefit of conventional morality. We are just as far removed from that. We are no reformers, it is true, only observers, but we cannot help observing with critical eyes, and we have found it impossible to take the part of conventional sex morality, or to estimate highly the way in which society has tried to regulate the problems of sexual life in practice. We can prove to society mathematically that its code of ethics has exacted more sacrifices than is its worth, and that its procedure rests neither on veracity nor wisdom. We cannot spare our patients the task of listening to this criticism. We accustom them to weigh sexual matters, as well as others, without prejudice; and when, after the completion of the cure, they have become independent and choose some intermediate course between unrestrained sexuality and asceticism, our conscience is not burdened by the consequences. We tell ourselves: whoever has been successfully

educated in being true to himself is permanently protected against the danger of immorality, even if his moral standard diverges from that of society. Let us, moreover, be careful not to overestimate the significance of the problem of abstinence with respect to its influence on neuroses. Only the minority of pathogenic situations of forbearance, with a subsequent condition of pent-up libido, can be resolved without more ado by such sexual intercourse as can be procured with little trouble.

And so you cannot explain the therapeutic influence of psychoanalysis by saying that it simply recommends giving full sway to sexuality. You must seek another solution. I think that while I was refuting this supposition of yours, one of my remarks put you on the right track. Our usefulness consists in replacing the unconscious by the conscious, in translating the unconscious into the conscious. You are right; that is exactly it. By projecting the unconscious into the conscious, we do away with suppressions, we remove conditions of symptom formation and transform a pathogenic into a normal conflict which can be decided in some way or other. This is the only psychic change we produce in our patients; its extent is the extent of our helpfulness. Wherever no suppression and no analogous psychic process can be undone, there is no place for our therapy.

We can express the aim of our efforts by various formulae of rendering the unconscious conscious, removing suppressions, filling out amnestic gaps — it all amounts to the same thing. But perhaps this admission does not satisfy you. You imagined that when a nervous person became cured something very different happened, that after having been subjected to the laborious process of psychoanalysis, he was transformed into a different human being. And now I tell you that the entire result is only that he has a little less of the unconscious, a little more of the conscious within him. Well, you probably underestimate the significance of such an inner change. The person cured of neurosis has really become another human being. Fundamentally, of course, he has remained the same. That is to say, he has only become what he might have been under the most favorable conditions. But that is saying a great deal. When you learn all that has to be done, the effort required to effect apparently so slight a change in psychic life, the significance of such a difference in the psychic realm will be credible to you.

I shall digress for a moment to ask whether you know what is meant by a causal therapy? This name is given to the procedure which does not take the manifestations of disease for its point of departure, but seeks to remove the causes of disease. Is our psychoanalytical therapy causal or not? The answer is not simple, but perhaps it will give us the opportunity of convincing ourselves that this point of departure is comparatively fruitless. In so far as analytical therapy does not concern itself immediately with the removal of symptoms, it may be termed causal. Yet in another respect, you might say this would hardly follow. For we have followed the causal chain back far beyond the suppressions to the instinctive tendencies and their relative intensity as given by the constitution of the patient, and finally the nature of the digression in the abnormal process of its development. Assume for a moment that it were possible to influence these functions chemically, to increase or to decrease the quantity of the libido that happens to be present, to strengthen one impulse at the expense of another. This would be causal therapy in its true sense and our analysis would have furnished the indispensable preparatory work of reconnaissance. You know that there is as yet no possibility of so influencing the processes of the libido. Our psychic therapy interposes elsewhere, not exactly at those sources of the phenomena which have been disclosed to us, but sufficiently far beyond the symptoms, at an opening in the structure of the disease which has become accessible to us by means of peculiar conditions.

What must we do in order to replace the unconscious by the conscious in our patient? At one time we thought this was quite simple, that all we had to do was to reconstruct the unconscious and then tell the patient about it. But we already know this was a shortsighted error. Our knowledge of the unconscious has not the same value as his; if we communicate our knowledge to him it will not stand *in place of* the unconscious within him, but will exist *beside* it, and only a very small change will have been effected. We must rather think of the unconscious as *localized*, and must seek it in memory at the point where it came into existence by means of a suppression. This suppression must be removed before the substitution of the conscious for the unconscious can be successfully effected. How can such a suppression be removed? Here our task enters a second phase. First to find the suppression, then to remove the resistance by which this suppression is maintained.

How can we do away with resistance? In the same way — by reconstructing it and confronting the patient with it. For resistance arises from suppression, from the very suppression which we are trying to break up, or from an earlier one. It has been established by the counter-attack that was instigated to suppress the offensive impulse. And so now we do the very thing we intended at the outset: interpret, reconstruct, communicate — but now we do it in the right place. The counter-seizure of the idea or resistance is not part of the unconscious but of the ego, which is our fellow-worker. This holds true even if resistance is not conscious. We know that the difficulty arises from the ambiguity of the word "unconscious," which may connote either a phenomenon or a system. That seems very difficult, but it is only a repetition, isn't it? We were prepared for it a long time ago. We expect resistance to be relinquished, the counter-siege to collapse, when our interpretation has enabled the ego to recognize it. With what impulses are we able to work in such a case? In the first place, the patient's desire to become well, which has led him to accommodate himself to co-operate with us in the task of the cure; in the second place, the help of his intelligence, which is supported by the interpretation we offer him. There is no doubt that after we have made clear to him what he may expect, the patient's intelligence can identify resistances, and find their translation into the suppressions more readily. If I say to you, "Look up into the sky, you can see a balloon there," you will find it more readily than if I had just asked you to look up to see whether you could discover anything. And unless the student who for the first time works with a microscope is told by his teacher what he may look for, he will not see anything, even if it is present and quite visible.

And now for the fact! In a large number of forms of nervous illness, in hysteria, conditions of anxiety and compulsion neuroses, one hypothesis is correct. By finding the suppression, revealing resistance, interpreting the thing suppressed, we really succeed in solving the problem, in overcoming resistance, in removing suppression, in transforming the unconscious into the conscious. While doing this we gain the clearest impression of the violent struggle that takes place in the patient's soul for the subjugation of resistance — a normal psychological struggle, in one psychic sphere between the motives that wish to maintain the counter-siege and those which are willing to give it up. The former are the old motives that at one time effected suppression; among the latter are those that have recently

entered the conflict, to decide it, we trust, in the sense we favor. We have succeeded in reviving the old conflict of the suppression, in reopening the case that had already been decided. The new material we contribute consists in the first place of the warning, that the former solution of the conflict had led to illness, and the promise that another will pave the way to health; secondly, the powerful change of all conditions since the time of that first rejection. At that time the ego had been weak, infantile and may have had reason to denounce the claims of the libido as if they were dangerous. Today it is strong, experienced and is supported by the assistance of the physician. And so we may expect to guide the revived conflict to a better issue than a suppression, and in hysteria, fear and compulsion neuroses, as I have said before, success justifies our claims.

There are other forms of illness, however, in which our therapeutic procedure never is successful, even though the causal conditions are similar. Though this may be characterized topically in a different way, in them there was also an original conflict between the ego and libido, which led to suppression. Here, too, it is possible to discover the occasions when suppressions occurred in the life of the patient. We employ the same procedure, are prepared to furnish the same promises, give the same kind of help. We again present to the patient the connections we expect him to discover, and we have in our favor the same interval in time between the treatment and these suppressions favoring a solution of the conflict; yet in spite of these conditions, we are not able to overcome the resistance, or to remove the suppression. These patients, suffering from paranoia, melancholia, and dementia praecox, remain untouched on the whole, and proof against psychoanalytic therapy. What is the reason for this? It is not lack of intelligence; we require, of course, a certain amount of intellectual ability in our patients; but those suffering from paranoia, for instance, who effect such subtle combinations of facts, certainly are not in want of it. Nor can we say that other motive forces are lacking. Patients suffering from melancholia, in contrast to those afflicted with paranoia, are profoundly conscious of being ill, of suffering greatly, but they are not more accessible. Here we are confronted with a fact we do not understand, which bids us doubt if we have really understood all the conditions of success in other neuroses.

In the further consideration of our dealings with hysterical and compulsion neurotics we soon meet with a second fact, for which we were

not at all prepared. After a while we notice that these patients behave toward us in a very peculiar way. We thought that we had accounted for all the motive forces that could come into play, that we had rationalized the relation between the patient and ourselves until it could be as readily surveyed as an example in arithmetic, and yet some force begins to make itself felt that we had not considered in our calculations. This unexpected something is highly variable. I shall first describe those of its manifestations which occur frequently and are easy to understand.

We see our patient, who should be occupying himself only with finding a way out of his painful conflicts, become especially interested in the person of the physician. Everything connected with this person is more important to him than his own affairs and diverts him from his illness. Dealings with him are very pleasant for the time being. He is especially cordial, seeks to show his gratitude wherever he can, and manifests refinements and merits of character that we hardly had expected to find. The physician forms a very favorable opinion of the patient and praises the happy chance that permitted him to render assistance to so admirable a personality. If the physician has the opportunity of speaking to the relatives of the patient he hears with pleasure that this esteem is returned. At home the patient never tires of praising the physician, of prizing advantages which he constantly discovers. “He adores you, he trusts you blindly, everything you say is a revelation to him,” the relatives say. Here and there one of the chorus observes more keenly and remarks, “It is a positive bore to hear him talk, he speaks only of you; you are his only subject of conversation.”

Let us hope that the physician is modest enough to ascribe the patient’s estimation of his personality to the encouragement that has been offered him and to the widening of his intellectual horizon through the astounding and liberating revelations which the cure entails. Under these conditions analysis progressed splendidly. The patient understands every suggestion, he concentrates on the problems that the treatment requires him to solve, reminiscences and ideas flood his mind. The physician is surprised by the certainty and depth of these interpretations and notices with satisfaction how willingly the sick man receives the new psychological facts which are so hotly contested by the healthy persons in the world outside. An objective improvement in the condition of the patient, universally

admitted, goes hand in hand with this harmonious relation of the physician to the patient under analysis.

But we cannot always expect to have fair weather. There comes a day when the storm breaks. Difficulties turn up in the treatment. The patient asserts that he can think of nothing more. We are under the impression that he is no longer interested in the work, that he lightly passes over the injunction that, heedless of any critical impulse, he must say everything that comes to his mind. He behaves as though he were not under treatment, as though he had closed no agreement with the physician; he is clearly obsessed by something he does not wish to divulge. This is a situation which endangers the success of the treatment. We are distinctly confronted with a tremendous resistance. What can have happened?

Provided we are able once more to clarify the situation, we recognize the cause of the disturbance to have been intense affectionate emotions, which the patient has transferred to the physician. This is certainly not justified either by the behavior of the physician or by the relations the treatment has created. The way in which this affection is manifested and the goals it strives for will depend on the personal affiliations of the two parties involved. When we have here a young girl and a man who is still young we receive the impression of normal love. We find it quite natural that a girl should fall in love with a man with whom she is alone a great deal, with whom she discusses intimate matters, who appears to her in the advantageous light of a beneficent adviser. In this we probably overlook the fact that in a neurotic girl we should rather presuppose a derangement in her capacity to love. The more the personal relations of physician and patient diverge from this hypothetical case, the more are we puzzled to find the same emotional relation over and over again. We can understand that a young woman, unhappy in her marriage, develops a serious passion for her physician, who is still free; that she is ready to seek divorce in order to belong to him, or even does not hesitate to enter into a secret love affair, in case the conventional obstacles loom too large. Similar things are known to occur outside of psychoanalysis. Under these circumstances, however, we are surprised to hear women and girls make remarks that reveal a certain attitude toward the problems of the cure. They always knew that love alone could cure them, and from the very beginning of their treatment they anticipated that this relationship would yield them what life had denied. This hope alone has spurred them on to exert themselves

during the treatments, to overcome all the difficulties in communicating their disclosures. We add on our own account— "and to understand so easily everything that is generally most difficult to believe." But we are amazed by such a confession; it upsets our calculations completely. Can it be that we have omitted the most important factor from our hypothesis?

And really, the more experience we gain, the less we can deny this correction, which shames our knowledge. The first few times we could still believe that the analytic cure had met with an accidental interruption, not inherent to its purpose. But when this affectionate relation between physician and patient occurs regularly in every new case, under the most unfavorable conditions and even under grotesque circumstances; when it occurs in the case of the elderly woman, and is directed toward the grey-beard, or to one in whom, according to our judgment, no seductive attractions exist, we must abandon the idea of an accidental interruption, and realize that we are dealing with a phenomenon which is closely interwoven with the nature of the illness.

The new fact which we recognize unwillingly is termed *transference*. We mean a transference of emotions to the person of the physician, because we do not believe that the situation of the cure justifies the genesis of such feelings. We rather surmise that this readiness toward emotion originated elsewhere, that it was prepared within the patient, and that the opportunity given by analytic treatment caused it to be transferred to the person of the physician. Transference may occur as a stormy demand for love or in a more moderate form; in place of the desire to be his mistress, the young girl may wish to be adopted as the favored daughter of the old man, the libidinous desire may be toned down to a proposal of inseparable but ideal and platonic friendship. Some women understand how to sublimate the transference, how to modify it until it attains a kind of fitness for existence; others manifest it in its original, crude and generally impossible form. But fundamentally it is always the same and can never conceal that its origin is derived from the same source.

Before we ask ourselves how we can accommodate this new fact, we must first complete its description. What happens in the case of male patients? Here we might hope to escape the troublesome infusion of sex difference and sex attraction. But the answer is pretty much the same as with women patients. The same relation to the physician, the same over-

estimation of his qualities, the same abandon of interest toward his affairs, the same jealousy toward all those who are close to him. The sublimated forms of transference are more frequent in men, the direct sexual demand is rarer to the extent to which manifest homosexuality retreats before the methods by which these instinct components may be utilized. In his male patients more often than in his women patients, the physician observes a manifestation of transference which at first sight seems to contradict everything previously described: a hostile or *negative* transference.

In the first place, let us realize that the transference occurs in the patient at the very outset of the treatment and is, for a time, the strongest impetus to work. We do not feel it and need not heed it as long as it acts to the advantage of the analysis we are working out together. When it turns into resistance, however, we must pay attention to it. Then we discover that two contrasting conditions have changed their relation to the treatment. In the first place there is the development of an affectionate inclination, clearly revealing the signs of its origin in sexual desire which becomes so strong as to awaken an inner resistance against it. Secondly, there are the hostile instead of the tender impulses. The hostile feelings generally appear later than the affectionate impulses or succeed them. When they occur simultaneously they exemplify the ambivalence of emotions which exists in most of the intimate relations between all persons. The hostile feelings connote an emotional attachment just as do the affectionate impulses, just as defiance signifies dependence as well as does obedience, although the activities they call out are opposed. We cannot doubt but that the hostile feelings toward the physician deserve the name of transference, since the situation which the treatment creates certainly could not give sufficient cause for their origin. This necessary interpretation of negative transference assures us that we have not mistaken the positive or affectionate emotions that we have similarly named.

The origin of this transference, the difficulties it causes us, the means of overcoming it, the use we finally extract from it — these matters must be dealt with in the technical instruction of psychoanalysis, and can only be touched upon here. It is out of the question to yield to those demands of the patient which take root from the transference, while it would be unkind to reject them brusquely or even indignantly. We overcome transference by proving to the patient that his feelings do not originate in the present

situation, and are not intended for the person of the physician, but merely repeat what happened to him at some former time. In this way we force him to transform his repetition into a recollection. And so transference, which whether it be hostile or affectionate, seems in every case to be the greatest menace of the cure, really becomes its most effectual tool, which aids in opening the locked compartments of the psychic life. But I should like to tell you something which will help you to overcome the astonishment you must feel at this unexpected phenomenon. We must not forget that this illness of the patient which we have undertaken to analyze is not consummated or, as it were, congealed; rather it is something that continues its development like a living being. The beginning of the treatment does not end this development. When the cure, however, first has taken possession of the patient, the productivity of the illness in this new phase is concentrated entirely on one aspect: the relation of the patient to the physician. And so transference may be compared to the cambrium layer between the wood and the bark of a tree, from which the formation of new tissues and the growth of the trunk proceed at the same time. When the transference has once attained this significance the work upon the recollections of the patient recedes into the background. At that point it is correct to say that we are no longer concerned with the patient's former illness, but with a newly created, transformed neurosis, in place of the former. We followed up this new edition of an old condition from the very beginning, we saw it originate and grow; hence we understand it especially well, because we ourselves are the center of it, its object. All the symptoms of the patient have lost their original meaning and have adapted themselves to a new meaning, which is determined by its relation to transference. Or, only such symptoms as are capable of this transformation have persisted. The control of this new, artificial neurosis coincides with the removal of the illness for which treatment was sought in the first place, namely, with the solution of our therapeutic problem. The human being who, by means of his relations to the physician, has freed himself from the influences of suppressed impulses, becomes and stays free in his individual life, when the influence of the physician is subsequently removed.

Transference has attained extraordinary significance, has become the centre of the cure, in the conditions of hysteria, anxiety and compulsion neuroses. Their conditions therefore are properly included under the term

transference neuroses. Whoever in his analytic experience has come into contact with the existence of transference can no longer doubt the character of those suppressed impulses that express themselves in the symptoms of these neuroses and requires no stronger proof of their libidinous character. We may say that our conviction that the meaning of the symptoms is substituted libidinous gratification was finally confirmed by this explanation of transference.

Now we have every reason to correct our former dynamic conception of the healing process, and to bring it into harmony with our new discernment. If the patient is to fight the normal conflict that our analysis has revealed against the suppressions, he requires a tremendous impetus to influence the desirable decision which will lead him back to health. Otherwise he might decide for a repetition of the former issue and allow those factors which have been admitted to consciousness to slip back again into suppression. The deciding vote in this conflict is not given by his intellectual penetration — which is neither strong nor free enough for such an achievement — but only by his relation to the physician. Inasmuch as his transference carries a positive sign, it invests the physician with authority and is converted into faith for his communications and conceptions. Without transference of this sort, or without a negative transfer, he would not even listen to the physician and to his arguments. Faith repeats the history of its own origin; it is a derivative of love and at first requires no arguments. When they are offered by a beloved person, arguments may later be admitted and subjected to critical reflection. Arguments without such support avail nothing, and never mean anything in life to most persons. Man’s intellect is accessible only in so far as he is capable of libidinous occupation with an object, and accordingly we have good ground to recognize and to fear the limit of the patient’s capacity for being influenced by even the best analytical technique, namely, the extent of his narcism.

The capacity for directing libidinous occupation with objects towards persons as well must also be accorded to all normal persons. The inclination to transference on the part of the neurotic we have mentioned, is only an extraordinary heightening of this common characteristic. It would be strange indeed if a human trait so wide-spread and significant had never been noticed and turned to account. But that has been done. Bernheim, with unerring perspicacity, based his theory of hypnotic

manifestations on the statement that all persons are open to suggestion in some way or other. Suggestibility in his sense is nothing more than an inclination to transference, bounded so narrowly that there is no room for any negative transfer. But Bernheim could never define suggestion or its origin. For him it was a fundamental fact, and he could never tell us anything regarding its origin. He did not recognize the dependence of suggestibility upon sexuality and the activity of the libido. We, on the other hand, must realize that we have excluded hypnosis from our technique of neurosis only to rediscover suggestion in the shape of transference.

But now I shall pause and let you put in a word. I see that an objection is looming so large within you that if it were not voiced you would be unable to listen to me. “So at last you confess that like the hypnotists, you work with the aid of suggestion. That is what we have been thinking for a long time. But why choose the detour over reminiscences of the past, revealing of the unconscious, interpretation and retranslation of distortions, the tremendous expenditure of time and money, if the only efficacious thing is suggestion? Why do you not use suggestion directly against symptoms, as the others do, the honest hypnotists? And if, furthermore, you offer the excuse that by going your way you have made numerous psychological discoveries which are not revealed by direct suggestion, who shall vouch for their accuracy? Are not they, too, a result of suggestion, that is to say, of unintentional suggestion? Can you not, in this realm also, thrust upon the patient whatever you wish and whatever you think is so?”

Your objections are uncommonly interesting, and must be answered. But I cannot do it now for lack of time. Till the next time, then. You shall see, I shall be accountable to you. Today I shall only end what I have begun. I promised to explain, with the aid of the factor of transference, why our therapeutic efforts have not met with success in narcistic neuroses.

This I can do in a few words and you will see how simply the riddle can be solved, how well everything harmonizes. Observation shows that persons suffering from narcistic neuroses have no capacity for transference, or only insufficient remains of it. They reject the physician not with hostility, but with indifference. That is why he cannot influence them. His words leave them cold, make no impression, and so the

mechanism of the healing process, which we are able to set in motion elsewhere, the renewal of the pathogenic conflict and the overcoming of the resistance to the suppression, cannot be reproduced in them. They remain as they are. Frequently they are known to attempt a cure on their own account, and pathological results have ensued. We are powerless before them.

On the basis of our clinical impressions of these patients, we asserted that in their case libidinous occupation with objects must have been abandoned, and object-libido must have been transformed into ego-libido. On the strength of this characteristic we had separated it from the first group of neurotics (hysteria, anxiety and compulsion neuroses). Their behavior under attempts at therapy confirms this supposition. They show no neurosis. They, therefore, are inaccessible to our efforts and we cannot cure them.

TWENTY-EIGHTH LECTURE. GENERAL THEORY OF THE NEUROSES

Analytical Therapy

YOU know our subject for today. You asked me why we do not make use of direct suggestion in psychoanalytic therapy, when we admit that our influence depends substantially upon transference, i.e., suggestion, for you have come to doubt whether or not we can answer for the objectivity of our psychological discoveries in the face of such a predominance of suggestion. I promised to give you a comprehensive answer.

Direct suggestion is suggestion directed against the expression of the symptoms, a struggle between your authority and the motives of the disease. You pay no attention during this process to the motives, but only demand of the patient that he suppress their expression in symptoms. So it makes no difference in principle whether you hypnotize the patient or not. Bernheim, with his usual perspicacity, asserted that suggestion is the essential phenomenon underlying hypnotism, that hypnotism itself is already a result of suggestion, is a suggested condition. Bernheim was especially fond of practising suggestion upon a person in the waking state, and could achieve the same results as with suggestion under hypnosis.

What shall I deal with first, the evidence of experience or theoretic considerations?

Let us begin with our experiences. I was a pupil of Bernheim’s, whom I sought out in Nancy in 1889, and whose book on suggestion I translated into German. For years I practised hypnotic treatment, at first by means of prohibitory suggestions alone, and later by this method in combination with investigation of the patient after the manner of Breuer. So I can speak from experience about the results of hypnotic or suggestive therapy. If we judge Bernheim’s method according to the old doctor’s password that an ideal therapy must be rapid, reliable and not unpleasant for the patient, we find it fulfills at least two of these requirements. It can be carried out much more rapidly, indescribably more rapidly than the analytic method, and it brings the patient neither trouble nor discomfort. In the long run it becomes monotonous for the physician, since each case is exactly the same; continually forbidding the existence of the most diverse symptoms under the same ceremonial, without being able to grasp anything of their

meaning or their significance. It is second-rate work, not scientific activity, and reminiscent of magic, conjuring and hocus-pocus; yet in the face of the interest of the patient this cannot be considered. The third requisite, however, was lacking. The procedure was in no way reliable. It might succeed in one case, and fail with the next; sometimes much was accomplished, at other times little, one knew not why. Worse than this capriciousness of the technique was the lack of permanency of the results. After a short time, when the patient was again heard from, the old malady had reappeared, or it had been replaced by a new malady. We could start in again to hypnotize. At the same time we had been warned by those who were experienced that by frequent repetitions of hypnotism we would deprive the patient of his self-reliance and accustom him to this therapy as though it were a narcotic. Granted that we did occasionally succeed as well as one could wish; with slight trouble we achieved complete and permanent results. But the conditions for such a favorable outcome remained unknown. I have had it happen that an aggravated condition which I had succeeded in clearing up completely by a short hypnotic treatment returned unchanged when the patient became angry and arbitrarily developed ill feeling against me. After a reconciliation I was able to remove the malady anew and with even greater thoroughness, yet when she became hostile to me a second time it returned again. Another time a patient whom I had repeatedly helped through nervous conditions by hypnosis, during the treatment of an especially stubborn attack, suddenly threw her arms around my neck. This made it necessary to consider the question, whether one wanted to or not, of the nature and source of the suggestive authority.

So much for experience. It shows us that in renouncing direct suggestion we have given up nothing that is not replaceable. Now let us add a few further considerations. The practice of hypnotic therapy demands only a slight amount of work of the patient as well as of the physician. This therapy fits in perfectly with the estimation of neuroses to which the majority of physicians subscribe. The physician says to the neurotic, “There is nothing the matter with you; you are only nervous, and so I can blow away all your difficulties with a few words in a few minutes.” But it is contrary to our dynamic conceptions that we should be able to move a great weight by an inconsiderable force, by attacking it directly and without the aid of appropriate preparations. So far as

conditions are comparable, experience shows us that this performance does not succeed with the neurotic. But I know this argument is not unassailable; there are also “redeeming features.”

In the light of the knowledge we have gained from psychoanalysis we can describe the difference between hypnotic and psychoanalytic suggestion as follows: Hypnotic therapy seeks to hide something in psychic life, and to gloss it over; analytic therapy seeks to lay it bare and to remove it. The first method works cosmetically, the other surgically. The first uses suggestion in order to prevent the appearance of the symptoms, it strengthens suppression, but leaves unchanged all other processes that have led to symptom development. Analytic therapy attacks the illness closer to its sources, namely in the conflicts out of which the symptoms have emerged, it makes use of suggestion to change the solution of these conflicts. Hypnotic therapy leaves the patient inactive and unchanged, and therefore without resistance to every new occasion for disease. Analytic treatment places upon the physician, as well as upon the patient, a difficult responsibility; the inner resistance of the patient must be abolished. The psychic life of the patient is permanently changed by overcoming these resistances, it is lifted upon a higher plane of development and remains protected against new possibilities of disease. The work of overcoming resistance is the fundamental task of the analytic cure. The patient, however, must take it on himself to accomplish this, while the physician, with the aid of suggestion, makes it possible for him to do so. The suggestion works in the nature of an *education*. We are therefore justified in saying that analytic treatment is a sort of *after-education*.

I hope I have made it clear to you wherein our technique of using suggestion differs therapeutically from the only use possible in hypnotic therapy. With your knowledge of the relation between suggestion and transference you will readily understand the capriciousness of hypnotic therapy which attracted our attention, and you will see why, on the other hand, analytic suggestion can be relied upon to its limits. In hypnosis we depend on the condition of the patient’s capacity for transference, yet we are unable to exert any influence on this capacity. The transference of the subject may be negative, or, as is most frequent, ambivalent; the patient may have protected himself against suggestion by very special adjustments, yet we are unable to learn anything concerning them. In

psychoanalysis we work with the transference itself, we do away with the forces opposing it, prepare the instrument with which we are to work. So it becomes possible to derive entirely new uses from the power of suggestion; we are able to control it, the patient does not work himself into any state of mind he pleases, but in so far as we are able to influence him at all, we can guide the suggestion.

Now you will say, regardless of whether we call the driving force of our analysis transference or suggestion, there is still the danger that through our influence on the patient the objective certainty of our discoveries becomes doubtful. That which becomes a benefit to therapy works harm to the investigation. This objection is most often raised against psychoanalysis, and it must be admitted that even if it does not hit the mark, it cannot be waved aside as stupid. But if it were justified, psychoanalysis would be nothing more than an extraordinarily well disguised and especially workable kind of treatment by suggestion, and we may lay little weight upon all its assertions concerning the influences of life, psychic dynamics, and the unconscious. This is in fact the opinion held by our opponents; we are supposed especially to have “balked into” the patients everything that supports the importance of sexual experiences, and often the experiences themselves, after the combinations themselves have grown up in our degenerate imaginations. We can refute these attacks most easily by calling on the evidence of experience rather than by resorting to theory. Anyone who has himself performed a psychoanalysis has been able to convince himself innumerable times that it is impossible thus to suggest anything to the patient. There is no difficulty, of course, in making the patient a disciple of any one theory, and thus causing him to share the possible error of the physician. With respect to this he behaves just like any other person, like a student, but he has influenced only his intelligence, not his disease. The solving of his conflicts and the overcoming of his resistances succeeds only if we have aroused in him representations of such expectations as can agree with reality. What was inapplicable in the assumptions of the physician falls away during the course of the analysis; it must be withdrawn and replaced by something more nearly correct. By employing a careful technique we seek to prevent the occurrence of temporary results arising out of suggestion, yet there is no harm if such temporary results occur, for we are never satisfied with early successes. We do not consider the analysis finished until all the

obscurities of the case are cleared up, all amnestic gaps filled out and the occasions which originally called out the suppressions discovered. We see in results that are achieved too quickly a hindrance rather than a furtherance of analytic work and repeatedly we undo these results again by purposely breaking up the transference upon which they rest. Fundamentally it is this feature which distinguishes analytical treatment from the purely suggestive technique and frees analytic results from the suspicion of having been suggested. Under every other suggestive treatment the transference itself is most carefully upheld and the influence left unquestioned; in analytic treatment, however, the transference becomes the subject of treatment and is subject to criticism in whatever form it may appear. At the end of an analytic cure the transference itself must be abolished; therefore the effect of the treatment, whether positive or negative, must be founded not upon suggestion but upon the overcoming of inner resistances, upon the inner change achieved in the patient, which the aid of suggestion has made possible.

Presumably the creation of the separate suggestions is counteracted, in the course of the cure, by our being continually forced to attack resistances which have the ability to change themselves into negative (hostile) transferences. Furthermore, let me call your attention to the fact that a large number of results of analysis, otherwise perhaps subject to the suspicion that they are products of suggestion, can be confirmed from other unquestionable sources. As authoritative witnesses in this case we refer to the testimony of dements and paranoiacs, who are, naturally far removed from any suspicion of suggestive influence. Whatever these patients can tell us about symbolic translations and phantasies which have forced their way into their consciousness agrees faithfully with the results of our investigations upon the unconscious of transference-neurotics, and this gives added weight to the objective correctness of our interpretations which are so often doubted. I believe you will not go wrong if you give your confidence to analysis with reference to these factors.

We now want to complete our statement concerning the mechanism of healing, by including it within the formulae of the libido theory. The neurotic is incapable both of enjoyment and work; first, because his libido is not directed toward any real object, and second because he must use up a great deal of his former energy to keep his libido suppressed and to arm himself against its attacks. He would become well if there could be an end

to the conflict between his ego and his libido, and if his ego could again have the libido at its disposal. The task of therapy, therefore, consists of freeing the libido from its present bonds, which have estranged it from the ego, and furthermore to bring it once more into the service of the ego. Where is the libido of the neurotics? It is easy to find; it is bound to the symptoms which at that time furnish it with the only available substitute satisfaction. We have to become master of the symptoms, and abolish them, which is of course exactly what the patient asks us to do. To abolish the symptoms it becomes necessary to go back to their origin, to renew the conflict out of which they emerged, but this time with the help of motive forces that were originally not available, to guide it toward a new solution. This revision of the process of suppression can be accomplished only in part by following the traces in memory of the occurrences which led to the suppression. The decisive part of the cure is accomplished by means of the relationship to the physician, the transference, by means of which new editions of the old conflict are created. Under this situation the patient would like to behave as he had behaved originally, but by summoning all his available psychic power we compel him to reach a different decision. Transference, then, becomes the battlefield on which all the contending forces are to meet.

The full strength of the libido, as well as the entire resistance against it, is concentrated in this relationship to the physician; so it is inevitable that the symptoms of the libido should be laid bare. In place of his original disturbance the patient manifests the artificially constructed disturbance of transference; in place of heterogeneous unreal objects for the libido you now have only the person of the physician, a single object, which, however, is also fantastic. The new struggle over this object is, however, raised to the highest psychic level with the aid of the physician’s suggestions, and proceeds as a normal psychic conflict. By avoiding a new suppression the estrangement between the ego and the libido comes to an end, the psychic unity of the personality is restored. When the libido again becomes detached from the temporary object of the physician it cannot return to its former objects, but is now at the disposal of the ego. The forces we have overcome in the task of therapy are on the one hand the aversion of the ego for certain directions of the libido, which had expressed itself as a tendency to suppression, and on the other hand the

tenacity of the libido, which is loathe to leave an object which it has once occupied.

Accordingly the work of therapy falls into two phases: first, all the libido is forced from the symptoms into the transference, and concentrated there; secondly, the struggle over this new object is carried on and the libido set free. The decisive change for the better in this renewed conflict is the throwing out of the suppression, so that the libido cannot this time again escape the ego by fleeing into the unconscious. This is accomplished by the change in the ego under the influence of the physician's suggestion. In the course of the work of interpretation, which translates unconscious into conscious, the ego grows at the expense of the unconscious; it learns forgiveness toward the libido, and becomes inclined to permit some sort of satisfaction for it. The ego's timidity in the face of the demands of the libido is now lessened by the prospect of occupying some of the libido through sublimation. The more the processes of the treatment correspond to this theoretic description the greater will be the success of psychoanalytic therapy. It is limited by the lack of mobility of the libido, which can stand in the way of releasing its objects, and by the obstinate narcism which will not permit the object-transference to effect more than just so much. Perhaps we shall obtain further light on the dynamics of the healing process by the remark that we are able to gather up the entire libido which has become withdrawn from the control of the ego by drawing a part of it to ourselves in the process of transference.

It is to be remembered that we cannot reach a direct conclusion as to the disposition of the libido during the disease from the distributions of the libido which are effected during and because of the treatment. Assuming that we have succeeded in curing the case by means of the creation and destruction of a strong father-transference to the physician, it would be wrong to conclude that the patient had previously suffered from a similar and unconscious attachment of his libido to his father. The father-transference is merely the battlefield upon which we were able to overcome the libido; the patient's libido had been concentrated here from its other positions. The battlefield need not necessarily have coincided with the most important fortresses of the enemy. Defense of the hostile capital need not take place before its very gates. Not until we have again destroyed the transference can we begin to reconstruct the distribution of the libido that existed during the illness.

From the standpoint of the libido theory we might say a last word in regard to the dream. The dreams of neurotics, as well as their errors and haphazard thoughts, help us in finding the meaning of the symptoms and in discovering the disposition of the libido. In the form of the wish fulfillment they show us what wish impulses have been suppressed, and to what objects the libido, withdrawn from the ego, has been attached. That is why interpretation of dreams plays a large role in psychoanalytic treatment, and is in many cases, for a long time, the most important means with which we work. We already know that the condition of sleep itself carries with it a certain abatement of suppressions. Because of this lessening of the pressure upon it, it becomes possible for the suppressed impulse to create in the dream a much clearer expression than the symptom can furnish during the day. So dream-study is the easiest approach to a knowledge of the libidinous suppressed unconscious which has been withdrawn from the ego.

Dreams of neurotics differ in no essential point from the dreams of normal persons; you might even say they cannot be distinguished. It would be unreasonable to explain the dreams of the nervous in any way which could not be applied to the dreams of the normal. So we must say the difference between neurosis and health applies only during the day, and does not continue in dream life. We find it necessary to attribute to the healthy numerous assumptions which have grown out of the connections between the dreams and the symptoms of the neurotic. We are not in a position to deny that even a healthy man possesses those factors in his psychic life which alone make possible the development of the dream and of the symptom as well. We must conclude, therefore, that the healthy have also made use of suppressions and are put to a certain amount of trouble to keep those impulses under control; the system of their unconscious, too, conceals impulses which are suppressed, yet are still possessed of energy, and *a part of their libido is also withdrawn from the control of their ego*. So the healthy man is virtually a neurotic, but dreams are apparently the only symptoms which he can manifest. Yet if we subject our waking hours to a more penetrating analysis we discover, of course, that they refute this appearance and that this seemingly healthy life is shot through with a number of trivial, practically unimportant symptom formations.

The difference between nervous health and neurosis is entirely a practical one which is determined by the available capacity for enjoyment and accomplishment retained by the individual. It varies presumably with the relative proportion of the energy totals which have remained free and those which have been bound by suppressions, and is quantitative rather than qualitative. I do not have to remind you that this conception is the theoretical basis for the certainty that neuroses can be cured, despite their foundation in constitutional disposition.

This is accordingly what we may make out of the identity between the dreams of the healthy and those of the neurotic for the definition of health. As regards the dream itself, we must note further that we cannot separate it from its relation to neurotic symptoms. We must recognize that it is not completely defined as a translation of thoughts into an archaic form of expression, that is, we must assume it discloses a disposition of libido and of object-occupations which have actually taken place.

We have about come to the end. Perhaps you are disappointed that I have dealt only with theory in this chapter on psychoanalytic therapy, and have said nothing concerning the conditions under which the cure is undertaken, or of the successes which it achieves. But I shall omit both. I shall omit the first because I had intended no practical training in the practice of psychoanalysis, and I shall neglect the second for numerous reasons. At the beginning of our talks I emphasized the fact that under favorable circumstances we attain results which can be favorably compared with the happiest achievements in the field of internal therapy, and, I may add, these results could not have been otherwise achieved. If I were to say more I might be suspected of wishing to drown the voices of disparagement, which have become so loud, by advertising our claims. We psychoanalysts have repeatedly been threatened by our medical colleagues, even in open congresses, that the eyes of the suffering public must be opened to the worthlessness of this method of treatment by a statistical collection of analytic failures and injuries. But such a collection, aside from the biased, denunciatory character of its purpose, would hardly be able to give a correct picture of the therapeutic values of analysis. Analytic therapy is, as you know, still young; it took a long time to establish the technique, and this could be done only during the course of the work and under the influence of accumulating experience. As a result of the difficulties of instruction the physician who begins the practice of

psychoanalysis is more dependent upon his capacity to develop on his own account than is the ordinary specialist, and the results he achieves in his first years can never be taken as indicative of the possibilities of analytic therapy.

Many attempts at treatment failed in the early years of analysis because they were made on cases that were not at all suited to the procedure, and which today we exclude by our classification of symptoms. But this classification could be made only after practice. In the beginning we did not know that paranoia and dementia praecox are, in their fully developed phases, inaccessible, and we were justified in trying out our method on all kinds of conditions. Besides, the greatest number of failures in those first years were not due to the fault of the physician or because of unsuitable choice of subjects, but rather to the unpropitiousness of external conditions. We have hitherto spoken only of internal resistances, those of the patient, which are necessary and may be overcome. External resistances to psychoanalysis, due to the circumstances of the patient and his environment, have little theoretical interest, but are of great practical importance. Psychoanalytic treatment may be compared to a surgical operation, and has the right to be undertaken under circumstances favorable to its success. You know what precautions the surgeon is accustomed to take: a suitable room, good light, assistance, exclusion of relatives, etc. How many operations would be successful, do you think, if they had to be performed in the presence of all the members of the family, who would put their fingers into the field of operation and cry aloud at every cut of the knife? The interference of relatives in psychoanalytical treatment is a very great danger, a danger one does not know how to meet. We are armed against the internal resistances of the patient which we recognize as necessary, but how are we to protect ourselves against external resistance? It is impossible to approach the relatives of the patient with any sort of explanation, one cannot influence them to hold aloof from the whole affair, and one cannot get into league with them because we then run the danger of losing the confidence of the patient, who rightly demands that we in whom he confides take his part. Besides, those who know the rifts that are often formed in family life will not be surprised as analysts when they discover that the patient’s nearest relatives are less interested in seeing him cured than in having him remain as he is. Where, as is so often the case, the neurosis is connected with conflicts with

members of the family, the healthy member does not hesitate long in the choice between his own interest and that of the cure of the patient. It is not surprising if a husband looks with disfavor upon a treatment in which, as he may correctly suspect, the register of his sins is unrolled; nor are we surprised, and surely we cannot take the blame, when our efforts remain fruitless and are prematurely broken off because the resistance of the husband is added to that of the sick wife. We had only undertaken something which, under the existing circumstance, it was impossible to carry out.

Instead of many cases, I shall tell you of just one in which, because of professional precautions, I was destined to play a sad role. Many years ago I treated a young girl who for a long time was afraid to go on the street, or to remain at home alone. The patient hesitatingly admitted that her phantasy had been caused by accidentally observing affectionate relations between her mother and a well-to-do friend of the family. But she was so clumsy — or perhaps so sly — as to give her mother a hint of what had been discussed during the analysis, and changed her behavior toward her mother, insisting that no one but her mother should protect her against the fear of being alone, and anxiously barring the way when her mother wished to leave the house. The mother had previously been very nervous herself, but had been cured years before in a hydropathic sanatorium. Let us say, in that institution she made the acquaintance of the man with whom she was to enter upon the relationship which was able to satisfy her in every respect. Becoming suspicious of the stormy demands of the girl, the mother *suddenly* realized the meaning of her daughter’s fear. She must have made herself sick to imprison her mother and to rob her of the freedom she needed to maintain relations with her lover. Immediately the mother made an end to the harmful treatment. The girl was put into a sanatorium for the nervous and exhibited for many years as “a poor victim of psychoanalysis.” For just as long a period I was pursued by evil slander, due to the unfavorable outcome of this case. I maintained silence because I thought myself bound by the rules of professional discretion. Years later I learned from a colleague who had visited the institution, and had seen the agoraphobic girl there, that the relationship between the mother and the wealthy friend of the family was known all over town, and apparently connived at by the husband and father. It was to this “secret” that our treatment had been sacrificed.

In the years before the war, when the influx of patients from all parts made me independent of the favor or disfavor of my native city, I followed the rule of not treating anyone who was not *sui juris,* was not independent of all other persons in his essential relations of life. Every psychoanalyst cannot do this. You may conclude from my warning against the relatives of patients that for purposes of psychoanalysis we should take the patients away from their families, and should limit this therapy to the inmates of sanatoriums. I should not agree with you in this; it is much more beneficial for the patients, if they are not in a stage of great exhaustion, to continue in the same circumstances under which they must master the tasks set for them during the treatment. But the relatives ought not to counteract this advantage by their behavior, and above all, they should not antagonize and oppose the endeavors of the physician. But how are we to contend against these influences which are so inaccessible to us! You see how much the prospects of a treatment are determined by the social surroundings and the cultural conditions of a family.

This offers a sad outlook indeed for the effectiveness of psychoanalysis as a therapy, even if we can explain the great majority of our failures by putting the blame on such disturbing external factors! Friends of analysis have advised us to counterbalance such a collection of failures by means of a statistical compilation on our part of our successful cases. Yet I could not try myself to do this. I tried to explain that statistics would be worthless if the collected cases were not comparable, and in fact, the various neuroses which we have undertaken to treat could, as a matter of fact, hardly be compared on the same basis, since they differed in many fundamental respects. Besides, the period of time over which we could report was too short to permit us to judge the permanency of our cures, and concerning certain cases we could not have given any information whatever. They related to persons who had kept their ailments, as well as their treatment, secret, and whose cure must necessarily be kept secret as well. The strongest hindrance, however, lay in the knowledge that men behave most irrationally in matters of therapy, and that we have no prospect of attaining anything by an appeal to reason. A therapeutic novelty is received either with frenzied enthusiasm, as was the case when Koch first made public his tuberculin against tuberculosis, or it is treated with abysmal distrust, as was the really blessed vaccination of Jenner, which even today retains implacable opponents. There was a very obvious

prejudice against psychoanalysis. When we had cured a very difficult case we would hear it said: “That is no proof, he would have become well by himself in all this time.” Yet when a patient who had already gone through four cycles of depression and mania came into my care during a temporary cessation in the melancholia, and three weeks later found herself in the beginnings of a new attack, all the members of the family as well as the high medical authorities called into consultation, were convinced that the new attack could only be the result of the attempted analysis. Against prejudice we are powerless; you see it again in the prejudices that one group of warring nations has developed against the other. The most sensible thing for us to do is to wait and allow time to wear it away. Some day the same persons think quite differently about the same things than before. Why they formerly thought otherwise remains the dark secret.

It may be possible that the prejudice against psychoanalysis is already on the wane. The continual spread of psychoanalytic doctrine, the increase of the number of physicians in many lands who treat analytically, seems to vouch for it. When I was a young physician I was caught in just such a storm of outraged feeling of the medical profession toward hypnosis, treatment by suggestion, which today is contrasted with psychoanalysis by “sober” men. Hypnotism did not, however, as a therapeutic agent, live up to its promises; we psychoanalysts may call ourselves its rightful heirs, and we have not forgotten the large amount of encouragement and theoretical explanation we owe to it. The injuries blamed upon psychoanalysis are limited essentially to temporary aggravation of the conflict when the analysis is clumsily handled, or when it is broken off unfinished. You have heard our justification for our form of treatment, and you can form your own opinion as to whether or not our endeavors are likely to lead to lasting injury. Misuse of psychoanalysis is possible in various ways; above all, transference is a dangerous remedy in the hands of an unconscientious physician. But no professional method of procedure is protected from misuse; a knife that is not sharp is of no use in effecting a cure.

I have thus reached the end, ladies and gentlemen. It is more than the customary formal speech when I admit that I am myself keenly depressed over the many faults in the lectures I have just delivered. First of all, I am sorry that I have so often promised to return to a subject only slightly touched upon at the time, and then found that the context has not made it

possible to keep my word. I have undertaken to inform you concerning an unfinished thing, still in the process of development, and my brief exposition itself was an incomplete thing. Often I presented the evidence and then did not myself draw the conclusion. But I could not endeavor to make you masters of the subject. I tried only to give you some explanation and stimulation.

THOUGHTS FOR THE TIMES ON WAR AND DEATH

Translated by Alfred B. Kuttner

CONTENTS

I. THE DISAPPOINTMENTS OF WAR
II. OUR ATTITUDE TOWARDS DEATH

I. THE DISAPPOINTMENTS OF WAR

CAUGHT in the whirlwind of these war times, without any real information or any perspective upon the great changes that have already occurred or are about to be enacted, lacking all premonition of the future, it is small wonder that we ourselves become confused as to the meaning of impressions which crowd in upon us or of the value of the judgments we are forming. It would seem as though no event had ever destroyed so much of the precious heritage of mankind, confused so many of the clearest intellects or so thoroughly debased what is highest.

Even science has lost her dispassionate impartiality. Her deeply embittered votaries are intent upon seizing her weapons to do their share in the battle against the enemy. The anthropologist has to declare his opponent inferior and degenerate, the psychiatrist must diagnose him as mentally deranged. Yet it is probable that we are affected out of all proportion by the evils of these times and have no right to compare them with the evils of other times through which we have not lived.

The individual who is not himself a combatant and therefore has not become a cog in the gigantic war machinery, feels confused in his bearings and hampered in his activities. I think any little suggestion that will make it easier for him to see his way more clearly will be welcome. Among the factors which cause the stay-at-home so much spiritual misery and are so hard to endure there are two in particular which I should like to emphasize and discuss. I mean the disappointment that this war has called forth and the altered attitude towards death to which it, in common with other wars, forces us.

When I speak of disappointment everybody knows at once what I mean. One need not be a sentimentalist, one may realize the biological and physiological necessity of suffering in the economy of human life, and yet one may condemn the methods and the aims of war and long for its termination. To be sure, we used to say that wars cannot cease as long as nations live under such varied conditions, as long as they place such different values upon the individual life, and as long as the animosities which divide them represent such powerful psychic forces. We were therefore quite ready to believe that for some time to come there would be wars between primitive and civilized nations and between those divided by

color, as well as with and among the partly enlightened and more or less civilized peoples of Europe. But we dared to hope differently. We expected that the great ruling nations of the white race, the leaders of mankind, who had cultivated world wide interests, and to whom we owe the technical progress in the control of nature as well as the creation of artistic and scientific cultural standards — we expected that these nations would find some other way of settling their differences and conflicting interests.

Each of these nations had set a high moral standard to which the individual had to conform if he wished to be a member of the civilized community.

These frequently over strict precepts demanded a great deal of him, a great self-restraint and a marked renunciation of his impulses. Above all he was forbidden to resort to lying and cheating, which are so extraordinarily useful in competition with others. The civilized state considered these moral standards the foundation of its existence, it drastically interfered if anyone dared to question them and often declared it improper even to submit them to the test of intellectual criticism. It was therefore assumed that the state itself would respect them and would do nothing that might contradict the foundations of its own existence. To be sure, one was aware that scattered among these civilized nations there were certain remnants of races that were quite universally disliked, and were therefore reluctantly and only to a certain extent permitted to participate in the common work of civilization where they had proved themselves sufficiently fit for the task. But the great nations themselves, one should have thought, had acquired sufficient understanding for the qualities they had in common and enough tolerance for their differences so that, unlike in the days of classical antiquity, the words “foreign” and “hostile” should no longer be synonyms.

Trusting to this unity of civilized races countless people left hearth and home to live in strange lands and trusted their fortunes to the friendly relations existing between the various countries. And even he who was not tied down to the same spot by the exigencies of life could combine all the advantages and charms of civilized countries into a newer and greater fatherland which he could enjoy without hindrance or suspicion. He thus took delight in the blue and the grey ocean, the beauty of snow clad mountains and of the green lowlands, the magic of the north woods and the grandeur of southern vegetation, the atmosphere of landscapes upon which

great historical memories rest, and the peace of untouched nature. The new fatherland was to him also a museum, filled with the treasure that all the artists of the world for many centuries had created and left behind. While he wandered from one hall to another in this museum he could give his impartial appreciation to the varied types of perfection that had been developed among his distant compatriots by the mixture of blood, by history, and by the peculiarities of physical environment. Here cool, inflexible energy was developed to the highest degree, there the graceful art of beautifying life, elsewhere the sense of law and order, or other qualities that have made man master of the earth.

We must not forget that every civilized citizen of the world had created his own special “Parnassus” and his own “School of Athens.” Among the great philosophers, poets, and artists of all nations he had selected those to whom he considered himself indebted for the best enjoyment and understanding of life, and he associated them in his homage both with the immortal ancients and with the familiar masters of his own tongue. Not one of these great figures seemed alien to him just because he spoke in a different language; be it the incomparable explorer of human passions or the intoxicated worshiper of beauty, the mighty and threatening seer or the sensitive scoffer, and yet he never reproached himself with having become an apostate to his own nation and his beloved mother tongue.

The enjoyment of this common civilization was occasionally disturbed by voices which warned that in consequence of traditional differences wars were unavoidable even between those who shared this civilization. One did not want to believe this, but what did one imagine such a war to be like if it should ever come about? No doubt it was to be an opportunity to show the progress in man’s community feeling since the days when the Greek amphictyonies had forbidden the destruction of a city belonging to the league, the felling of her oil trees and the cutting off of her water supply. It would be a chivalrous bout of arms for the sole purpose of establishing the superiority of one side or the other with the greatest possible avoidance of severe suffering which could contribute nothing to the decision, with complete protection for the wounded, who must withdraw from the battle, and for the physicians and nurses who devote themselves to their care. With every consideration, of course, for noncombatants, for the women who are removed from the activities of war, and for the children who, when grown up, are to become friends and co-workers on both sides. And

with the maintenance, finally, of all the international projects and institutions in which the civilized community of peace times had expressed its corporate life.

Such a war would still be horrible enough and full of burdens, but it would not have interrupted the development of ethical relations between the large human units, between nations and states. But the war in which we did not want to believe broke out and brought — disappointment. It is not only bloodier and more destructive than any foregoing war, as a result of the tremendous development of weapons of attack and defense, but it is at least as cruel, bitter, and merciless as any earlier war. It places itself above all the restrictions pledged in times of peace, the so-called rights of nations, it does not acknowledge the prerogatives of the wounded and of physicians, the distinction between peaceful and fighting members of the population, or the claims of private property. It hurls down in blind rage whatever bars its way, as though there were to be no future and no peace after it is over. It tears asunder all community bonds among the struggling peoples and threatens to leave a bitterness which will make impossible any re-establishment of these ties for a long time to come.

It has also brought to light the barely conceivable phenomenon of civilized nations knowing and understanding each other so little that one can turn from the other with hate and loathing. Indeed one of these great civilized nations has become so universally disliked that it is even attempted to cast it out from the civilized community as though it were barbaric, although this very nation has long proved its eligibility through contribution after contribution of brilliant achievements. We live in the hope that impartial history will furnish the proof that this very nation, in whose language I am writing and for whose victory our dear ones are fighting, has sinned least against the laws of human civilization. But who is privileged to step forward at such a time as judge in his own defense?

Races are roughly represented by the states they form and these states by the governments which guide them. The individual citizen can prove with dismay in this war what occasionally thrust itself upon him already in times of peace, namely, that the state forbids him to do wrong not because it wishes to do away with wrongdoing but because it wishes to monopolize it, like salt and tobacco. A state at war makes free use of every injustice, every act of violence, that would dishonor the individual. It employs not only permissible cunning but conscious lies and intentional deception

against the enemy, and this to a degree which apparently outdoes what was customary in previous wars. The state demands the utmost obedience and sacrifice of its citizens, but at the same time it treats them as children through an excess of secrecy and a censorship of news and expression of opinion which render the minds of those who are thus intellectually repressed defenseless against every unfavorable situation and every wild rumor. It absolves itself from guarantees and treaties by which it was bound to other states, makes unabashed confession of its greed and aspiration to power, which the individual is then supposed to sanction out of patriotism.

Let the reader not object that the state cannot abstain from the use of injustice because it would thereby put itself at a disadvantage. For the individual, too, obedience to moral standards and abstinence from brutal acts of violence are as a rule very disadvantageous, and the state but rarely proves itself capable of indemnifying the individual for the sacrifice it demands of him. Nor is it to be wondered at that the loosening of moral ties between the large human units has had a pronounced effect upon the morality of the individual, for our conscience is not the inexorable judge that teachers of ethics say it is; it has its origin in nothing but “social fear.” Wherever the community suspends its reproach the suppression of evil desire also ceases, and men commit acts of cruelty, treachery, deception, and brutality, the very possibility of which would have been considered incompatible with their level of culture.

Thus the civilized world-citizen of whom I spoke before may find himself helpless in a world that has grown strange to him when he sees his great fatherland disintegrated, the possessions common to mankind destroyed, and his fellow citizens divided and debased.

Nevertheless several things might be said in criticism of his disappointment. Strictly speaking it is not justified, for it consists in the destruction of an illusion. Illusions commend themselves to us because they save us pain and allow us to enjoy pleasure instead. We must therefore accept it without complaint when they sometimes collide with a bit of reality against which they are dashed to pieces.

Two things have roused our disappointment in this war: the feeble morality of states in their external relations which have inwardly acted as guardians of moral standards, and the brutal behavior of individuals of the

highest culture of whom one would not have believed any such thing possible.

Let us begin with the second point and try to sum up the view which we wish to criticise in a single compact statement. Through what process does the individual reach a higher stage of morality? The first answer will probably be: He is really good and noble from birth, in the first place. It is hardly necessary to give this any further consideration. The second answer will follow the suggestion that a process of development is involved here and will probably assume that this development consists in eradicating the evil inclinations of man and substituting good inclinations under the influence of education and cultural environment. In that case we may indeed wonder that evil should appear again so actively in persons who have been educated in this way.

But this answer also contains the theory which we wish to contradict. In reality there is no such thing as “eradicating” evil. Psychological, or strictly speaking, psychoanalytic investigation proves, on the contrary, that the deepest character of man consists of impulses of an elemental kind which are similar in all human beings, the aim of which is the gratification of certain primitive needs. These impulses are in themselves neither good or evil. We classify them and their manifestations according to their relation to the needs and demands of the human community. It is conceded that all the impulses which society rejects as evil, such as selfishness and cruelty, are of this primitive nature.

These primitive impulses go through a long process of development before they can become active in the adult. They become inhibited and diverted to other aims and fields, they unite with each other, change their objects and in part turn against one’s own person. The formation of reactions against certain impulses give the deceptive appearance of a change of content, as if egotism had become altruism and cruelty had changed into sympathy. The formation of these reactions is favored by the fact that many impulses appear almost from the beginning in contrasting pairs; this is a remarkable state of affairs called the ambivalence of feeling and is quite unknown to the layman. This feeling is best observed and grasped through the fact that intense love and intense hate occur so frequently in the same person. Psychoanalysis goes further and states that the two contrasting feelings not infrequently take the same person as their object.

What we call the character of a person does not really emerge until the fate of all these impulses has been settled, and character, as we all know, is very inadequately defined in terms of either “good” or “evil.” Man is seldom entirely good or evil, he is “good” on the whole in one respect and “evil” in another, or “good” under certain conditions, and decidedly “evil” under others. It is interesting to learn that the earlier infantile existence of intense “bad” impulses is often the necessary condition of being “good” in later life. The most pronounced childish egotists may become the most helpful and self-sacrificing citizens; the majority of idealists, humanitarians, and protectors of animals have developed from little sadists and animal tormentors.

The transformation of “evil” impulses is the result of two factors operating in the same sense, one inwardly and the other outwardly. The inner factor consists in influencing the evil or selfish impulses through erotic elements, the love needs of man interpreted in the widest sense. The addition of erotic components transforms selfish impulses into social impulses. We learn to value being loved as an advantage for the sake of which we can renounce other advantages. The outer factor is the force of education which represents the demands of the civilized environment and which is then continued through the direct influence of the cultural *milieu*.

Civilization is based upon the renunciation of impulse gratification and in turn demands the same renunciation of impulses from every newcomer. During the individual’s life a constant change takes place from outer to inner compulsion. The influences of civilization work through the erotic components to bring about the transformation of more and more of the selfish tendencies into altruistic and social tendencies. We may indeed assume that the inner compulsion which makes itself felt in the development of man was originally, that is, in the history of mankind, a purely external compulsion. Today people bring along a certain tendency (disposition) to transform the egotistic into social impulses as a part of their hereditary organization, which then responds to further slight incentives to complete the transformation. A part of this transformation of impulse must also be made during life. In this way the individual man is not only under the influence of his own contemporary cultural *milieu* but is also subject to the influences of his ancestral civilization.

If we call a person’s individual capacity for transforming his egotistical impulses under the influence of love his cultural adaptability, we can say

that this consists of two parts, one congenital and the other acquired, and we may add that the relation of these two to each other and to the untransformed part of the emotional life is a very variable one.

In general we are inclined to rate the congenital part too highly, and are also in danger of over-valuing the whole cultural adaptability in its relation to that part of the impulse life which has remained primitive, that is, we are misled into judging people to be “better” than they really are. For there is another factor which clouds our judgment and falsifies the result in favor of what we are judging.

We are of course in no position to observe the impulses of another person. We deduce them from his actions and his conduct, which we trace back to motives springing from his emotional life. In a number of cases such a conclusion is necessarily incorrect. The same actions which are “good” in the civilized sense may sometimes originate in “noble” motives and sometimes not. Students of the theory of ethics call only those acts “good” which are the expression of good impulses and refuse to acknowledge others as such. But society is on the whole guided by practical aims and does not bother about this distinction; it is satisfied if a man adapts his conduct and his actions to the precepts of civilization and asks little about his motives.

We have heard that the outer compulsion which education and environment exercise upon a man brings about a further transformation of his impulse life for the good, the change from egotism to altruism. But this is not the necessary or regular effect of the outer compulsion. Education and environment have not only love premiums to offer but work with profit premiums of another sort, namely rewards and punishments. They can therefore bring it about that a person subject to their influence decides in favor of good conduct in the civilized sense without any ennobling of impulse or change from egotistic into altruistic inclinations. On the whole the consequence remains the same; only special circumstances will reveal whether the one person is always good because his impulses compel him to be so while another person is good only in so far as this civilized behavior is of advantage to his selfish purposes. But our superficial knowledge of the individual gives us no means of distinguishing the two cases, and we shall certainly be misled by our optimism into greatly over-estimating the number of people who have been transformed by civilization.

Civilized society, which demands good conduct and does not bother about the impulse on which it is based, has thus won over a great many people to civilized obedience who do not thereby follow their own natures. Encouraged by this success, society has permitted itself to be misled into putting the ethical demands as high as possible, thereby forcing its members to move still further from their emotional dispositions. A continual emotional suppression is imposed upon them, the strain of which is indicated by the appearance of the most remarkable reactions and compensations.

In the field of sexuality, where such suppression is most difficult to carry out, it results in reactions known as neurotic ailments. In other fields the pressure of civilization shows no pathological results but manifests itself in distorted characters and in the constant readiness of the inhibited impulses to enforce their gratification at any fitting opportunity.

Anyone thus forced to react continually to precepts that are not the expressions of his impulses lives, psychologically speaking, above his means, and may be objectively described as a hypocrite, whether he is clearly conscious of this difference or not. It is undeniable that our contemporary civilization favors this sort of hypocrisy to an extraordinary extent. One might even venture to assert that it is built upon such a hypocrisy and would have to undergo extensive changes if man were to undertake to live according to the psychological truth. There are therefore more civilized hypocrites than truly cultured persons, and one can even discuss the question whether a certain amount of civilized hypocrisy is not indispensable to maintain civilization because the already organized cultural adaptability of the man of today would perhaps not suffice for the task of living according to the truth. On the other hand the maintenance of civilization even on such questionable grounds offers the prospect that with every new generation a more extensive transformation of impulses will pave the way for a better civilization.

These discussions have already afforded us the consolation that our mortification and painful disappointment on account of the uncivilized behavior of our fellow world citizens in this war were not justified. They rested upon an illusion to which we had succumbed. In reality they have not sunk as deeply as we feared because they never really rose as high as we had believed. The fact that states and races abolished their mutual ethical restrictions not unnaturally incited them to withdraw for a time

from the existing pressure of civilization and to sanction a passing gratification of their suppressed impulses. In doing so their relative morality within their own national life probably suffered no rupture.

But we can still further deepen our understanding of the change which this war has brought about in our former compatriots and at the same time take warning not to be unjust to them. For psychic evolution shows a peculiarity which is not found in any other process of development. When a town becomes a city or a child grows into a man, town and child disappear in the city and in the man. Only memory can sketch in the old features in the new picture; in reality the old materials and forms have been replaced by new ones. It is different in the case of psychic evolution. One can describe this unique state of affairs only by saying that every previous stage of development is preserved next to the following one from which it has evolved; the succession stipulates a co-existence although the material in which the whole series of changes has taken place remains the same.

The earlier psychic state may not have manifested itself for years but nevertheless continues to exist to the extent that it may some day again become the form in which psychic forces express themselves, in fact the only form, as though all subsequent developments had been annulled and made regressive. This extraordinary plasticity of psychic development is not without limits as to its direction; one can describe it as a special capacity for retrograde action or regression, for it sometimes happens that a later and higher stage of development that has been abandoned cannot be attained again. But the primitive conditions can always be reconstructed; the primitive psyche is in the strictest sense indestructible.

The so-called mental diseases must make the impression on the layman of mental and psychic life fallen into decay. In reality the destruction concerns only later acquisitions and developments. The nature of mental diseases consists in the return to former states of the affective life and function. An excellent example of the plasticity of the psychic life is the state of sleep, which we all court every night.

Since we know how to interpret even the maddest and most confused dreams, we know that every time we go to sleep we throw aside our hard won morality like a garment in order to put it on again in the morning. This laying bare is, of course, harmless, because we are paralyzed and condemned to inactivity by the sleeping state.

Only the dream can inform us of the regression of our emotional life to an earlier stage of development. Thus, for instance, it is worthy of note that all our dreams are governed by purely egotistic motives. One of my English friends once presented this theory to a scientific meeting in America, whereupon a lady present made the remark that this might perhaps be true of Austrians, but she ventured to assert for herself and her friends that even in dreams they always felt altruistically. My friend, although himself a member of the English race, was obliged to contradict the lady energetically on the basis of his experience in dream analysis. The noble Americans are just as egotistic in their dreams as the Austrians.

The transformation of impulses upon which our cultural adaptability rests can therefore also be permanently or temporarily made regressive. Without doubt the influences of war belong to those forces which can create such regressions; we therefore need not deny cultural adaptibility to all those who at present are acting in such an uncivilized manner, and may expect that the refinement of their impulses will continue in more peaceful times.

But there is perhaps another symptom of our fellow citizens of the world which has caused us no less surprise and fear than this descent from former ethical heights which has been so painful to us. I mean the lack of insight that our greatest intellectual leaders have shown, their obduracy, their inaccessibility to the most impressive arguments, their uncritical credulity concerning the most contestable assertions. This certainly presents a sad picture, and I wish expressly to emphasize that I am by no means a blinded partisan who finds all the intellectual mistakes on one side. But this phenomenon is more easily explained and far less serious than the one which we have just considered. Students of human nature and philosophers have long ago taught us that we do wrong to value our intelligence as an independent force and to overlook its dependence upon our emotional life. According to their view our intellect can work reliably only when it is removed from the influence of powerful incitements; otherwise it acts simply as an instrument at the beck and call of our will and delivers the results which the will demands. Logical argumentation is therefore powerless against affective interests; that is why arguing with reasons which, according to Falstaff, are as common as blackberries, are so fruitless where our interests are concerned. Whenever possible psychoanalytic experience has driven home this assertion. It is in a

position to prove every day that the cleverest people suddenly behave as unintelligently as defectives as soon as their understanding encounters emotional resistance, but that they regain their intelligence completely as soon as this resistance has been overcome. This blindness to logic which this war has so frequently conjured up in just our best fellow citizens, is therefore a secondary phenomenon, the result of emotional excitement and destined, we hope, to disappear simultaneously with it.

If we have thus come to a fresh understanding of our estranged fellow citizens we can more easily bear the disappointment which nations have caused us, for of them we must only make demands of a far more modest nature. They are perhaps repeating the development of the individual and at the present day still exhibit very primitive stages of development with a correspondingly slow progress towards the formation of higher unities. It is in keeping with this that the educational factor of an outer compulsion to morality, which we found so active in the individual, is barely perceptible in them. We had indeed hoped that the wonderful community of interests established by intercourse and the exchange of products would result in the beginning of such a compulsion, but it seems that nations obey their passions of the moment far more than their interests. At most they make use of their interests to justify the gratification of their passions.

It is indeed a mystery why the individual members of nations should disdain, hate, and abhor each other at all, even in times of peace. I do not know why it is. It seems as if all the moral achievements of the individual were obliterated in the case of a large number of people, not to mention millions, until only the most primitive, oldest, and most brutal psychic inhibitions remained.

Perhaps only later developments will succeed in changing these lamentable conditions. But a little more truthfulness and straightforward dealing on all sides, both in the relation of people towards each other and between themselves and those who govern them, might smooth the way for such a change.

II. OUR ATTITUDE TOWARDS DEATH

IT remains for us to consider the second factor of which I have already spoken which accounts for our feeling of strangeness in a world which used to seem so beautiful and familiar to us. I refer to the disturbance in our former attitude towards death.

Our attitude had not been a sincere one. To listen to us we were, of course, prepared to maintain that death is the necessary termination of life, that everyone of us owes nature his death and must be prepared to pay his debt, in short, that death was natural, undeniable, and inevitable. In practice we were accustomed to act as if matters were quite different. We have shown an unmistakable tendency to put death aside, to eliminate it from life. We attempted to hush it up, in fact, we have the proverb: to think of something as of death. Of course we meant our own death. We cannot, indeed, imagine our own death; whenever we try to do so we find that we survive ourselves as spectators. The school of psychoanalysis could thus assert that at bottom no one believes in his own death, which amounts to saying: in the unconscious every one of us is convinced of his immortality.

As far as the death of another person is concerned every man of culture will studiously avoid mentioning this possibility in the presence of the person in question. Only children ignore this restraint; they boldly threaten each other with the possibility of death, and are quite capable of giving expression to the thought of death in relation to the persons they love, as, for instance: Dear Mama, when unfortunately, you are dead, I shall do so and so. The civilized adult also likes to avoid entertaining the thought of another's death lest he seem harsh or unkind, unless his profession as a physician or a lawyer brings up the question. Least of all would he permit himself to think of somebody's death if this event is connected with a gain of freedom, wealth, or position. Death is, of course, not deferred through our sensitiveness on the subject, and when it occurs we are always deeply affected, as if our expectations had been shattered. We regularly lay stress upon the unexpected causes of death, we speak of the accident, the infection, or advanced age, and thus betray our endeavor to debase death from a necessity to an accident. A large number of deaths seems unspeakably dreadful to us. We assume a special attitude towards the dead,

something almost like admiration for one who has accomplished a very difficult feat. We suspend criticism of him, overlooking whatever wrongs he may have done, and issue the command, *de mortuis nil nisi bene*: we act as if we were justified in singing his praises at the funeral oration, and inscribe only what is to his advantage on the tombstone. This consideration for the dead, which he really no longer needs, is more important to us than the truth and to most of us, certainly, it is more important than consideration for the living.

This conventional attitude of civilized people towards death is made still more striking by our complete collapse at the death of a person closely related to us, such as a parent, a wife or husband, a brother or sister, a child or a dear friend. We bury our hopes, our wishes, and our desires with the dead, we are inconsolable and refuse to replace our loss. We act in this case as if we belonged to the tribe of the Asra who also die when those whom they love perish.

But this attitude of ours towards death exerts a powerful influence upon our lives. Life becomes impoverished and loses its interest when life itself, the highest stake in the game of living, must not be risked. It becomes as hollow and empty as an American flirtation in which it is understood from the beginning that nothing is to happen, in contrast to a continental love affair in which both partners must always bear in mind the serious consequences. Our emotional ties, the unbearable intensity of our grief, make us disinclined to court dangers for ourselves and those belonging to us. We do not dare to contemplate a number of undertakings that are dangerous but really indispensable, such as aeroplane flights, expeditions to distant countries, and experiments with explosive substances. We are paralyzed by the thought of who is to replace the son to his mother, the husband to his wife, or the father to his children, should an accident occur. A number of other renunciations and exclusions result from this tendency to rule out death from the calculations of life. And yet the motto of the Hanseatic League said: *Navigare necesse est, vivere non necesse*: It is necessary to sail the seas, but not to live.

It is therefore inevitable that we should seek compensation for the loss of life in the world of fiction, in literature, and in the theater. There we still find people who know how to die, who are even quite capable of killing others. There alone the condition for reconciling ourselves to death is fulfilled, namely, if beneath all the vicissitudes of life a permanent life

still remains to us. It is really too sad that it may happen in life as in chess, where a false move can force us to lose the game, but with this difference, that we cannot begin a return match. In the realm of fiction we find the many lives in one for which we crave. We die in identification with a certain hero and yet we outlive him and, quite unharmed, are prepared to die again with the next hero.

It is obvious that the war must brush aside this conventional treatment of death. Death is no longer to be denied; we are compelled to believe in it. People really die and no longer one by one, but in large numbers, often ten thousand in one day. It is no longer an accident. Of course, it still seems accidental whether a particular bullet strikes this man or that but the survivor may easily be struck down by a second bullet, and the accumulation of deaths ends the impression of accident. Life has indeed become interesting again; it has once more received its full significance.

Let us make a division here and separate those who risk their lives in battle from those who remain at home, where they can only expect to lose one of their loved ones through injury, illness, or infection. It would certainly be very interesting to study the changes in the psychology of the combatants but I know too little about this. We must stick to the second group, to which we ourselves belong. I have already stated that I think the confusion and paralysis of our activities from which we are suffering is essentially determined by the fact that we cannot retain our previous attitude towards death. Perhaps it will help us to direct our psychological investigation to two other attitudes towards death, one of which we may ascribe to primitive man, while the other is still preserved, though invisible to our consciousness, in the deeper layers of our psychic life.

The attitude of prehistoric man towards death is, of course, known to us only through deductions and reconstructions, but I am of the opinion that these have given us fairly trustworthy information.

Primitive man maintained a very curious attitude towards death. It is not at all consistent but rather contradictory. On the one hand he took death very seriously, recognized it as the termination of life, and made use of it in this sense; but, on the other hand, he also denied death and reduced it to nothingness. This contradiction was made possible by the fact that he maintained a radically different position in regard to the death of others, a stranger or an enemy, than in regard to his own. The death of another person fitted in with his idea, it signified the annihilation of the hated one,

and primitive man had no scruples against bringing it about. He must have been a very passionate being, more cruel and vicious than other animals. He liked to kill and did it as a matter of course. Nor need we attribute to him the instinct which restrains other animals from killing and devouring their own species.

As a matter of fact the primitive history of mankind is filled with murder. The history of the world which is still taught to our children is essentially a series of race murders. The dimly felt sense of guilt under which man has lived since archaic times, and which in many religions has been condensed into the assumption of a primal guilt, a hereditary sin, is probably the expression of a blood guilt, the burden of which primitive man assumed. In my book entitled “Totem and Taboo,” 1913, I have followed the hints of W. Robertson Smith, Atkinson, and Charles Darwin in the attempt to fathom the nature of this ancient guilt, and am of the opinion that the Christian doctrine of today still makes it possible for us to work back to its origin.

If the Son of God had to sacrifice his life to absolve mankind from original sin, then, according to the law of retaliation, the return of like for like, this sin must have been an act of killing, a murder. Nothing else could call for the sacrifice of a life in expiation. And if original sin was a sin against the God Father, the oldest sin of mankind must have been a patricide — the killing of the primal father of the primitive human horde, whose memory picture later was transfigured into a deity.

Primitive man was as incapable of imagining and realizing his own death as any one of us are today. But a case arose in which the two opposite attitudes towards death clashed and came into conflict with each other, with results that are both significant and far reaching. Such a case was given when primitive man saw one of his own relatives die, his wife, child, or friend, whom he certainly loved as we do ours; for love cannot be much younger than the lust for murder. In his pain he must have discovered that he, too, could die, an admission against which his whole being must have revolted, for everyone of these loved ones was a part of his own beloved self. On the other hand again, every such death was satisfactory to him, for there was also something foreign in each one of these persons. The law of emotional ambivalence, which today still governs our emotional relations to those whom we love, certainly obtained far more widely in primitive times. The beloved dead had nevertheless

roused some hostile feelings in primitive man just because they had been both friends and enemies.

Philosophers have maintained that the intellectual puzzle which the picture of death presented to primitive man forced him to reflect and became the starting point of every speculation. I believe the philosophers here think too philosophically, they give too little consideration to the primary effective motive. I should therefore like to correct and limit the above assertion; primitive man probably triumphed at the side of the corpse of the slain enemy, without finding any occasion to puzzle his head about the riddle of life and death. It was not the intellectual puzzle or any particular death which roused the spirit of inquiry in man, but the conflict of emotions at the death of beloved and withal foreign and hated persons.

From this emotional conflict psychology arose. Man could no longer keep death away from him, for he had tasted of it in his grief for the deceased, but he did not want to acknowledge it, since he could not imagine himself dead. He therefore formed a compromise and concealed his own death but denied it the significance of destroying life, a distinction for which the death of his enemies had given him no motive. He invented spirits during his contemplation of the corpse of the person he loved, and his consciousness of guilt over the gratification which mingled with his grief brought it about that these first created spirits were transformed into evil demons who were to be feared. The changes wrought by death suggested to him to divide the individual into body and soul, at first several souls, and in this way his train of thought paralleled the disintegration process inaugurated by death. The continued remembrance of the dead became the basis of the assumption of other forms of existence and gave him the idea of a future life after apparent death.

These later forms of existence were at first only vaguely associated appendages to those whom death had cut off, and enjoyed only slight esteem until much later times; they still betrayed a very meagre knowledge. The reply which the soul of Achilles made to Odysseus comes to our mind:

> Erst in the life on the earth, no less than a god we revered thee,
>
> We the Achaeans; and now in the realm of the dead as a monarch

Here thou dost rule; then why should death thus grieve thee, Achilles?

Thus did I speak: forthwith then answering thus he addressed me.

Speak not smoothly of death, I beseech, O famous Odysseus,

Better by far to remain on the earth as the thrall of another,

E'en of a portionless man that hath means right scanty of living,

Rather than reign sole king in the realm of the bodiless phantoms.

Odysseus XI, verse 484-491

Translated by H. B. Coterill.

Heine has rendered this in a forcible and bitter parody:

The smallest living philistine,
At Stuckert on the Neckar
Is much happier than I am,
Son of Pelleus, the dead hero,
Shadowy ruler of the Underworld.

It was much later before religions managed to declare this after-life as the more valuable and perfect and to debase our mortal life to a mere preparation for the life to come. It was then only logical to prolong our existence into the past and to invent former existences, transmigrations of souls, and reincarnations, all with the object of depriving death of its meaning as the termination of life. It was as early as this that the denial of death, which we described as the product of conventional culture, originated.

Contemplation of the corpse of the person loved gave birth not only to the theory of the soul, the belief in immortality, and implanted the deep

roots of the human sense of guilt, but it also created the first ethical laws. The first and most important prohibition of the awakening conscience declared: Thou shalt not kill. This arose as a reaction against the gratification of hate for the beloved dead which is concealed behind grief, and was gradually extended to the unloved stranger and finally also to the enemy.

Civilized man no longer feels this way in regard to killing enemies. When the fierce struggle of this war will have reached a decision every victorious warrior will joyfully and without delay return home to his wife and children, undisturbed by thoughts of the enemy he has killed either at close quarters or with weapons operating at a distance.

It is worthy of note that the primitive races which still inhabit the earth and who are certainly closer to primitive man than we, act differently in this respect, or have so acted as long as they did not yet feel the influence of our civilization. The savage, such as the Australian, the Bushman, or the inhabitant of Terra del Fuego, is by no means a remorseless murderer; when he returns home as victor from the war path he is not allowed to enter his village or touch his wife until he has expiated his war murders through lengthy and often painful penances. The explanation for this is, of course, related to his superstition; the savage fears the avenging spirit of the slain. But the spirits of the fallen enemy are nothing but the expression of his evil conscience over his blood guilt; behind this superstition there lies concealed a bit of ethical delicacy of feeling which has been lost to us civilized beings.

Pious souls, who would like to think us removed from contact with what is evil and mean, will surely not fail to draw satisfactory conclusions in regard to the strength of the ethical impulses which have been implanted in us from these early and forcible murder prohibitions. Unfortunately this argument proves even more for the opposite contention.

Such a powerful inhibition can only be directed against an equally strong impulse. What no human being desires to do does not have to be forbidden, it is self-exclusive. The very emphasis of the commandment: Thou shalt not kill, makes it certain that we are descended from an endlessly long chain of generations of murderers, whose love of murder was in their blood as it is perhaps also in ours. The ethical strivings of mankind, with the strength and significance of which we need not quarrel, are an acquisition of the history of man; they have since become, though

unfortunately in very variable quantities, the hereditary possessions of people of today.

Let us now leave primitive man and turn to the unconscious in our psyche. Here we depend entirely upon psychoanalytic investigation, the only method which reaches such depths. The question is what is the attitude of our unconscious towards death. In answer we say that it is almost like that of primitive man. In this respect, as well as in many others, the man of prehistoric times lives on, unchanged, in our conscious.

Our unconscious therefore does not believe in its own death; it acts as though it were immortal. What we call our unconscious, those deepest layers in our psyche which consist of impulses, recognizes no negative or any form of denial and resolves all contradictions, so that it does not acknowledge its own death, to which we can give only a negative content. The idea of death finds absolutely no acceptance in our impulses. This is perhaps the real secret of heroism. The rational basis of heroism is dependent upon the decision that one's own life cannot be worth as much as certain abstract common ideals. But I believe that instinctive or impulsive heroism is much more frequently independent of such motivation and simply defies danger on the assurance which animated Hans, the stone-cutter, a character in Anzengruber, who always said to himself: Nothing can happen to me. Or that motivation only serves to clear away the hesitations which might restrain the corresponding heroic reaction in the unconscious. The fear of death, which controls us more frequently than we are aware, is comparatively secondary and is usually the outcome of the consciousness of guilt.

On the other hand we recognize the death of strangers and of enemies and sentence them to it just as willingly and unhesitatingly as primitive man. Here there is indeed a distinction which becomes decisive in practice. Our unconscious does not carry out the killing, it only thinks and wishes it. But it would be wrong to underestimate the psychic reality so completely in comparison to the practical reality. It is really important and full of serious consequences.

In our unconscious we daily and hourly do away with all those who stand in our way, all those who have insulted or harmed us. The expression: "The devil take him," which so frequently crosses our lips in the form of an ill-humored jest, but by which we really intend to say, "Death take him," is a serious and forceful death wish in our unconscious.

Indeed our unconscious murders even for trifles; like the old Athenian law of Draco, it knows no other punishment for crime than death, and this not without a certain consistency, for every injury done to our all-mighty and self-glorifying self is at bottom a *crimen laesae majestatis*.

Thus, if we are to be judged by our unconscious wishes, we ourselves are nothing but a band of murderers, just like primitive man. It is lucky that all wishes do not possess the power which people of primitive times attributed to them. For in the cross fire of mutual maledictions mankind would have perished long ago, not excepting the best and wisest of men as well as the most beautiful and charming women.

As a rule the layman refuses to believe these theories of psychoanalysis. They are rejected as calumnies which can be ignored in the face of the assurances of consciousness, while the few signs through which the unconscious betrays itself to consciousness are cleverly overlooked. It is therefore in place here to point out that many thinkers who could not possibly have been influenced by psychoanalysis have very clearly accused our silent thought of a readiness to ignore the murder prohibition in order to clear away what stands in our path. Instead of quoting many examples I have chosen one which is very famous. In his novel, *Père Goriot*, Balzac refers to a place in the works of J. J. Rousseau where this author asks the reader what he would do if, without leaving Paris and, of course, without being discovered, he could kill an old mandarin in Peking, with great profit to himself, by a mere act of the will. He makes it possible for us to guess that he does not consider the life of this dignitary very secure. “To kill your mandarin” has become proverbial for this secret readiness to kill, even on the part of people of today.

There are also a number of cynical jokes and anecdotes which bear witness to the same effect, such as the remark attributed to the husband: “If one of us dies I shall move to Paris.” Such cynical jokes would not be possible if they did not have an unavowed truth to reveal which we cannot admit when it is baldly and seriously stated. It is well known that one may even speak the truth in jest.

A case arises for our consciousness, just as it did for primitive man, in which the two opposite attitudes towards death, one of which acknowledges it as the destroyer of life, while the other denies the reality of death, clash and come into conflict. The case is identical for both, it consists of the death of one of our loved ones, of a parent or a partner in

wedlock, of a brother or a sister, of a child or a friend. These persons we love are on the one hand a part of our inner possessions and a constituent of our own selves, but on the other hand they are also in part strangers and even enemies. Except in a few instances, even the tenderest and closest love relations also contain a bit of hostility which can rouse an unconscious death wish. But at the present day this ambivalent conflict no longer results in the development of ethics and soul theories, but in neuroses which also gives us a profound insight into the normal psychic life. Doctors who practice psychoanalysis have frequently had to deal with the symptom of over tender care for the welfare of relatives or with wholly unfounded self reproaches after the death of a beloved person. The study of these cases has left them in no doubt as to the significance of unconscious death wishes.

The layman feels an extraordinary horror at the possibility of such an emotion and takes his aversion to it as a legitimate ground for disbelief in the assertions of psychoanalysis. I think he is wrong there. No debasing of our love life is intended and none such has resulted. It is indeed foreign to our comprehension as well as to our feelings to unite love and hate in this manner, but in so far as nature employs these contrasts she brings it about that love is always kept alive and fresh in order to safeguard it against the hate that is lurking behind it. It may be said that we owe the most beautiful unfolding of our love life to the reaction against this hostile impulse which we feel in our hearts.

Let us sum up what we have said. Our unconscious is just as inaccessible to the conception of our own death, just as much inclined to kill the stranger, and just as divided, or ambivalent towards the persons we love as was primitive man. But how far we are removed from this primitive state in our conventionally civilized attitude towards death!

It is easy to see how war enters into this disunity. War strips off the later deposits of civilization and allows the primitive man in us to reappear. It forces us again to be heroes who cannot believe in their own death, it stamps all strangers as enemies whose death we ought to cause or wish; it counsels us to rise above the death of those whom we love. But war cannot be abolished; as long as the conditions of existence among races are so varied and the repulsions between them are so vehement, there will have to be wars. The question then arises whether we shall be the ones to yield and adapt ourselves to it. Shall we not admit that in our civilized

attitude towards death we have again lived psychologically beyond our means? Shall we not turn around and avow the truth? Were it not better to give death the place to which it is entitled both in reality and in our thoughts and to reveal a little more of our unconscious attitude towards death which up to now we have so carefully suppressed? This may not appear a very high achievement and in some respects rather a step backwards, a kind of regression, but at least it has the advantage of taking the truth into account a little more and of making life more bearable again. To bear life remains, after all, the first duty of the living. The illusion becomes worthless if it disturbs us in this.

We remember the old saying:

Si vis pacem, para bellum.

If you wish peace, prepare for war.

The times call for a paraphrase:

Si vis vitam, para mortem.

If you wish life, prepare for death.

BEYOND THE PLEASURE PRINCIPLE

Translated by A. A. Brill

This 1920 essay marks a major turning point in Freud's theoretical approach. Previously, Freud had attributed the majority of human behaviour to sexual instinct, but in *Beyond the Pleasure Principle* Freud goes beyond the simple pleasure principle, developing his theory of drives with the addition of the death drives, often referred to as *Thanatos*. The essay describes humans as struggling between two opposing drives: *Eros*, which produces creativity, harmony, sexual connection, reproduction and self-preservation; and *Thanatos*, which brings destruction, repetition, aggression, compulsion and self-destruction.

Freud opens with a commonplace theory unchallenged at the time in psychoanalytic theory: 'The course of mental events is automatically regulated by the pleasure principle... a strong tendency toward the pleasure principle'". After considering the inevitable presence of unpleasant experiences in the life of the mind, he concludes the book's first section to the effect that the presence of such unpleasant experiences does not contradict the dominance of the pleasure principle... does not seem to necessitate any far-reaching limitation of the pleasure principle. Freud proceeds to examine evidence for the existence of hitherto unsuspected forces 'beyond' the pleasure principle. He considers exceptions to the universal power of the pleasure principle— "situations ... with which the pleasure principle cannot cope adequately" — in four main areas: children's games, as exemplified in his grandson's famous "fort-da" game; "the recurrent dreams of war neurotics ...; the pattern of self-injuring behaviour that can be traced through the lives of certain people; the tendency of many patients in psycho-analysis to act out over and over again unpleasant experiences of their childhood."

Beyond the Pleasure Principle is one of Freud's most controversial texts. Jacques Lacan, a famous Freudian, called it "an extraordinary text" and "unbelievably ambiguous, almost confused". One of Freud's most sympathetic biographers wrote that "*Beyond the Pleasure Principle* is a difficult text ... the reassuring intimacy with clinical experience that marks most of Freud's papers, even at their most theoretical, seems faint here,

almost absent." He went on to quote Freud's personal physician: "Max Schur, whom no one can accuse of reading Freud unsympathetically, said flatly: 'We can only assume that Freud's conclusions... are an example of ad hoc reasoning to prove a preformed hypothesis ... throughout *Beyond the Pleasure Principle'*".

IN the psycho-analytical theory of the mind we take it for granted that the course of mental processes is automatically regulated by ‘the pleasure-principle’: that is to say, we believe that any given process originates in an unpleasant state of tension and thereupon determines for itself such a path that its ultimate issue coincides with a relaxation of this tension, i. e. with avoidance of ‘pain’ or with production of pleasure. When we consider the psychic processes under observation in reference to such a sequence we are introducing into our work the *economic* point of view. In our opinion a presentation which seeks to estimate, not only the *topographical* and *dynamic,* but also the economic element is the most complete that we can at present imagine, and deserves to be distinguished by the term *meta-psychological*.

We are not interested in examining how far in our assertion of the pleasure-principle we have approached to or adopted any given philosophical system historically established. Our approach to such speculative hypotheses is by way of our endeavour to describe and account for the facts falling within our daily sphere of observation. Priority and originality are not among the aims which psycho-analysis sets itself, and the impressions on which the statement of this principle is founded are of so unmistakable a kind that it is scarcely possible to overlook them. On the other hand, we should willingly acknowledge our indebtedness to any philosophical or psychological theory that could tell us the meaning of these feelings of pleasure and ‘pain’ which affect us so powerfully. Unfortunately no theory of any value is forthcoming. It is the obscurest and least penetrable region of psychic life and, while it is impossible for us to avoid touching on it, the most elastic hypothesis will be, to my mind, the best. We have decided to consider pleasure and ‘pain’ in relation to the quantity of excitation present in the psychic life — and not confined in any way — along such lines that ‘pain’ corresponds with an increase and pleasure with a decrease in this quantity. We do not thereby commit ourselves to a simple relationship between the strength of the feelings and the changes corresponding with them, least of all, judging from psycho-physiological experiences, to any view of a direct proportion existing between them; probably the amount of diminution or increase in a given

time is the decisive factor for feeling. Possibly there is room here for experimental work, but it is inadvisable for us analysts to go further into these problems until we can be guided by quite definite observations.

We cannot however profess the like indifference when we find that an investigator of such penetration as G. Th. Fechner has advocated a conception of pleasure and 'pain' which in essentials coincides with that forced upon us by psycho-analytic work. Fechner's pronouncement is to be found in his short work 'Einige Ideen zur Schöpfungs- und Entwicklungsgeschichte der Organismen', 1873 (Section XI, Note p. 94) and reads as follows: 'In so far as conscious impulses always bear a relation to pleasure or "pain", pleasure or "pain" may be thought of in psycho-physical relationship to conditions of stability and instability, and upon this may be based the hypothesis I intend to develop elsewhere, viz.: that every psycho-physical movement rising above the threshold of consciousness is charged with pleasure in proportion as it approximates — beyond a certain limit — to complete equilibrium, and with "pain" in proportion as it departs from it beyond a certain limit; while between the two limits which may be described as the qualitative thresholds of "pain" or pleasure, there is a certain area of aesthetic indifference.'

The facts that have led us to believe in the supremacy of the pleasure-principle in psychic life also find expression in the hypothesis that there is an attempt on the part of the psychic apparatus to keep the quantity of excitation present as low as possible, or at least constant. This is the same supposition only put into another form, for, if the psychic apparatus operates in the direction of keeping down the quantity of excitation, all that tends to increase it must be felt to be contrary to function, that is to say painful. The pleasure-principle is deduced from the principle of constancy; in reality the principle of constancy was inferred from the facts that necessitated our assumption of the pleasure-principle. On more detailed discussion we shall find further that this tendency on the part of the psychic apparatus postulated by us may be classified as a special case of Fechner's principle of the *tendency towards stability* to which he has related the pleasure-pain feelings.

In that event, however, it must be affirmed that it is not strictly correct to speak of a supremacy of the pleasure-principle over the course of psychic processes. If such existed, then the vast majority of our psychic processes would necessarily be accompanied by pleasure or would

conduce to it, while the most ordinary experience emphatically contradicts any such conclusion. One can only say that a strong tendency towards the pleasure-principle exists in the psyche, to which, however, certain other forces or conditions are opposed, so that the ultimate issue cannot always be in accordance with the pleasure-tendency. Compare the comment of Fechner in a similar connection. [1] 'Therewithal it is to be noted that the tendency towards the goal does not imply the attainment of it and that in general the goal is only approximately attainable….' If we now address ourselves to the question of what circumstances have the power to frustrate the successful carrying out of the pleasure-principle we shall be treading on safer and better-known ground, and we can draw in abundant measure on our analytical experiences for the answer.

The first case of such a check on the pleasure-principle is perfectly familiar to us in the regularity of its occurrence. We know that the pleasure-principle is adjusted to a primary mode of operation on the part of the psychic apparatus, and that for the preservation of the organism amid the difficulties of the external world it is ab initio useless and indeed extremely dangerous. Under the influence of the instinct of the ego for self-preservation it is replaced by the 'reality-principle', which without giving up the intention of ultimately attaining pleasure yet demands and enforces the postponement of satisfaction, the renunciation of manifold possibilities of it, and the temporary endurance of 'pain' on the long and circuitous road to pleasure. The pleasure-principle however remains for a long time the method of operation of the sex impulses, which are not so easily educable, and it happens over and over again that whether acting through these impulses or operating in the ego itself it prevails over the reality-principle to the detriment of the whole organism.

It is at the same time indubitable that the replacement of the pleasure-principle by the reality-principle can account only for a small part, and that not the most intense, of painful experiences. Another and no less regular source of 'pain' proceeds from the conflicts and dissociations in the psychic apparatus during the development of the ego towards a more highly co-ordinated organisation. Nearly all the energy with which the apparatus is charged comes from the inborn instincts, but not all of these are allowed to develop to the same stage. On the way it over and again happens that particular instincts, or portions of them, prove irreconcilable in their aims or demands with others which can be welded into the

comprehensive unity of the ego. They are thereupon split off from this unity by the process of repression, retained on lower stages of psychic development, and for the time being cut off from all possibility of gratification. If they then succeed, as so easily happens with the repressed sex-impulses, in fighting their way through — along circuitous routes — to a direct or a substitutive gratification, this success, which might otherwise have brought pleasure, is experienced by the ego as ‘pain’. In consequence of the old conflict which ended in repression the pleasure-principle has been violated anew, just at the moment when certain impulses were at work on the achievement of fresh pleasure in pursuance of the principle. The details of the process by which repression changes a possibility of pleasure into a source of ‘pain’ are not yet fully understood, or are not yet capable of clear presentation, but it is certain that all neurotic ‘pain’ is of this kind, is pleasure which cannot be experienced as such.

The two sources of ‘pain’ here indicated still do not nearly cover the majority of our painful experiences, but as to the rest one may say with a fair show of reason that their presence does not impugn the supremacy of the pleasure-principle. Most of the ‘pain’ we experience is of a perceptual order, perception either of the urge of unsatisfied instincts or of something in the external world which may be painful in itself or may arouse painful anticipations in the psychic apparatus and is recognised by it as ‘danger’. The reaction to these claims of impulse and these threats of danger, a reaction in which the real activity of the psychic apparatus is manifested, may be guided correctly by the pleasure-principle or by the reality-principle which modifies this. It seems thus unnecessary to recognise a still more far-reaching limitation of the pleasure-principle, and nevertheless it is precisely the investigation of the psychic reaction to external danger that may supply new material and new questions in regard to the problem here treated.

ENDNOTES.

[1] op. cit., p. 90.

II

AFTER severe shock of a mechanical nature, railway collision or other accident in which danger to life is involved, a condition may arise which has long been recognised and to which the name ‘traumatic neurosis’ is attached. The terrible war that is just over has been responsible for an immense number of such maladies and at least has put an end to the inclination to explain them on the basis of organic injury to the nervous system due to the operation of mechanical force. [1] The clinical picture of traumatic neurosis approaches that of hysteria in its wealth of similar motor symptoms, but usually surpasses it in its strongly marked signs of subjective suffering — in this resembling rather hypochondria or melancholia — and in the evidences of a far more comprehensive general weakening and shattering of the mental functions. Neither the war neuroses nor the traumatic neuroses of peace are as yet fully understood. With the war neuroses some light was contributed, but also on the other hand a certain confusion introduced, by the fact that the same type of malady could occasionally occur without the interposition of gross mechanical force. In the traumatic neuroses there are two outstanding features which might serve as clues for further reflection: first that the chief causal factor seemed to lie in the element of surprise, in the fright; and secondly that an injury or wound sustained at the same time generally tended to prevent the occurrence of the neurosis. Fright, fear, apprehension are incorrectly used as synonymous expressions: in their relation to danger they admit of quite clear distinction. Apprehension (*Angst*) denotes a certain condition as of expectation of danger and preparation for it, even though it be an unknown one; fear (*Furcht*) requires a definite object of which one is afraid; fright (*Schreck*) is the name of the condition to which one is reduced if one encounters a danger without being prepared for it; it lays stress on the element of surprise. In my opinion apprehension cannot produce a traumatic neurosis; in apprehension there is something which protects against fright and therefore against the fright-neurosis. We shall return later to this dictum.

The study of dreams may be regarded as the most trustworthy approach to the exploration of the deeper psychic processes. Now in the traumatic neuroses the dream life has this peculiarity: it continually takes the patient back to the situation of his disaster, from which he awakens in renewed

terror. This fact has caused less surprise than it merits. The obtrusion on the patient over and again, even in sleep, of the impression made by the traumatic experience is taken as being merely a proof of its strength. The patient has so to speak undergone a psychical fixation as to the trauma. Fixations of this kind on the experience which has brought about the malady have long been known to us in connection with hysteria. Breuer and Freud stated in 1893 that hysterics suffer for the most part from reminiscences. In the war neuroses, observers, such as Ferenczi and Simmel, have been able to explain a number of motor symptoms as fixation on the factor of the trauma.

But I am not aware that the patients suffering from traumatic neuroses are much occupied in waking life with the recollection of what happened to them. They perhaps strive rather not to think of it. To regard it as self-evident that the dream at night takes them back to the situation which has caused the trouble is to misunderstand the nature of dreams. It would be more in correspondence with that nature if the patient were presented (in sleep) with images from the time of his normal health or of his hoped-for recovery. If we are not to go thoroughly astray as to the wish-fulfilment tendency of the dream in consequence of these dreams of the shock neuroses, perhaps the expedient is left us of supposing that in this condition the dream function suffers dislocation along with the others and is diverted from its usual ends, or else we should have to think of the enigmatic masochistic tendencies of the ego.

I propose now to leave the obscure and gloomy theme of the traumatic neuroses and to study the way in which the psychic apparatus works in one of its earliest normal activities. I refer to the play of children.

The different theories of child-play have recently been collated by S. Pfeifer in *Imago* [2] and their analytical value estimated; I may here refer the reader to this work. These theories endeavour to conjecture the motives of children's play, though without placing any special stress on the 'economic' point of view, i. e. consideration of the attainment of pleasure. Without the intention of making a comprehensive study of these phenomena I availed myself of an opportunity which offered of elucidating the first game invented by himself of a boy eighteen months old. It was more than a casual observation, for I lived for some weeks under the same roof as the child and his parents, and it was a considerable

time before the meaning of his puzzling and continually repeated performance became clear to me.

The child was in no respect forward in his intellectual development; at eighteen months he spoke only a few intelligible words, making besides sundry significant sounds which were understood by those about him. But he made himself understood by his parents and the maid-servant, and had a good reputation for behaving ‘properly’. He did not disturb his parents at night; he scrupulously obeyed orders about not touching various objects and not going into certain rooms; and above all he never cried when his mother went out and left him for hours together, although the tie to his mother was a very close one: she had not only nourished him herself, but had cared for him and brought him up without any outside help. Occasionally, however, this well-behaved child evinced the troublesome habit of flinging into the corner of the room or under the bed all the little things he could lay his hands on, so that to gather up his toys was often no light task. He accompanied this by an expression of interest and gratification, emitting a loud long-drawn-out ‘o-o-o-oh’ which in the judgement of the mother (one that coincided with my own) was not an interjection but meant ‘go away’ (*fort*). I saw at last that this was a game, and that the child used all his toys only to play ‘being gone’ (*fortsein*) with them. One day I made an observation that confirmed my view. The child had a wooden reel with a piece of string wound round it. It never occurred to him, for example, to drag this after him on the floor and so play horse and cart with it, but he kept throwing it with considerable skill, held by the string, over the side of his little draped cot, so that the reel disappeared into it, then said his significant ‘o-o-o-oh’ and drew the reel by the string out of the cot again, greeting its reappearance with a joyful *‘Da’* (there). This was therefore the complete game, disappearance and return, the first act being the only one generally observed by the onlookers, and the one untiringly repeated by the child as a game for its own sake, although the greater pleasure unquestionably attached to the second act. [3]

The meaning of the game was then not far to seek. It was connected with the child’s remarkable cultural achievement — the foregoing of the satisfaction of an instinct — as the result of which he could let his mother go away without making any fuss. He made it right with himself, so to speak, by dramatising the same disappearance and return with the objects he had at hand. It is of course of no importance for the affective value of

this game whether the child invented it himself or adopted it from a suggestion from outside. Our interest will attach itself to another point. The departure of the mother cannot possibly have been pleasant for the child, nor merely a matter of indifference. How then does it accord with the pleasure-principle that he repeats this painful experience as a game? The answer will perhaps be forthcoming that the departure must be played as the necessary prelude to the joyful return, and that in this latter lay the true purpose of the game. As against this, however, there is the observation that the first act, the going away, was played by itself as a game and far more frequently than the whole drama with its joyful conclusion.

The analysis of a single case of this kind yields no sure conclusion: on impartial consideration one gains the impression that it is from another motive that the child has turned the experience into a game. He was in the first place passive, was overtaken by the experience, but now brings himself in as playing an active part, by repeating the experience as a game in spite of its unpleasing nature. This effort might be ascribed to the impulse to obtain the mastery of a situation (the 'power' instinct), which remains independent of any question of whether the recollection was a pleasant one or not. But another interpretation may be attempted. The flinging away of the object so that it is gone might be the gratification of an impulse of revenge suppressed in real life but directed against the mother for going away, and would then have the defiant meaning: 'Yes, you can go, I don't want you, I am sending you away myself.' The same child a year later than my observations used to throw on the floor a toy which displeased him, and to say 'Go to the war!' He had been told that his absent father was at the war, and he did not miss him at all, giving the clearest indications that he did not wish to be disturbed in the sole possession of his mother. [4] It is known of other children also that they can give vent to similar hostile feelings by throwing objects away in place of people. [5] Thus one is left in doubt whether the compulsion to work over in psychic life what has made a deep impression, to make oneself fully master of it, can express itself primarily and independently of the pleasure-principle. In the case discussed here, however, the child might have repeated a disagreeable impression in play only because with the repetition was bound up a pleasure gain of a different kind but more direct.

Nor does the further pursuit of the question of play resolve our hesitations between two conceptions. We see that children repeat in their

play everything that has made a great impression on them in actual life, that they thereby abreact the strength of the impression and so to speak make themselves masters of the situation. But on the other hand it is clear enough that all their play is influenced by the dominant wish of their time of life: viz. to be grown-up and to be able to do what grown-up people do. It is also observable that the unpleasing character of the experience does not always prevent its being utilised as a game. If a doctor examines a child's throat, or performs a small operation on him, the alarming experience will quite certainly be made the subject of the next game, but in this the pleasure gain from another source is not to be overlooked. In passing from the passivity of experience to the activity of play the child applies to his playfellow the unpleasant occurrence that befell himself and so avenges himself on the person of this proxy.

From this discussion it is at all events evident that it is unnecessary to assume a particular imitation impulse as the motive of play. We may add the reminder that the dramatic and imitative art of adults, which differs from the behaviour of children in being directed towards the spectator, does not however spare the latter the most painful impressions, e. g. in tragedy, and yet can be felt by him as highly enjoyable. This convinces us that even under the domination of the pleasure-principle there are ways and means enough of making what is in itself disagreeable the object of memory and of psychic pre-occupation. A theory of aesthetics with an economic point of view should deal with these cases and situations ending in final pleasure gain: for our purposes they are of no help, since they presuppose the existence and supremacy of the pleasure-principle and bear no witness to the operation of tendencies beyond the pleasure-principle, that is to say, tendencies which might be of earlier origin and independent of this.

[3] This interpretation was fully established by a further observation. One day when the mother had been out for some hours she was greeted on her return by the information ‘Baby o-o-o-o’ which at first remained unintelligible. It soon proved that during his long lonely hours he had found a method of bringing about his own disappearance. He had discovered his reflection in the long mirror which nearly reached to the ground and had then crouched down in front of it, so that the reflection was *‘fort’*.

[4] When the child was five and three-quarter years old his mother died. Now, when she was really ‘gone’ (o-o-o), the boy showed no grief for her. A second child had, it is true, been born in the meantime and had aroused his strongest jealousy.

III

FIVE-AND-TWENTY years of intensive work have brought about a complete change in the more immediate aims of psycho-analytic technique. At first the endeavours of the analytic physician were confined to divining the unconscious of which his patient was unaware, effecting a synthesis of its various components and communicating it at the right time. Psychoanalysis was above all an art of interpretation. Since the therapeutic task was not thereby accomplished, the next aim was to compel the patient to confirm the reconstruction through his own memory. In this endeavour the chief emphasis was on the resistances of the patient; the art now lay in unveiling these as soon as possible, in calling the patient's attention to them, and by human influence — here came in suggestion acting as 'transference' — teaching him to abandon the resistances.

It then became increasingly clear, however, that the aim in view, the bringing into consciousness of the unconscious, was not fully attainable by this method either. The patient cannot recall all of what lies repressed, perhaps not even the essential part of it, and so gains no conviction that the conclusion presented to him is correct. He is obliged rather to *repeat* as a current experience what is repressed, instead of, as the physician would prefer to see him do, *recollecting* it as a fragment of the past. [1] This reproduction appearing with unwelcome fidelity always contains a fragment of the infantile sex-life, therefore of the Oedipus complex and its off-shoots, and is played regularly in the sphere of transference, i. e. the relationship to the physician. When this point in the treatment is reached, it may be said that the earlier neurosis is now replaced by a fresh one, viz. the transference-neurosis. The physician makes it his concern to limit the scope of this transference-neurosis as much as he can, to force into memory as much as possible, and to leave as little as possible to repetition. The relation established between memory and reproduction is different for every case. As a rule the physician cannot spare the patient this phase of the cure; he must let him live through a certain fragment of his forgotten life, and has to see to it that some measure of ascendency remains, in the light of which the apparent reality is always recognised as a reflection of a forgotten past. If this is successfully accomplished then

conviction on the part of the patient is attained, and with it the therapeutic result that depends on it.

In order to render more comprehensible this ‘repetition-compulsion’ which appears in the psychoanalytic treatment of neurotics, we must above all get entirely rid of the erroneous idea that in this struggle with resistances we are concerned with any resistance on the part of the unconscious. The unconscious, i. e. the ‘repressed’ material, offers no resistance whatever to the curative efforts; indeed it has no other aim than to force its way through the pressure weighing on it, either to consciousness or to discharge by means of some real action. The resistance in the treatment proceeds from the same higher levels and systems in the psychic life that in their time brought about the repression. But since the motives of the resistances, and indeed the resistances themselves, are found in the process of the treatment to be unconscious, we are well advised to amend an inadequacy in our mode of expression. We escape ambiguity if we contrast not the conscious and the unconscious, but the coherent ego and the repressed. Much in the ego is certainly unconscious itself, just what may be called the kernel of the ego; only a part of it comes under the category of preconscious. After thus replacing a purely descriptive method of expression by a systematic or dynamic one, we may say that the resistance on the part of the analysed person proceeds from his ego, and then we at once see that the ‘repetition-compulsion’ must be ascribed to the repressed element in the unconscious. It probably could not find expression till the work of the treatment coming to meet it had loosened the repression.

There is no doubt that the resistance of the conscious and preconscious ego subserves the pleasure-principle; it is trying to avoid the ‘pain’ that would be aroused by the release of the repressed material, and our efforts are directed to effecting an entry for such painful feeling by an appeal to the reality-principle. In what relation to the pleasure-principle then does the repetition-compulsion stand, that which expresses the force of what is repressed? It is plain that most of what is revived by the repetition-compulsion cannot but bring discomfort to the ego, for it promotes the bringing to light of the activities of repressed impulses; but that is a discomfort we have already taken into account and without subversion of the pleasure-principle, since it is ‘pain’ in respect of one system and at the same time satisfaction for the other. The new and remarkable fact,

however, that we have now to describe is that the repetition-compulsion also revives experiences of the past that contain no potentiality of pleasure, and which could at no time have been satisfactions, even of impulses since repressed.

The efflorescence of infantile sex-life was, by reason of the irreconcilability of its wishes with reality and the inadequacy of the childhood stage of development reached, destined to pass away. It perished in most painful circumstances and with feelings of a deeply distressing nature. Loss and failure in the sphere of the affections left behind on the ego-feeling marks of injury comparable to a narcissistic scar, which, according to my experience and the exposition given by Marcinowski, [2] yields the most important contribution to the 'inferiority complex' common among neurotics. The sex-quest to which the physical development of the child set limits could be brought to no satisfying conclusion; hence the plaint in later life: 'I can't do anything, I am never successful.' The bonds of tenderness linking the child more especially to the parent of the opposite sex succumbed to disappointment, to the vain expectation of satisfaction, and to the jealousy aroused by the birth of a new child, unmistakable proof as it is of the faithlessness of the loved parent; the child's attempt, undertaken with tragic seriousness, to produce another such child himself met with humiliating failure; while the partial withdrawal of the tenderness lavished on the little one, the more exacting demands of discipline and education, severe words and an occasional punishment finally revealed to him the whole extent of the disdain which is his portion. Some few regularly recurring types are to be found, according to the way in which the typical love of this period was brought to an end.

All these undesired happenings and painful affective situations are repeated by neurotics in the 'transference' stage and re-animated with much ingenuity. They struggle to break off the unfinished treatment, they know how to re-create the feeling of being disdained, how to force the physician to adopt brusque speech and a chilling manner towards them, they find suitable objects for their jealousy, they substitute for the ardently desired child of early days the promise of some great gift which becomes as little real as that was. Nothing of all this could ever have afforded any pleasure; one would suppose it ought to bring somewhat less 'pain' if revealed as memory rather than if lived through as a new experience. It is

a question naturally of the action of impulses that should lead to satisfaction, but the experience that instead of this they even then brought ‘pain’ has borne no result. The act is repeated in spite of everything; a powerful compulsion insists on it.

That which psycho-analysis reveals in the transference phenomena with neurotics can also be observed in the life of normal persons. It here gives the impression of a pursuing fate, a daemonic trait in their destiny, and psycho-analysis has from the outset regarded such a life history as in a large measure self-imposed and determined by infantile influences. The compulsion which thereby finds expression is in no way different from the repetition-compulsion of neurotics, even though such persons have never shown signs of a neurotic conflict resulting in symptoms. Thus one knows people with whom every human relationship ends in the same way: benefactors whose protégés, however different they may otherwise have been, invariably after a time desert them in ill-will, so that they are apparently condemned to drain to the dregs all the bitterness of ingratitude; men with whom every friendship ends in the friend’s treachery; others who indefinitely often in their lives invest some other person with authority either in their own eyes or generally, and themselves overthrow such authority after a given time, only to replace it by a new one; lovers whose tender relationships with women each and all run through the same phases and come to the same end, and so on. We are less astonished at this ‘endless repetition of the same’ if there is involved a question of active behaviour on the part of the person concerned, and if we detect in his character an unalterable trait which must always manifest itself in the repetition of identical experiences. Far more striking are those cases where the person seems to be experiencing something passively, without exerting any influence of his own, and yet always meets with the same fate over and over again. One may recall, for example, the story of the woman who married three men in succession, each of whom fell ill after a short time and whom she had to nurse till their death. [3] Tasso gives a singularly affecting poetical portrayal of such a trend of fate in the romantic epic: ‘Gerusalemme liberata.’ The hero, Tancred, has unwittingly slain Clorinda, the maiden he loved, who fought with him disguised in the armour of an enemy knight. After her burial he penetrates into the mysterious enchanted wood, the bane of the army of the crusaders. Here he hews down a tall tree with his sword, but from the gash in the trunk blood

streams forth and the voice of Clorinda whose soul is imprisoned in the tree cries out to him in reproach that he has once more wrought a baleful deed on his beloved.

In the light of such observations as these, drawn from the behaviour during transference and from the fate of human beings, we may venture to make the assumption that there really exists in psychic life a repetition-compulsion, which goes beyond the pleasure-principle. We shall now also feel disposed to relate to this compelling force the dreams of shock-patients and the play-impulse in children. We must of course remind ourselves that only in rare cases can we recognise the workings of this repetition-compulsion in a pure form, without the co-operation of other motives. As regards children's play we have already pointed out what other interpretations its origin permits. The repetition-compulsion and direct pleasurable satisfaction of impulse seem there to be inextricably intertwined. The transference phenomena obviously subserve the purpose of the resistance made by the ego persisting in its repression: the repetition-compulsion is, as it were, called to the aid of the ego, which is resolved to hold fast to the pleasure-principle. In what one might call the destiny compulsion much appears capable of rational explanation, so that no need is felt to establish a new and mysterious impulse. The least suspicious case is perhaps that of the shock-dream, but on closer examination it must be admitted that in the other examples too the state of affairs is not completely explained by the operation of the motives known to us. There remains enough over to justify the assumption of a repetition-compulsion, and this seems to us more primitive, more elementary, more instinctive than the pleasure-principle which is displaced by it. But if there is such a repetition-compulsion in psychic life, we should naturally like to know with what function it corresponds, under what conditions it may appear, and in what relation it stands to the pleasure-principle, to which we have heretofore ascribed the domination over the course of the processes of excitation in the psychic life.

IV

WHAT follows now is speculation, speculation often far-fetched, which each will according to his particular attitude acknowledge or neglect. Or one may call it the exploitation of an idea out of curiosity to see whither it will lead.

Psycho-analytic speculation starts from the impression gained on investigating unconscious processes that consciousness cannot be the most general characteristic of psychic processes, but merely a special function of them. Metapsychologically expressed, it asserts that consciousness is the functioning of a particular system which may be called Bw. Since consciousness essentially yields perceptions of excitations coming from without and feelings (*Empfindungen*) of pleasure and ‘pain’ which can only be derived from within the psychic apparatus, we may allot the system W-Bw. [1] (= perceptual consciousness) a position in space. It must lie on the boundary between outer and inner, must face towards the outer world, and must envelop the other psychic systems. We then note that in this assumption we have ventured nothing new, but are in agreement with the localising tendencies of cerebral anatomy, which places the ‘seat’ of consciousness in the cortical layer, the outermost enveloping layer of the central organ. Cerebral anatomy does not need to wonder why — anatomically speaking — consciousness should be accommodated on the surface of the brain, instead of being safely lodged somewhere in the deepest recesses of it. Perhaps we may carry matters a little further than this in our deduction of such a position for our system W-Bw.

Consciousness is not the only peculiar feature that we ascribe to the processes in this system. Our impressions gained by psycho-analytic experience lead us to the supposition that all excitation processes in the other systems leave in them permanent traces forming the foundations of memory-records which have nothing to do with the question of becoming conscious. They are often strongest and most enduring when the process that left them behind never reached consciousness at all. But we find it difficult to believe that such lasting traces of excitation are formed also in the system W-Bw. itself. If they remained permanently in consciousness they would very soon limit the fitness of the system for registration of new excitations; [2] on the other hand, if they became unconscious we should be confronted with the task of explaining the existence of unconscious

processes in a system whose functioning is otherwise accompanied by the phenomenon of consciousness. We should, so to speak, have gained nothing and altered nothing by our supposition which relegates to a special system the process of becoming conscious. Though this may not be an absolutely binding consideration, it may at any rate lead us to conjecture that becoming conscious and leaving behind a memory-trace are processes incompatible with each other in the same system. We should thus be able to say: in the system Bw. the process of excitation becomes conscious but it leaves behind no lasting trace; all the traces of it on which memory relies would come about in the next systems inwards from the propagation of the excitation on to them. It is on these lines that the scheme is sketched which I inserted into the speculative section of my 'Traumdeutung' in 1900. If one reflects how little we know from other sources about the origin of consciousness the pronouncement that *consciousness arises in the place of the memory-trace* must be conceded at least the importance of a statement which is to some extent definite.

The system Bw. would thus be characterised by the peculiarity that the excitation process does not leave in it, as it does in all other psychic systems, a permanent alteration of its elements, but is as it were discharged in the phenomenon of becoming conscious and vanishes. Such a departure from the general rule requires an explanation on the ground of a factor which comes into account in this one system only: this factor which is absent from all other systems might well be the exposed situation of the Bw. system — its immediate contact with the outer world.

Let us imagine the living organism in the simplest possible form as an undifferentiated vesicle of sensitive substance: then its surface, exposed as it is to the outer world, is by its very position differentiated and serves as an organ for receiving stimuli. Embryology, repeating as it does the history of evolution, does in fact show that the central nervous system arises from the ectoderm; the grey cortex of the brain remains a derivative of the primitive superficial layer and may have inherited essential properties from this. It would then be easily conceivable that, owing to the constant impact of external stimuli on the superficies of the vesicle, its substance would undergo lasting alteration to a certain depth, so that its excitation process takes a different course from that taken in the deeper layers. Thus a rind would be formed which would finally have been so burned through by the effects of stimulation that it presents the most

favourable conditions for the reception of stimuli and is incapable of any further modification. Applying this idea to the system Bw., this would mean that its elements are not susceptible of any further lasting alteration from the passage of the excitation, because they are already modified to the uttermost in that respect. But they are then capable of giving rise to consciousness. In what exactly these modifications of the substance and of the excitation process in it consist many views may be held which as yet cannot be tested. It may be assumed that the excitation has, in its transmission from one element to another, to overcome a resistance, and that this diminution of the resistance itself lays down the permanent trace of the excitation (a path): in system Bw. there would no longer exist any such resistance to transmission from one element to another. We may associate with this conception Breuer's distinction between quiescent (bound) and free-moving 'investment-energy' in the elements of the psychic systems; [3] the elements of the system Bw. would then convey no 'bound' energy, only free energy capable of discharge. In my opinion, however, it is better for the present to express oneself as to these conditions in the least committal way. At any rate by these speculations we should have brought the origin of consciousness into a certain connection with the position of the system Bw. and with the peculiarities of the excitation process to be ascribed to this.

We have more to say about the living vesicle with its receptive outer layer. This morsel of living substance floats about in an outer world which is charged with the most potent energies, and it would be destroyed by the operation of the stimuli proceeding from this world if it were not furnished with a protection against stimulation (*Reizschutz*). It acquires this through its outermost layer — which gives the structure that belongs to living matter — becoming in a measure inorganic, and this now operates as a special integument or membrane that keeps off the stimuli, i. e. makes it impossible for the energies of the outer world to act with more than a fragment of their intensity on the layers immediately below which have preserved their vitality. These are now able under cover of the protecting layer to devote themselves to the reception of those stimulus masses that have been let through. But the outer layer has by its own death secured all the deeper layers from a like fate — at least so long as no stimuli present themselves of such a strength as to break through the protective barrier. For the living organism protection against stimuli is

almost a more important task than reception of stimuli; the protective barrier is equipped with its own store of energy and must above all endeavour to protect the special forms of energy-transformations going on within itself from the equalising and therefore destructive influence of the enormous energies at work in the outer world. The reception of stimuli serves above all the purpose of collecting information about the direction and nature of the external stimuli, and for that it must suffice to take little samples of the outer world, to taste it, so to speak, in small quantities. In highly developed organisms the receptive external layer of what was once a vesicle has long been withdrawn into the depths of the body, but portions of it have been left on the surface immediately beneath the common protective barrier. These portions form the sense organs, which essentially comprise arrangements for the reception of specific stimuli, but also possess special arrangements adapted for a fresh protection against an overwhelming amount of stimulus, and for warding off unsuitable kinds of stimuli. It is characteristic of them that they assimilate only very small quantities of the outer stimulus, and take in only samples of the outer world; one might compare them to antennae which touch at the outer world and then constantly withdraw from it again.

At this point I shall permit myself to touch cursorily upon a theme which would deserve the most thorough treatment. The Kantian proposition that time and space are necessary modes of thought may be submitted to discussion to-day in the light of certain knowledge reached through psycho-analysis. We have found by experience that unconscious mental processes are in themselves ‘timeless’. That is to say to begin with: they are not arranged chronologically, time alters nothing in them, nor can the idea of time be applied to them. These are negative characteristics, which can be made plain only by instituting a comparison with conscious psychic processes. Our abstract conception of time seems rather to be derived wholly from the mode of functioning of the system W-Bw., and to correspond with a self-perception of it. In this mode of functioning of the system another form of protection against stimulation probably comes into play. I know that these statements sound very obscure, but I must confine myself to these few hints.

So far we have got to the point that the living vesicle is equipped with a protection against stimuli from the outer world. Before that, we had decided that the cortical layer next to it must be differentiated as the organ

for reception of external stimuli. But this sensitive layer (what is later the system Bw.) also receives excitations from within: the position of the system between outer and inner and the difference in the conditions under which this receptivity operates on the two sides become deciding factors for the functioning of the system and of the whole psychic apparatus. Towards the outer world there is a barrier against stimuli, and the mass of excitations coming up against it will take effect only on a reduced scale; towards what is within no protection against stimuli is possible, the excitations of the deeper layers pursue their way direct and in undiminished mass into the system, while certain characteristics of their course produce the series of pleasure-pain feelings. Naturally the excitations coming from within will, in conformity with their intensity and other qualitative characteristics (or possibly their amplitude), be more proportionate to the mode of operation of the system than the stimuli streaming in from the outer world. Two things are, however, decisively determined by these conditions: first the preponderance over all outer stimuli of the pleasure and 'pain' feelings, which are an index for processes within the mechanism; and secondly a shaping of behaviour towards such inner excitations as bring with them an overplus of 'pain'. There will be a tendency to treat them as though they were acting not from within but from without, in order for it to be possible to apply against them the defensive measures of the barrier against stimuli (*Reizschutz*). This is the origin of projection, for which so important a part is reserved in the production of pathological states.

I have the impression that by these last considerations we have approached nearer to a comprehension of the supremacy of the pleasure-principle, but we have not attained to an explanation of those cases which are opposed to it. Let us therefore go a step further. Such external excitations as are strong enough to break through the barrier against stimuli we call traumatic. In my opinion the concept of trauma involves such a relationship to an otherwise efficacious barrier. An occurrence such as an external trauma will undoubtedly provoke a very extensive disturbance in the workings of the energy of the organism, and will set in motion every kind of protective measure. But the pleasure-principle is to begin with put out of action here. The flooding of the psychic apparatus with large masses of stimuli can no longer be prevented: on the contrary, another task presents itself — to bring the stimulus under control, to

‘bind’ in the psyche the stimulus mass that has broken its way in, so as to bring about a discharge of it.

Probably the specific discomfort of bodily pain is the result of some local breaking through of the barrier against stimuli. From this point in the periphery there stream to the central psychic apparatus continual excitations such as would otherwise come only from within. [4] What are we to expect as the reaction of the psychic life to this invasion? From all sides the ‘charging energy’ is called on in order to create all round the breach correspondingly high ‘charges’ of energy. An immense ‘counter-charge’ is set up, in favour of which all the other psychic systems are impoverished, so that a wide-spread paralysis or diminution of other psychic activity follows. We endeavour to learn from examples such as these to base our metapsychological conjectures on such prototypes. Thus from this behaviour we draw the conclusion that even a highly charged system is able to receive new energy streaming in, to convert it into a ‘quiescent charge’, thus to ‘bind’ it psychically. The more intense is the intrinsic quiescent charge the greater is its binding force: and conversely the lower the charge of the system the less capable is it of receiving the energy that streams in, and so the more violent are the consequences when the barrier against stimuli is broken through. It is not a valid objection to this view that the intensifying of the charges round the place of irruption could be much more simply explained as the direct action of the oncoming mass of excitation. If that were so, the psychic apparatus would merely undergo an increase of its energy charges, and the paralysing character of pain, with the impoverishment of all the other systems, would remain without explanation. Nor do the very violent discharge effects of pain invalidate our explanation, for they happen in a reflex manner, that is to say, they follow without the interposition of the psychic apparatus. The indefinite nature of all the discussions that we term metapsychological naturally comes from the fact that we know nothing about the nature of the excitation-process in the elements of the psychic systems and do not feel justified in making any assumption about it. Thus we are all the time operating with a large X, which we carry over into every new formula. That this process is accomplished with energies which differ quantitatively is an easily admissible postulate, that it also has more than one quality (e. g. in the direction of amplitude) may be regarded as probable: the new consideration we have brought in is Breuer’s proposition that we have to

do with two ways in which a system may be filled with energy, so that a distinction has to be made between a ‘charging’ of the psychic systems (or its elements) that is free-flowing and striving to be discharged and one that is quiescent. Perhaps we may admit the conjecture that the binding of the energy streaming into the psychic apparatus consists in a translating of it from the free-flowing to the quiescent state.

I think one may venture (tentatively) to regard the ordinary traumatic neurosis as the result of an extensive rupture of the barrier against stimuli. In this way the old naïve doctrine of ‘shock’ would come into its own again, apparently in opposition to a later and psychologically more pretentious view which ascribes aetiological significance not to the effect of the mechanical force, but to the fright and the menace to life. But these opposing views are not irreconcilable, and the psycho-analytic conception of the traumatic neurosis is far from being identical with the crudest form of the ‘shock’ theory. While the latter takes the essential nature of the shock as residing in the direct injury to the molecular structure, or even to the histological structure, of the nervous elements, we seek to understand the effect of the shock by considering the breaking through of the barrier with which the psychic organ is provided against stimuli, and from the tasks with which this is thereby faced. Fright retains its meaning for us too. What conditions it is the failure of the mechanism of apprehension to make the proper preparation, including the over-charging of the systems first receiving the stimulus. In consequence of this lower degree of charging these systems are hardly in a position to bind the oncoming masses of excitation, and the consequences of the breaking through of the protective barrier appear all the more easily. We thus find that the apprehensive preparation, together with the over-charging of the receptive systems, represents the last line of defence against stimuli. For a great number of traumata the difference between the unprepared systems and those prepared by over-charging may turn the scale as to the outcome: with a trauma beyond a certain strength such a difference may no longer be of any importance. When the dreams of patients suffering from traumatic neuroses so regularly take them back to the situation of the disaster they do not thereby, it is true, serve the purpose of wish-fulfilment, the hallucinatory conjuring up of which has, under the domination of the pleasure-principle, become the function of dreams. But we may assume that they thereby subserve another purpose, which must be

fulfilled before the pleasure-principle can begin its sway. These dreams are attempts at restoring control of the stimuli by developing apprehension, the pretermission of which caused the traumatic neurosis. They thus afford us an insight into a function of the psychic apparatus, which without contradicting the pleasure-principle is nevertheless independent of it, and appears to be of earlier origin than the aim of attaining pleasure and avoiding 'pain'.

This is therefore the moment to concede for the first time an exception to the principle that the dream is a wish-fulfilment. Anxiety dreams are no such exception, as I have repeatedly and in detail shown; nor are the 'punishment dreams', for they merely put in the place of the interdicted wish-fulfilment the punishment appropriate to it, and are thus the wish-fulfilment of the sense of guilt reacting on the contemned impulse. But the dreams mentioned above of patients suffering from traumatic neuroses do not permit of classification under the category of wish-fulfilment, nor do the dreams occurring during psycho-analysis that bring back the recollection of the psychic traumata of childhood. They obey rather the repetition-compulsion, which in analysis, it is true, is supported by the (not unconscious) wish to conjure up again what has been forgotten and repressed. Thus the function of the dream, viz. to do away with the motives leading to interruption of sleep by presenting wish-fulfilments of the disturbing excitations, would not be its original one; the dream could secure control of this function only after the whole psychic life had accepted the domination of the pleasure-principle. If there is a 'beyond the pleasure-principle' it is logical to admit a prehistoric past also for the wish-fulfilling tendency of the dream, though to do so is no contradiction of its later function. Now, when this tendency is once broken through, there arises the further question: are such dreams, which in the interests of the psychical binding of traumatic impressions follow the repetition-compulsion, not possible apart from analysis? The answer is certainly in the affirmative.

With regard to the war neuroses, so far as the term has any significance apart from a reference to the occasion of the appearance of the illness, I have explained elsewhere that they might very well be traumatic neuroses which have arisen the more easily on account of an ego-conflict. [5] The fact mentioned above, viz. that a severe injury inflicted at the same time by the trauma lessens the chance of a neurosis arising, is no longer difficult to

understand if two circumstances emphasised by psycho-analytic research are borne in mind. First that mechanical concussion must be recognised as one of the sources of sexual excitation (cp. the remarks: ‘The effects of swinging and railway travelling’ in Drei Abhandlungen zur Sexualtheorie, 4. Auflage 1920); and, secondly, that a painful and feverish illness exerts for the time it lasts a powerful influence on the distribution of the libido. Thus the mechanical force of the trauma would set free the quota of sexual excitation which, in consequence of the lacking preparation by apprehension, has a traumatic effect: but, on the other hand, the contemporaneous bodily injury would bind the surplus excitation by the putting in of a claim to a narcissistic over-charging of the injured part (see ‘Zur Einführung des Narzissmus’, Sammlung kleiner Schriften zur Neurosenlehre, IV. Folge, 1918). It is also known, though the idea has not been sufficiently made use of in the Libido theory, that disturbances in the distribution of the libido so severe as those of melancholia may be removed for a time by an intercurrent organic disease; in fact even the condition of a fully developed dementia praecox is capable of a transitory improvement in these circumstances.

ENDNOTES.

V

THE FACT that the sensitive cortical layer has no protective barrier against excitations emanating from within will have one inevitable consequence: viz. that these transmissions of stimuli acquire increased economic significance and frequently give rise to economic disturbances comparable to the traumatic neuroses. The most prolific sources of such inner excitations are the so-called instincts of the organism, the representatives of all forces arising within the body and transmitted to the psychic apparatus — the most important and most obscure element in psychological research.

Perhaps we shall not find it too rash an assumption that the excitations proceeding from the instincts do not conform to the type of the ‘bound’ but of the free-moving nerve processes that are striving for discharge. The most trustworthy knowledge we have of these processes comes from the study of dreams. There we found that the processes in the unconscious systems are fundamentally different from those in the (pre)conscious; that in the unconscious ‘charges’ may easily be completely transferred, displaced or condensed, while if this happened with preconscious material only defective results would be obtained. This is the reason for the well-known peculiarities of the manifest dream, after the preconscious residues of the day before have undergone elaboration according to the laws of the unconscious. I termed this kind of process in the unconscious the psychic ‘primary process’ in contradistinction to the secondary process valid in our normal waking life. Since the excitations of instincts all affect the unconscious systems, it is scarcely an innovation to say that they follow the lines of the primary process, and little more so to identify the psychic primary process with the freely mobile charge, the secondary process with changes in Breuer’s bound or tonic charge. [1] It would then be the task of the higher layers of the psychic apparatus to bind the instinct-excitation that reaches the primary process. The failure to effect this binding would evoke a disturbance analogous to the traumatic neuroses; it is only after the binding had been successfully accomplished that the pleasure-principle (and its modification the reality-principle) would have an opportunity to assert its sway without hindrance. Till then, the other task of the psychic apparatus would take precedence, viz. to obtain control of or to bind the

excitation, not in opposition to the pleasure-principle but independently of it and in part without regard to it.

The expressions of a repetition-compulsion which we have described, both in the early activities of infantile psychic life and in the experiences of psychoanalytic treatment, show in a high degree an instinctive character, and, where they come into contrast with the pleasure-principle, a daemonic character. In the play of children we seem to arrive at the conclusion that the child repeats even the unpleasant experiences because through his own activity he gains a far more thorough mastery of the strong impression than was possible by mere passive experience. Every fresh repetition seems to strengthen this mastery for which the child strives; even with pleasurable experiences the child cannot do enough in the way of repetition and will inexorably insist on the identity of the impression. This characteristic is destined later to disappear. A witticism heard for the second time will almost fail of effect; a theatrical performance will never make the same impression the second time that it did on the first occasion; indeed it is hard to persuade the adult to read again at all soon a book he has enjoyed. Novelty is always the necessary condition of enjoyment. The child, however, never gets tired of demanding from a grown-up the repetition of a game he has played with him before or has shown him, till at last the grown-up refuses, utterly worn out; similarly if he has been told a pretty story, he wants always to hear the same story instead of a new one, insists inexorably on exact repetition and corrects each deviation which the narrator lets slip by mistake, which perhaps he even thought to gain new merit by inserting. Here there is no contradiction of the pleasure-principle: it is evident that the repetition, the rediscovery of the identity, is itself a source of pleasure. In the case of a patient in analysis, on the other hand, it is plain that the compulsion to repeat in the transference the occurrences of his infantile life disregards *in every way* the pleasure-principle. The patient behaves in this respect completely like a child, and thus makes it clear to us that the repressed memory-traces of his primitive experience are not present in a ‘bound’ form, are indeed, in a sense, not capable of the secondary process. To this fact of their not being bound they owe their power to weave a wish-phantasy that will be represented in a dream, by adhering to the residues from waking experiences. We frequently encounter the same repetition-compulsion as a therapeutic obstacle, when at the end of the treatment we

wish to bring about complete detachment from the physician; and it may be supposed that the vague dread with which those who are unfamiliar with it view analysis, as though they feared to wake what they think is better left to sleep, is at root a fear of the appearance of this daemonic compulsion.

In what way is the instinctive connected with the compulsion to repetition? At this point the idea is forced upon us that we have stumbled on the trace of a general and hitherto not clearly recognised — or at least not expressly emphasised — characteristic of instinct, perhaps of all organic life. According to this, *an instinct would be a tendency innate in living organic matter impelling it towards the reinstatement of an earlier condition,* one which it had to abandon under the influence of external disturbing forces — a kind of organic elasticity, or, to put it another way, the manifestation of inertia in organic life. [2]

This conception of instinct strikes us as strange, since we are accustomed to see in instinct the factor urging towards change and development, and now we find ourselves required to recognise in it the very opposite, viz. the expression of the conservative nature of living beings. On. the other hand, we soon think of those examples in animal life which appear to confirm the idea of instinct having been historically conditioned. When certain fish undertake arduous journeys at spawning-time, in order to deposit the spawn in certain definite waters far removed from their usual habitats, according to the interpretation of many biologists they are only seeking the earlier homes of their kind, which in course of time they have exchanged for others. The same is said to be true of the migratory flights of birds of passage, but the search for further examples becomes superfluous when we remember that in the phenomena of heredity and in the facts of embryology we have the most imposing proofs of the organic compulsion to repetition. We see that the germ cell of a living animal is obliged to repeat in its development — although in a fleeting and curtailed fashion — the structures of all the forms from which the animal is descended, instead of hastening along the shortest path to its own final shape. A mechanical explanation of this except in some trifling particulars is impossible, and the historical explanation cannot be disregarded. In the same way we find extending far upwards in the animal kingdom a power of reproduction whereby a lost organ is replaced by the growth of a new one exactly like it.

The obvious objection, that it may well be that besides the conservative instincts compelling repetition there are others which press towards new formation and progress, should certainly not be left unnoticed; it will be considered at a later stage of our discussion. But we may first be tempted to follow to its final consequences the hypothesis that all instincts have as their aim the reinstatement of an earlier condition. If what results gives an appearance of ‘profundity’ or bears a resemblance to mysticism, still we know ourselves to be clear of the reproach of having striven after anything of the sort. We are in search of sober results of investigation or of reflections based upon it, and the only character we wish for in these results is that of certainty.

If then all organic instincts are conservative, historically acquired, and are directed towards regression, towards reinstatement of something earlier, we are obliged to place all the results of organic development to the credit of external, disturbing and distracting influences. The rudimentary creature would from its very beginning not have wanted to change, would, if circumstances had remained the same, have always merely repeated the same course of existence. But in the last resort it must have been the evolution of our earth, and its relation to the sun, that has left its imprint on the development of organisms. The conservative organic instincts have absorbed everyone of these enforced alterations in the course of life and have stored them for repetition; they thus present the delusive appearance of forces striving after change and progress, while they are merely endeavouring to reach an old goal by ways both old and new. This final goal of all organic striving can be stated too. It would be counter to the conservative nature of instinct if the goal of life were a state never hitherto reached. It must rather be an ancient starting point, which the living being left long ago, and to which it harks back again by all the circuitous paths of development. If we may assume as an experience admitting of no exception that everything living dies from causes within itself, and returns to the inorganic, we can only say *‘The goal of all life is death’*, and, casting back, *‘The inanimate was there before the animate.’*

At one time or another, by some operation of force which still completely baffles conjecture, the properties of life were awakened in lifeless matter. Perhaps the process was a prototype resembling that other one which later in a certain stratum of living matter gave rise to consciousness. The tension then aroused in the previously inanimate

matter strove to attain an equilibrium; the first instinct was present, that to return to lifelessness. The living substance at that time had death within easy reach; there was probably only a short course of life to run, the direction of which was determined by the chemical structure of the young organism. So through a long period of time the living substance may have been constantly created anew, and easily extinguished, until decisive external influences altered in such a way as to compel the still surviving substance to ever greater deviations from the original path of life, and to ever more complicated and circuitous routes to the attainment of the goal of death. These circuitous ways to death, faithfully retained by the conservative instincts, would be neither more nor less than the phenomena of life as we now know it. If the exclusively conservative nature of the instincts is accepted as true, it is impossible to arrive at any other suppositions with regard to the origin and goal of life.

If these conclusions sound strangely in our ears, equally so will those we are led to make concerning the great groups of instincts which we regard as lying behind the vital phenomena of organisms. The postulate of the self-preservative instincts we ascribe to every living being stands in remarkable contrast to the supposition that the whole life of instinct serves the one end of bringing about death. The theoretic significance of the instincts of self-preservation, power and self-assertion, shrinks to nothing, seen in this light; they are part-instincts designed to secure the path to death peculiar to the organism and to ward off possibilities of return to the inorganic other than the immanent ones, but the enigmatic struggle of the organism to maintain itself in spite of all the world, a struggle that cannot be brought into connection with anything else, disappears. It remains to be added that the organism is resolved to die only in its own way; even these watchmen of life were originally the myrmidons of death. Hence the paradox comes about that the living organism resists with all its energy influences (dangers) which could help it to reach its life-goal by a short way (a short circuit, so to speak); but this is just the behaviour that characterises a pure instinct as contrasted with an intelligent striving. [3]

But we must bethink ourselves: this cannot be the whole truth. The sexual instincts, for which the theory of the neuroses claims a position apart, lead us to quite another point of view. Not all organisms have yielded to the external compulsion driving them to an ever further development. Many have succeeded in maintaining themselves on their

low level up to the present time: there are in existence to-day, if not all, at all events many forms of life that must resemble the primitive stages of the higher animals and plants. And, similarly, not all the elementary organisms that make up the complicated body of a higher form of life take part in the whole path of evolution to the natural end, i.e. death. Some among them, the reproductive cells, probably retain the original structure of the living substance and, after a given time, detach themselves from the parent organism, charged as they are with all the inherited and newly acquired instinctive dispositions. Possibly it is just those two features that make their independent existence possible. If brought under favourable conditions they begin to develop, that is, to repeat the same cycle to which they owe their origin, the end being that again one portion of the substance carries through its development to a finish, while another part, as a new germinal core, again harks back to the beginning of the development. Thus these reproductive cells operate against the death of the living substance and are able to win for it what must seem to us to be potential immortality, although perhaps it only means a lengthening of the path to death. Of the highest significance is the fact that the reproductive cell is fortified for this function, or only becomes capable of it, by the mingling with another like it and yet different from it.

There is a group of instincts that care for the destinies of these elementary organisms which survive the individual being, that concern themselves with the safe sheltering of these organisms as long as they are defenceless against the stimuli of the outer world, and finally bring about their conjunction with other reproductive cells. These are collectively the sexual instincts. They are conservative in the same sense as the others are, in that they reproduce earlier conditions of the living substance, but they are so in a higher degree in that they show themselves specially resistant to external influences; and they are more conservative in a wider sense still, since they preserve life itself for a longer time. They are the actual life-instincts; the fact that they run counter to the trend of the other instincts which lead towards death indicates a contradiction between them and the rest, one which the theory of neuroses has recognised as full of significance. There is as it were an oscillating rhythm in the life of organisms: the one group of instincts presses forward to reach the final goal of life as quickly as possible, the other flies back at a certain point on the way only to traverse the same stretch once more from a given spot and

thus to prolong the duration of the journey. Although sexuality and the distinction of the sexes certainly did not exist at the dawn of life, nevertheless it remains possible that the instincts which are later described as sexual were active from the very beginning and took up the part of opposition to the role of the ‘ego-instincts’ then, and not only at some later time.

Let us now retrace our steps for the first time, to ask whether all these speculations are not after all without foundation. Are there really, *apart from the sexual instincts,* no other instincts than those which have as their object the reinstatement of an earlier condition, none that strive towards a condition never yet attained? I am not aware of any satisfactory example in the organic world running counter to the characteristic I have suggested. The existence of a general impulse towards higher development in the plant and animal world can certainly not be established, though some such line of development is as a fact unquestionable. But, on the one hand, it is often merely a question of our own valuation when we pronounce one stage of development to be higher than another, and, on the other hand, biology makes clear to us that a higher development in one particular is often purchased with, or balanced by, retrogression in another. Then there are plenty of animal forms the youthful stages of which teach us that their development has taken a retrograde character rather than otherwise. Higher development and retrogression alike might well be the results of external forces impelling towards adaptation, and the part played by the instincts might be confined in both cases to retaining the enforced changes as sources of pleasure. [4]

Many of us will also find it hard to abandon our belief that in man himself there dwells an impulse towards perfection, which has brought him to his present heights of intellectual prowess and ethical sublimation, and from which it might be expected that his development into superman will be ensured. But I do not believe in the existence of such an inner impulse, and I see no way of preserving this pleasing illusion. The development of man up to now does not seem to me to need any explanation differing from that of animal development, and the restless striving towards further perfection which may be observed in a minority of human beings is easily explicable as the result of that repression of instinct upon which what is most valuable in human culture is built. The repressed instinct never ceases to strive after its complete satisfaction

which would consist in the repetition of a primary experience of satisfaction: all substitution- or reaction-formations and sublimations avail nothing towards relaxing the continual tension; and out of the excess of the satisfaction demanded over that found is born the driving momentum which allows of no abiding in any situation presented to it, but in the poet's words 'urges ever forward, ever unsubdued' (Mephisto in 'Faust', Act I. Faust's study). The path in the other direction, back to complete satisfaction, is as a rule barred by the resistances that maintain the repressions, and thus there remains nothing for it but to proceed in the other, still unobstructed direction, that of development, without, however, any prospect of being able to bring the process to a conclusion or to attain the goal. What occurs in the development of a neurotic phobia, which is really nothing but an attempt at flight from the satisfaction of an instinct, gives us the prototype for the origin of this ostensible 'impulse towards perfection' which, however, we cannot possibly ascribe to all human beings. The dynamic conditions are, it is true, quite generally present, but the economic relations seem only in rare cases to favour the phenomenon.

ENDNOTES.

[1] Cp. Section VII, 'Psychology of the Dream-Processes' in my 'Traumdeutung'.

[2] I have little doubt that similar conjectures about the nature of instinct have been already repeatedly put forward.

[3] Compare the subsequent criticism of this extreme view of the self-preservative instincts.

[4] By a different route Ferenczi has arrived at the possibility of this conception. ('Stages of Development in the Sense of Reality'. Ch. VIII of his Contributions to Psycho-Analysis, 1916.) He writes: 'By following through this process of thought logically one is obliged to gain familiarity with the idea of a tendency to persistence or regression governing organic life also, while the tendency to progress in development, adaptation, etc. is manifested only as against external stimuli.'

VI

OUR discussion so far results in the establishing of a sharp antithesis between the ‘ego-instincts’ and the sexual instincts, the former impelling towards death and the latter towards the preservation of life, a result which we ourselves must surely find in many respects far from adequate. Further, only for the former can we properly claim the conservative — or, better, regressive — character corresponding to a repetition-compulsion. For according to our hypothesis the ego-instincts spring from the vitalising of inanimate matter, and have as their aim the reinstatement of lifelessness. As to the sexual instincts on the other hand: it is obvious that they reproduce primitive states of the living being, but the aim they strive for by every means is the union of two germ cells which are specifically differentiated. If this union does not take place, then the germ cell dies like all other elements of the multicellular organism. Only on this condition can the sexual function prolong life and lend it the semblance of immortality. Of what important happening then in the process of development of the living substance is sexual reproduction, or its forerunner, the copulation of two individual protozoa, the repetition? That question we do not know how to answer, and therefore we should feel relieved if the whole structure of our arguments were to prove erroneous. The opposition of ego- (or death-) instincts and sexual (life-) instincts would then disappear, and the repetition-compulsion would thereupon also lose the significance we have attributed to it.

Let us turn back therefore to one of the assumptions we interpolated, in the expectation that it will permit of exact refutation. We built up further conclusions on the basis of the assumption that all life must die from internal causes. We made this assumption so light-heartedly because it does not seem to us to be one. We are accustomed so to think, and every poet encourages us in the idea. Perhaps we have resolved so to think because there lies a certain consolation in this belief. If man must himself die, after first losing his most beloved ones by death, he would prefer that his life be forfeit to an inexorable law of nature, the sublime [Greek], than to a mere accident which perhaps could have been in some way avoided. But perhaps this belief in the incidence of death as the necessary consequence of an inner law of being is also only one of those illusions that we have fashioned for ourselves ‘so as to endure the burden of

existence’. It is certainly not a primordial belief: the idea of a ‘natural death’ is alien to primitive races; they ascribe every death occurring among themselves to the influence of an enemy or an evil spirit. So let us not neglect to turn to biological science to test the belief.

If we do so, we may be astonished to find how little agreement exists among biologists on the question of natural death, that indeed the very conception of death altogether eludes them. The fact of a certain average length of life, at least among the higher animals, is of course an argument for death from inner causes, but the circumstance that certain large animals and giant trees reach a very great age, one not to be computed up to now, once more removes this impression. According to the grandiose conception of W. Fliess all the vital phenomena — and certainly also death — are linked with the accomplishment of certain periods of time, among which there finds expression the dependence of two living substances, one male and one female, upon the solar year. But observations of how easily and extensively the influences of external forces can alter vital manifestations, especially in the plant world, as to their occurrence in time, can hasten or retard them, militate against the rigidity of the formulae laid down by Fliess and leaves at least doubtful the universality of the laws he sought to establish.

The treatment of these themes, death and the duration of life among organisms, in the works of A. Weismann [1] possesses the greatest interest for us. This investigator originated the distinction of living substance into a mortal and an immortal half; the mortal is the body in the narrower sense, the soma, which alone is subject to natural death; while the germ cells are potentially immortal, in so far as they are capable under certain favourable conditions of developing into a new individual, or expressed otherwise, of surrounding themselves with a new soma. [2]

What here arrests our attention is the unexpected analogy with our conception developed along so different a line of thought. Weismann, who is considering living substance morphologically, recognises in it a constituent which is the prey of death, the soma, the body viewed apart from sex or heredity elements, and, on the other hand, an immortal part, the germ-plasm, which serves the purpose of preservation of the species, of propagation. We have fixed our attention not on the living matter, but on the forces active in it, and have been led to distinguish two kinds of instincts: those the purpose of which is to guide life towards death, and the

others, the sexual instincts, which perpetually strive for, and bring about, the renewal of life. This sounds like a dynamic corollary to Weismann's morphological theory.

This appearance of an important correspondence vanishes as soon as we examine Weismann's pronouncement on the problem of death. For Weismann admits the differentiation between the mortal soma and the immortal germ-plasm only in relation to multicellular organisms; with the unicellular beings the individual and the reproductive cell are still one and the same. [3] The unicellular he thus affirms to be potentially immortal; death appears only among the metazoa, the multicellular. This death of the higher organisms is, it is true, a natural one, a death from inner causes, but it does not depend on an inherent quality of the living substance, [4] is not to be conceived as an absolute necessity based on the nature of life. [5] Death is rather a purposive contrivance, a phenomenon of adaptation to the external conditions of life, because after the differentiation of the corporeal cells into soma and germ-plasm the indefinite prolongation of the life of the individual would have become a quite inexpedient luxury. With the appearance of this differentiation among multicellular organisms death became possible and expedient. Since then the soma of the higher organisms dies after a certain time from internal causes; the protozoa, however, remain immortal. Propagation, on the other hand, was not first introduced with death; it is on the contrary a primordial property of living matter like growth, in which it originated, and life has gone on uninterruptedly from its inception on the earth. [6]

It is easy to see that to concede natural death to the higher organisms does not greatly help our case. If death is a late acquisition of life, then death-instincts traceable to the beginning of life on this planet no longer come into question. Multicellular organisms may continue to die from internal causes, whether defect of differentiation or imperfections of their metabolism; it possesses no interest for the inquiry on which we are engaged. Such a conception and derivation of death certainly more nearly approaches the ordinary human view of it than the unwonted assumption of 'death-instincts'.

The discussion which has centred round Weismann's assertations has in my opinion had no decisive result in any direction. [7] Many writers have reverted to the standpoint of Goette (1883) who saw in death the direct consequence of propagation. Hartmann does not regard as the

characteristic of death the appearance of a ‘corpse’, a piece of living substance which has ‘died off’, but defines it as the ‘definitive end of individual development’. In this sense protozoa are also subject to death; with them death invariably coincides with propagation, but it is, so to speak, disguised by the latter, for the whole substance of the parent organism may be absorbed directly into the new individuals. [8]

The interest of the inquiry was soon directed towards testing experimentally the asserted immortality of living substance in unicellular beings. An American, named Woodruff, instituted a culture of a ciliated infusorium, a ‘slipper-animalcule’, which reproduces itself by division into two individuals; each time he isolated one of the products and put it into fresh water. He traced the propagation to the 3,029th generation, when he discontinued the experiment. The last descendant of the first slipper-animalcule was just as lively as its original ancestor, without any sign of age or degeneration: if such numbers are convincing, the immortality of protozoa seemed thus experimentally demonstrable. [9]

Other investigators have arrived at other results. Maupas, Calkins, etc., found, in contradiction to Woodruff, that even these infusoria after a certain number of divisions become weaker, decrease in size, lose a portion of their organisation, and finally die if they do not encounter certain invigorating influences. According to this, protozoa die after a phase of senile decay just like higher animals, in direct contravention of what is maintained by Weismann, who recognises in death a late acquisition of living organisms.

Taking the net result of these researches together, we note two facts which seem to afford us a firm foothold. First: if the animalculae, at a time when they as yet show no signs of age, have the opportunity of mingling with each other, of ‘conjugating’ — afterwards again separating — then they remain exempt from age, they have been ‘rejuvenated’. This conjugation is doubtless the prototype of sexual propagation of higher organisms: as yet it has nothing to do with multiplication, it is confined to the mingling of the substances of both individuals (Weismann’s Amphimixis). The invigorating influence of conjugation can also be replaced, however, by certain modes of stimulation, changes in the composition of the nutrient fluid, raising of temperature, or shaking. The famous experiment of J. Loeb will be recalled, who by the application of

certain chemical stimuli to the ova of sea-urchins brought about processes of division which usually take place only after fertilisation.

Secondly: it is after all probable that the infusoria are brought to a natural death through their own vital process, for the contradiction between Woodruff's findings and those of others arises from Woodruff having placed each generation in fresh nutrient fluid. When he refrained from doing so he observed, as did the other investigators, that the generations showed signs of age. He concluded that the animalculae were injured by the products of metabolism which they gave off into the surrounding fluid, and was then able to prove convincingly that only the products of *its own* metabolism had this effect in bringing about the death of the generation. For in a solution over-saturated with waste products of a distantly related species the very same animalculae throve excellently which when allowed to accumulate in their own nutrient fluid inevitably perished. Thus, left to itself, the infusorium dies a natural death from the imperfect disposal of its own metabolic products: perhaps all higher animals die ultimately from the same inability.

At this point the doubt may then occur to us whether any good purpose has been served in looking for the answer to the question as to natural death in the study of the protozoa. The primitive organisation of these forms of life may conceal from us important conditions which are present in them too, but can be recognised only among the higher animals where they have achieved for themselves a morphological expression. If we abandon the morphological point of view for the dynamic, it may be a matter of entire indifference to us whether the natural death of the protozoa can be proved or not. With them the substance later recognised as immortal has not yet separated itself in any way from the part subject to death. The instinctive forces which endeavour to conduct life to death might be active in them too from the beginning and yet their effect might be so obscured by that of the forces tending to preserve life that any direct evidence of their existence becomes hard to establish. We have heard, it is true, that the observations of biologists allow us to assume such death-ward tending inner processes also among the protozoa. But even if the protozoa prove to be immortal in Weismann's sense, his assertion that death is a late acquisition holds good only of the outward manifestations of death, and does not invalidate any hypothesis as to such processes as impel towards death. Our expectation that biology would entirely put out

of court any recognition of the death-instincts has not been fulfilled. It is open to us to occupy ourselves further with this possibility, if we have other reasons for doing so. The striking resemblance between Weismann's separation of soma and germ-plasm and our distinction between the death and the life-instincts remains unshaken, moreover, and retains its value.

Let us dwell for a moment on this exquisitely dualistic conception of the instinctive life. According to E. Hering's theory of the processes in living matter there course through it uninterruptedly two kinds of processes of opposite direction, one anabolic, assimilatory, the other katabolic, disintegrating. Shall we venture to recognise in these two directions of the vital processes the activity of our two instinctive tendencies, the life-instincts and the death-instincts? And we cannot disguise another fact from ourselves, that we have steered unawares into the haven of Schopenhauer's philosophy for whom death is the 'real result' of life [10] and therefore in so far its aim, while the sexual instinct is the incarnation of the will to live.

Let us boldly try to go a step further. According to general opinion the union of numerous cells into one vital connection, the multicellularity of organisms, has become a means to the prolongation of their span of life. One cell helps to preserve the life of the others, and the cell-community can go on living even if single cells have to perish. We have already heard that also conjugation, the temporary mingling of two unicellular entities, has a preservative and rejuvenating effect on both. The attempt might consequently be made to transfer the Libido theory yielded by psychoanalysis to the relationship of the cells to one another and to imagine that it is the vital or sexual instincts active in every cell that take the other cells for their 'object', partially neutralise their death-instincts, i. e. the processes stimulated by these, and so preserve those cells in life, while other cells do the same for them, and still others sacrifice themselves in the exercise of this libidinous function. The germ cells themselves would behave in a completely 'narcissistic' fashion, as we are accustomed to describe it in the theory of the neuroses when an individual concentrates his libido on the ego, and gives out none of it for the charging of objects. The germ cells need their libido — the activity of their vital instincts — for themselves as a provision for their later enormous constructive activity. Perhaps the cells of the malignant growths that destroy the organism can also be considered to be narcissistic in the same

sense. Pathology is indeed prepared to regard the kernels of them as congenital in origin and to ascribe embryonal attributes to them. Thus the Libido of our sexual instincts would coincide with the Eros of poets and philosophers, which holds together all things living.

At this point opportunity offers of reviewing the gradual development of our Libido theory. The analysis of the transference-neuroses forced on our notice in the first place the opposition between ‘sexual instincts’ which are directed towards an object and other instincts which we only imperfectly discerned and provisionally described as ‘ego-instincts’. Among the latter those which subserve the self-preservation of the individual had the first claim for recognition. What other distinctions were to be made, it was impossible to say. No knowledge would have been so important for the establishment of a sound psychology as some approximate understanding of the common nature and possible differences of the instincts. But in no department of psychology did one grope more in the dark. Everyone posited as many instincts or ‘fundamental instincts’ as he pleased, and contrived with them just as the ancient Greek philosophers did with their four elements: earth, air, fire and water. Psycho-Analysis, which could not dispense with some kind of hypothesis as to the instincts, adhered to begin with to the popular distinction, typically represented by the phrase ‘hunger and love’. It was at least no new arbitrary creation. With this one adequately covered a considerable distance in the analysis of the psychoneuroses. The conception of ‘sexuality’ — and therewith that of a sexual instinct — certainly had to be extended, till it included much that did not come into the category of the function of propagation, and this led to outcry enough in a severe and superior or merely hypocritical world.

The next step followed when Psycho-Analysis was able to feel its way a little nearer to the psychological ego, which was at first known to us only as a repressing, censoring agency, capable of constituting defences and reaction-formations. Critical and other far-seeing minds had indeed for a long time raised objections to the narrowing of the libido concept down to the energy of the sexual instinct as directed to the object. But they omitted to say whence they obtained this fuller comprehension, and failed to deduce anything from it of value for Psycho-Analysis. In the course of more deliberate advance it came under psycho-analytic observation how regularly libido is withdrawn from the object and directed towards the ego (introversion), and through the study of the libido-development of the

child in its earliest phases it became clear that the ego is the true and original reservoir of the libido, which is extended to the object only from this. The ego took its place as one of the sexual objects and was immediately recognised as the choicest among them. Where the libido thus remained attached to the ego it was termed ‘narcissistic’. [11] This narcissistic libido was naturally also the expression of the energy of sexual instincts in the analytical sense which now had to be identified with the ‘instincts of self-preservation’, the existence of which was admitted from the first. Whereupon the original antithesis between the ego-instincts and the sexual instincts became inadequate. A part of the ego-instincts was recognised as libidinous: in the ego sexual instincts were found to be active — probably in addition to others; nevertheless one is justified in saying that the old formula, viz. that a psychoneurosis arises out of a conflict between the ego-instincts and the sexual instincts, contained nothing that we should have to reject to-day. Only, the difference of the two kinds of instincts which was supposed originally to be in some kind of way qualitative has now to be defined otherwise, namely on a topographical basis. In particular the transference neurosis, the real object of psychoanalytic study, is still seen to be the result of a conflict between the ego and libidinous investment of an object.

We are the more compelled now to accentuate the libidinous character of the self-preservative instincts, since we are venturing on the further step of recognising the sexual instinct as the Eros, the all-sustaining, and of deriving the narcissistic libido of the ego from the sum of the libido quantities that bring about the mutual adherence of the somatic cells. But we now find ourselves suddenly confronted with this question: If the self-preservative instincts are also of a libidinous kind, then perhaps we have no other instincts at all than libidinous ones. There are at least no others apparent. In that event we must admit the critics to be in the right who from the first have suspected that psycho-analysis makes sexuality the explanation of everything, or the innovators like Jung who, quickly making up their mind, have used ‘libido’ as a synonym for ‘instinctive force’ in general. Is that not so?

This result was at all events one not intended by us. On the contrary, we took as our starting point a sharp distinction between the ego-instincts (= death-instincts) and the sexual instincts (= life-instincts). We were prepared indeed to reckon even the alleged self-preservative instincts of

the ego among death-instincts, a position which we have since corrected and withdrawn from. Our standpoint was a dualistic one from the beginning, and is so to-day more sharply than before, since we no longer call the contrasting tendencies egoistic and sexual instincts, but life-instincts and death-instincts. Jung's libido theory, on the other hand, is a monistic one; that he has applied the term libido to his only instinctive energy was bound to create confusion, but should not have any further effect on us. We suspect that there are in the ego other instincts than those of self-preservation; only we ought to be in a position to demonstrate them. Unfortunately so little progress has been made in the analysis of the ego that this proof becomes extraordinarily difficult of attainment. The libidinous instincts of the ego may indeed be conjoined in a special way with other ego-instincts of which we as yet know nothing. Before ever we had clearly recognised narcissism, the conjecture was already present in the minds of psychoanalysts that the 'ego-instincts' had drawn libidinous components to themselves. But these are merely vague possibilities which our opponents will hardly take into account. It remains an awkward fact that analysis up to now has only put us in the position of demonstrating libidinous impulses. The conclusion that therefore there are no others is one to which we do not assent.

In the obscurity that at present shrouds the theory of instinct, we shall certainly not do well to reject any idea that promises to throw light. We have made the antithesis between the life and death instincts our point of departure. Object-love itself displays a second such polarity, that of love (tenderness) and hate (aggression). What if we could succeed in bringing these two polarities into relation with each other, in tracing the one to the other! We have long recognised a sadistic component of the sexual instinct: [12] it can, as we know, attain independence, and as a perversion, dominate the whole sexual trend of a person. In one of the organisations which I have termed 'pregenital' it appears as a dominating part-instinct. But how is one to derive the sadistic impulse, which aims at the injury of the object, from the life-sustaining Eros! Does not the assumption suggest itself that this sadism is properly a death-instinct which is driven apart from the ego by the influence of the narcissistic libido, so that it becomes manifest only in reference to the object? It then enters the service of the sexual function; at the oral stage of organisation of the libido, amorous possession is still one and the same as annihilation of the object; later the

sadistic impulse separates itself, and at last at the stage of the genital primacy it takes over with the aim of propagation the function of so far overpowering the sex-object as the carrying out of the sexual act demands. One might even say that the sadism expelled from the ego has acted as guide to the libidinous components of the sexual instinct; these later press on towards the object. Where the original sadism experiences no abatement or fusion, the well-known hate-love ambivalence of the love-life is set up.

If the above assumption is justifiable then we have met the challenge of demonstrating an example of a death-instinct — though a displaced one. This conception, however, is far from being evident, and creates a frankly mystical impression. We incur the suspicion of having attempted at all costs to find a way out of an *impasse*. We may appeal against this verdict by saying that the assumption is no new one, that we have once before made it when there was no question of an *impasse*. Clinical observations forced upon us the view that the part-instinct of masochism, the one complementary to sadism, is to be understood as a recoil of the sadism on to the ego itself. [13] A turning of the instinct from the object to the ego is, however, essentially the same as a turning from the ego to the object, which is just now the new idea in question. Masochism, the turning of the instinct against the self, would then be in reality a return to an earlier phase of this, a regression. The exposition I then gave of masochism needs correction in one respect as being too exclusive: masochism may also be what I was there concerned to deny, primary. [14]

Let us return, however, to the life-sustaining sexual instincts. We have already learned from the investigation of the protozoa that the mingling of two individuals without consequent partition, just as copulation between two individuals which soon after separate, has a strengthening and rejuvenating effect (v. s. Lipschütz). There is no sign of degeneration in their descendents, and they also seem to have gained the capacity for withstanding for a longer time the injurious results of their own metabolism. I think that this one observation may be taken as a prototype of the effect of sexual intercourse also. But in what way does the blending of two slightly different cells bring about such a renewal of life? The experiment which substitutes for conjugation among protozoa the effect of chemical or even of mechanical stimuli [15] admits of our giving a reply with certainty: it comes about by the introduction of new stimulus-masses.

This is in close agreement with the hypothesis that the life-process of an individual leads, from internal causes, to the equalising of chemical tensions: i.e. to death, while union with an individually different living substance increases these tensions — so to speak, introduces new vital differentia, which then have to be again lived out. For this difference between the two there must naturally be one or more optima. Our recognition that the ruling tendency of psychic life, perhaps of nerve life altogether, is the struggle for reduction, keeping at a constant level, or removal of the inner stimulus tension (the Nirvana-principle, as Barbara Low terms it) — a struggle which comes to expression in the pleasure-principle — is indeed one of our strongest motives for believing in the existence of death-instincts.

But the course of our argument is still disturbed by an uneasy feeling that just in the case of the sexual instinct we are unable to demonstrate that character of a repetition-compulsion which first put us on the track of the death-instincts. It is true that the realm of embryonic developmental processes offers an abundance of such repetition phenomena — the two germ cells of sexual propagation and their life-history are themselves only repetitions of the beginning of organic life: but the essential feature in the processes designed by the sexual instinct is nevertheless the mingling of two cells. Only by this is the immortality of the living substance among the higher forms of life assured.

To put it in other words: we have to make enquiry into the origin of sexual propagation and the source of the sexual instincts in general, a task before which the lay mind quails and which even specialists have not yet been able to solve. Let us, therefore, make a condensed selection from all the conflicting accounts and opinions of whatever can be brought into relation with our train of thought.

One view deprives the problem of propagation of its mysterious attraction by representing it as part of the phenomenon of growth (multiplication by division, germination, budding). The arising of propagation by means of germ-cells sexually differentiated might be conceived, in accordance with the sober Darwinian mode of thought, as a way of maintaining and utilising for further development the advantage of the amphimixis which resulted in the first instance from the fortuitous conjugation of two protozoa. [16] ‘Sex’ would not thus be of very ancient origin and the extraordinarily powerful instincts which aim at bringing

about sexual union would thereby repeat something which once chanced to happen and since became established as being advantageous.

The same question now recurs as arose in respect of death — namely, whether the protozoa can be credited with anything beyond what they exhibit, and whether we may assume that forces and processes which become perceptible only in the case of the higher animals did first arise in the more primitive. For our purpose the view of sexuality mentioned above helps very little. The objection may be raised against it that it presupposes the existence of life-instincts as already operative in the simplest forms of life, for otherwise conjugation, which works against the expiration of life and makes the task of dying harder, would not have been retained and elaborated, but would have been avoided. If, then, we are not to abandon the hypothesis of death-instincts maintained, we must associate them with life-instincts from the beginning. But we must admit that we are working here at an equation with two unknown quantities. Anything else that science can tell us of the origin of sexuality amounts to so little that this problem may be likened to an obscurity into which not even the ray of an hypothesis has penetrated. In quite another quarter, however, we encounter such an hypothesis, but it is of so fantastic a kind — assuredly a myth rather than a scientific explanation — that I should not venture to bring it forward if it did not exactly fulfil the one condition for the fulfilment of which we are labouring. That is to say, it derives an instinct from the *necessity for the reinstatement of an earlier situation.*

I refer, of course, to the theory that Plato in his Symposium puts into the mouth of Aristophanes and which deals not only with the origin of the sexual instinct but also with its most important variations in relation to the object. ‘Human nature was once quite other than now. Originally there were three sexes, three and not as to-day two: besides the male and the female there existed a third sex which had an equal share in the two first…. In these beings everything was double: thus, they had four hands and four feet, two faces, two genital parts, and so on. Then Zeus allowed himself to be persuaded to cut these beings in two, as one divides pears to stew them…. When all nature was divided in this way, to each human being came the longing for his own other half, and the two halves embraced and entwined their bodies *and desired to grow together again.’* [17]

Are we to follow the clue of the poet-philosopher and make the daring assumption that living substance was at the time of its animation rent into small particles, which since that time strive for reunion by means of the sexual instincts? That these instincts — in which the chemical affinity of inanimate matter is continued — passing through the realm of the protozoa gradually overcome all hindrances set to their striving by an environment charged with stimuli dangerous to life, and are impelled by it to form a protecting covering layer? And that these dispersed fragments of living substance thus achieve a multicellular organisation, and finally transfer to the germ-cells in a highly concentrated form the instinct for reunion? I think this is the point at which to break off.

But not without a few words of critical reflection in conclusion. I might be asked whether I am myself convinced of the views here set forward, and if so how far. My answer would be that I am neither convinced myself, nor am I seeking to arouse conviction in others. More accurately: I do not know how far I believe in them. It seems to me that the affective feature ‘conviction’ need not come into consideration at all here. One may surely give oneself up to a line of thought, and follow it up as far as it leads, simply out of scientific curiosity, or — if you prefer — as advocatus diaboli, without, however, making a pact with the devil about it. I am perfectly aware that the third step in the theory of instinct which I am taking here cannot claim the same certainty as the two former ones, viz. the extending of the conception of sexuality and the establishing of narcissism. These innovations were direct translations of observation into theory, subject to no greater sources of error than is inevitable in anything of the kind. The assertion of the regressive character of instinct rests also, it is true, on observed material, namely on the facts of the repetition-compulsion. But perhaps I have over-estimated their significance. At all events there is no way of working out this idea except by combining facts with pure imagination many times in succession, and thereby departing far from observation. We know that the final result becomes the more untrustworthy the oftener one does this in the course of building up a theory, but the precise degree of uncertainty is not ascertainable. One may thereby have made a brilliant discovery or one may have gone ignominiously astray. In such work I trust little to so-called intuition: what I have seen of it seems to me to be the result of a certain impartiality of the intellect — only that people unfortunately are seldom impartial where

they are concerned with the ultimate things, the great problems of science and of life. My belief is that there everyone is under the sway of preferences deeply rooted within, into the hands of which he unwittingly plays as he pursues his speculation. Where there are such good grounds for distrust, only a tepid feeling of indulgence is possible towards the results of one's own mental labours. But I hasten to add that such self-criticism does not render obligatory any special tolerance of divergent opinions. One may inexorably reject theories that are contradicted by the very first steps in the analysis of observation and yet at the same time be aware that those one holds oneself have only a tentative validity. Were we to appraise our speculations upon the life and death-instincts it would disturb us but little that so many processes go on which are surprising and hard to picture, such as one instinct being expelled by others, or turning from the ego to an object, and so on. This comes only from our being obliged to operate with scientific terms, i. e. with the metaphorical expressions peculiar to psychology (or more correctly: psychology of the deeper layers). Otherwise we should not be able to describe the corresponding processes at all, nor in fact even to have remarked them. The shortcomings of our description would probably disappear if for the psychological terms we could substitute physiological or chemical ones. These too only constitute a metaphorical language, but one familiar to us for a much longer time and perhaps also simpler.

On the other hand we wish to make it quite clear that the uncertainty of our speculation is enhanced in a high degree by the necessity of borrowing from biological science. Biology is truly a realm of limitless possibilities; we have the most surprising revelations to expect from it, and cannot conjecture what answers it will offer in some decades to the questions we have put to it. Perhaps they may be such as to overthrow the whole artificial structure of hypotheses. If that is so, someone may ask why does one undertake such work as the one set out in this article, and why should it be communicated to the world? Well, I cannot deny that some of the analogies, relations and connections therein traced appeared to me worthy of consideration. [18]

[14] A considerable part of this speculation has been anticipated in a work which is full of valuable matter and ideas but is unfortunately not entirely clear to me: (Sabina Spielrein: 'Die Destruktion als Ursache des Werdens', *Jahrbuch für Psychoanalyse,* IV, 1912). She designates the sadistic component as 'destructive'. In still another way A. Stärcke (Inleiding by de vertaling von S. Freud, De sexuele beschavingsmoral etc., 1914) has

attempted to identify the libido concept itself with the biological concept of an impulsion towards death which is to be assumed on theoretical grounds (Cp. also Rank: ‘Der Künstler’). All these attempts, as the one in the text, indicate how much the need is felt for a clarification in the theory of instinct which we do not yet possess.

[15] loc. cit.

[16] Although Weismann (Das Keimplasma, 1892) denies even this advantage: ‘Fertilisation in no way signifies a rejuvenation or renewing of life, — it is in no way necessary for the prolongation of life; it is nothing but a device for making possible the blending of two different inheritance tendencies.’ Still, he considers an increase of variability in living organisms to be the result of such blending.

[17] I am indebted to Prof. Heinrich Gomperz of Vienna for the following indications as to the origin of the Platonic myth, which I repeat partly in his own words: I should like to call attention to the fact that essentially the same theory is also to be found in the Upanishads. The Brihad-Aranyaka Upanishad 1, 4, 3 (Deussen, 60 Upanishads des Veda, S. 393), where the creation of the world from the Âtman (the self or ego) is described, has the following passage ‘Nor did he (the Âtman, the self or ego) experience any joy, and for that reason no one has joy when he is alone. So he longed for a partner. He was as big as a woman and a man together when they embrace. He divided himself into two parts, which made a husband and a wife. This body is therefore one half of the self, according to Yajnavalkya. And for the same reason this empty space here becomes filled by the woman.’

The Brihad-Aranyaka Upanishad is the oldest of all the Upanishads, and no expert authority would date it later than 800 B.C. In opposition to the prevailing opinion I should not like definitely to deny the possibility of Plato having been dependent, even though very indirectly, on these Indian thoughts, for this possibility cannot be absolutely put aside even for the doctrine of re-incarnation. A dependence of this sort, first conveyed through Pythagoras, would scarcely detract from the significance of the coincidence in thought, for Plato would not have adopted any such story conveyed in some way from Oriental traditions, let alone have given it

such an important place, had he not himself felt the truth contained in it to be illuminating.

In an article by K. Ziegler (‘Menschen- und Weltwerden’, *Neue Jahrbücher für das klassische Altertum,* 1913, Band XXXI), which contains a systematic investigation of the thought in question, it is traced back to Babylonian ideas.

[18] I would here subjoin a few words to clarify our nomenclature, one which has undergone a certain development in the course of our discussion. What ‘sexual instincts’ are, we knew through their relation to the sexes and to the function of propagation. We then retained this term when the findings of psycho-analysis compelled us to regard its relation to propagation as less close. With the discovery of narcissistic libido, and the extension of the libido-concept to the individual cells, the sexual instinct became for us transformed into the Eros that endeavours to impel the separate parts of living matter to one another and to hold them together; what is commonly called the sexual instinct appears as that part of the Eros that is turned towards the object. Our speculation then supposes that this Eros is at work from the beginnings of life, manifesting itself as the ‘life-instinct’ in contradistinction to the ‘death-instinct’ which developed through the animation of the inorganic. It endeavours to solve the riddle of life by the hypothesis of these two instincts striving with each other from the very beginning. The transformation which the concept of the ‘ego-instincts’ has undergone is perhaps harder to review. Originally we applied this term to all those instinct-directions — not better known to us — which can be distinguished from the sexual instincts that have the object as their aim, thus contrasting the ego-instincts with the sexual ones, the expression of which is the libido. Later on we approached the analysis of the ego and saw that a part also of the ‘ego-instincts’ is of a libidinous nature, having taken its own self as an object. These narcissistic instincts of self-preservation therefore had now to be reckoned to the libidinous sexual instincts. The contrast between egoistic and sexual instincts was now converted into one between egoistic and object-instincts, both libidinous in nature. In its place, however, arose a new contrast between libidinous (ego and object) instincts and others whose existence can be determined in the ego and can perhaps be detected in the destruction-instincts.

Speculation transforms this contrast into that of life-instincts (Eros) and death-instincts.

VII

IF this attempt to reinstate an earlier condition really is so universal a characteristic of the instincts, we should not find it surprising that so many processes in the psychic life are performed independently of the pleasure-principle. This characteristic would communicate itself to every part-instinct and would in that case concern a harking back to a definite point on the path of development. But all that the pleasure-principle has not yet acquired power over is not therefore necessarily in opposition to it, and we have not yet solved the problem of determining the relation of the instinctive repetition processes to the domination of the pleasure-principle.

We have recognised that one of the earliest and most important functions of the psychic apparatus is to ‘bind’ the instreaming instinctive excitations, to substitute the ‘secondary process’ for the ‘primary process’ dominating them, and to transform their freely mobile energy-charge into a predominantly quiescent (tonic) charge. During this transformation no attention can be paid to the development of ‘pain’, but the pleasure-principle is not thereby annulled. On the contrary, the transformation takes place in the service of the pleasure-principle; the binding is an act of preparation, which introduces and secures its sovereignty.

Let us distinguish function and tendency more sharply than we have hitherto done. The pleasure-principle is then a tendency which subserves a certain function — namely, that of rendering the psychic apparatus as a whole free from any excitation, or to keep the amount of excitation constant or as low as possible. We cannot yet decide with certainty for either of these conceptions, but we note that the function so defined would partake of the most universal tendency of all living matter — to return to the peace of the inorganic world. We all know by experience that the greatest pleasure it is possible for us to attain, that of the sexual act, is bound up with the temporary quenching of a greatly heightened state of excitation. The ‘binding’ of instinct-excitation, however, would be a preparatory function, which would direct the excitation towards its ultimate adjustment in the pleasure of discharge.

In the same connection, the question arises whether the sensations of pleasure and ‘pain’ can emanate as well from the bound as from the ‘unbound’ excitation-processes. It appears quite beyond doubt that the

‘unbound’, the primary, processes give rise to much more intense sensations in both directions than the bound ones, those of the ‘secondary processes’. The primary processes are also the earlier in point of time; at the beginning of mental life there are no others, and we may conclude that if the pleasure-principle were not already in action in respect to them, it would not establish itself in regard to the later processes. We thus arrive at the result which at bottom is not a simple one, that the search for pleasure manifests itself with far greater intensity at the beginning of psychic life than later on, but less unrestrictedly: it has to put up with repeated breaches. At a maturer age the dominance of the pleasure-principle is very much more assured, though this principle as little escapes limitations as all the other instincts. In any case, whatever it is in the process of excitation that engenders the sensations of pleasure and ‘pain’ must be equally in existence when the secondary process is at work as with the primary process.

This would seem to be the place to institute further studies. Our consciousness conveys to us from within not only the sensations of pleasure and ‘pain’, but also those of a peculiar tension, which again may be either pleasurable or painful in itself. Now is it the ‘bound’ and ‘unbound’ energy processes that we have to distinguish from each other by the help of these sensations, or is the sensation of tension to be related to the absolute quantity, perhaps to the level of the charge, while the pleasure-pain series refers to the changes in the quantity of charge in the unit of time? We must also be struck with the fact that the life-instincts have much more to do with our inner perception, since they make their appearance as disturbers of the peace, and continually bring along with them states of tension the resolution of which is experienced as pleasure; while the death-instincts, on the other hand, seem to fulfil their function unostentatiously. The pleasure-principle seems directly to subserve the death-instincts; it keeps guard, of course, also over the external stimuli, which are regarded as dangers by both kinds of instincts, but in particular over the inner increases in stimulation which have for their aim the complication of the task of living. At this point innumerable other questions arise to which no answer can yet be given. We must be patient and wait for other means and opportunities for investigation. We must hold ourselves too in readiness to abandon the path we have followed for a time, if it should seem to lead to no good result. Only such ‘true believers’

as expect from science a substitute for the creed they have relinquished will take it amiss if the investigator develops his views further or even transforms them.

For the rest we may find consolation in the words of a poet for the slow rate of progress in scientific knowledge:

Whither we cannot fly, we must go limping.

* * * * *

The Scripture saith that limping is no sin. [1]

ENDNOTES.

GROUP PSYCHOLOGY AND THE ANALYSIS OF THE EGO

Translated by James Strachey

First appearing in 1921, this monograph describes psychological mechanisms at work within mass movements. A mass, according to Freud, is a “temporary entity, consisting of heterogeneous elements that have joined together for a moment.” Freud refers heavily to the writings of sociologist and psychologist Gustave Le Bon (1841-1931), summarising his work in the chapter *Le Bons Schilderung der Massenseele*. Like Le Bon, Freud argues that as part of the mass, the individual acquires a sense of infinite power that allows him to act on impulses that he would otherwise have to curb as an isolated individual. These feelings of power and security enable the individual not only to act as part of the mass, but also to feel safety in numbers. This is accompanied, however, by a loss of conscious personality and a tendency of the individual to be infected by any emotion within the mass, and to amplify the emotion, in turn, by “mutual induction”. Overall, Freud states that the mass is “impulsive, changeable, and irritable. It is controlled almost exclusively by the unconscious.”

Freud distinguishes between two types of masses. One is the short-lived kind, characterised by a rapidly transient interest, such as trends. The other kind consists of more permanent and enduring masses, which are highly organised, such as the Church or the military. “The masses of the former type, so to speak, ride on the latter, like the short but high waves on the long swell of the sea.” However, the same basic mental processes operate in both kinds of masses. Freud refers back to his theory of instincts and believes that masses are held together by libidinal bonds. Each individual in the mass acts on impulses of love that are diverted from their original objectives. They pursue no direct sexual goal, but “do not therefore work less vigorously”.

I. INTRODUCTION

The contrast between Individual Psychology and Social or Group Psychology, which at a first glance may seem to be full of significance, loses a great deal of its sharpness when it is examined more closely. It is true that Individual Psychology is concerned with the individual man and explores the paths by which he seeks to find satisfaction for his instincts; but only rarely and under certain exceptional conditions is Individual Psychology in a position to disregard the relations of this individual to others. In the individual's mental life someone else is invariably involved, as a model, as an object, as a helper, as an opponent, and so from the very first Individual Psychology is at the same time Social Psychology as well — in this extended but entirely justifiable sense of the words.

The relations of an individual to his parents and to his brothers and sisters, to the object of his love, and to his physician — in fact all the relations which have hitherto been the chief subject of psycho-analytic research — may claim to be considered as social phenomena; and in this respect they may be contrasted with certain other processes, described by us as 'narcissistic', in which the satisfaction of the instincts is partially or totally withdrawn from the influence of other people. The contrast between social and narcissistic — Bleuler would perhaps call them 'autistic' — mental acts therefore falls wholly within the domain of Individual Psychology, and is not well calculated to differentiate it from a Social or Group Psychology.

The individual in the relations which have already been mentioned — to his parents and to his brothers and sisters, to the person he is in love with, to his friend, and to his physician — comes under the influence of only a single person, or of a very small number of persons, each one of whom has become enormously important to him. Now in speaking of Social or Group Psychology it has become usual to leave these relations on one side and to isolate as the subject of inquiry the influencing of an individual by a large number of people simultaneously, people with whom he is connected by something, though otherwise they may in many respects be strangers to him. Group Psychology is therefore concerned with the individual man as a member of a race, of a nation, of a caste, of a profession, of an institution, or as a component part of a crowd of people

who have been organised into a group at some particular time for some definite purpose. When once natural continuity has been severed in this way, it is easy to regard the phenomena that appear under these special conditions as being expressions of a special instinct that is not further reducible, the social instinct (‘herd instinct’, ‘group mind’), which does not come to light in any other situations. But we may perhaps venture to object that it seems difficult to attribute to the factor of number a significance so great as to make it capable by itself or arousing in our mental life a new instinct that is otherwise not brought into play. Our expectation is therefore directed towards two other possibilities: that the social instinct may not be a primitive one and insusceptible of dissection, and that it may be possible to discover the beginnings of its development in a narrower circle, such as that of the family.

Although Group Psychology is only in its infancy, it embraces an immense number of separate issues and offers to investigators countless problems which have hitherto not even been properly distinguished from one another. The mere classification of the different forms of group formation and the description of the mental phenomena produced by them require a great expenditure of observation and exposition, and have already given rise to a copious literature. Anyone who compares the narrow dimensions of this little book with the extent of Group Psychology will at once be able to guess that only a few points chosen from the whole material are to be dealt with here. And they will in fact only be a few questions with which the depth-psychology of psycho-analysis is specially concerned.

II. LE BON'S DESCRIPTION OF THE GROUP MIND

Instead of starting from a definition, it seems more useful to begin with some indication of the range of the phenomena under review, and to select from among them a few specially striking and characteristic facts to which our inquiry can be attached. We can achieve both of these aims by means of quotation from Le Bon's deservedly famous work *Psychologie des foules*.

Let us make the matter clear once again. If a Psychology, concerned with exploring the predispositions, the instincts, the motives and the aims of an individual man down to his actions and his relations with those who are nearest to him, had completely achieved its task, and had cleared up the whole of these matters with their inter-connections, it would then suddenly find itself confronted by a new task which would lie before it unachieved. It would be obliged to explain the surprising fact that under a certain condition this individual whom it had come to understand thought, felt, and acted in quite a different way from what would have been expected. And this condition is his insertion into a collection of people which has acquired the characteristic of a 'psychological group'. What, then, is a 'group'? How does it acquire the capacity for exercising such a decisive influence over the mental life of the individual? And what is the nature of the mental change which it forces upon the individual?

It is the task of a theoretical Group Psychology to answer these three questions. The best way of approaching them is evidently to start with the third. Observation of the changes in the individual's reactions is what provides Group Psychology with its material; for every attempt at an explanation must be preceded by a description of the thing that is to be explained.

I will now let Le Bon speak for himself. He says: 'The most striking peculiarity presented by a psychological group is the following. Whoever be the individuals that compose it, however like or unlike be their mode of life, their occupations, their character, or their intelligence, the fact that they have been transformed into a group puts them in possession of a sort of collective mind which makes them feel, think, and act in a manner quite different from that in which each individual of them would feel, think, and act were he in a state of isolation. There are certain ideas and feelings

which do not come into being, or do not transform themselves into acts except in the case of individuals forming a group. The psychological group is a provisional being formed of heterogeneous elements, which for a moment are combined, exactly as the cells which constitute a living body form by their reunion a new being which displays characteristics very different from those possessed by each of the cells singly.' (.)

We shall take the liberty of interrupting Le Bon's exposition with glosses of our own, and shall accordingly insert an observation at this point. If the individuals in the group are combined into a unity, there must surely be something to unite them, and this bond might be precisely the thing that is characteristic of a group. But Le Bon does not answer this question; he goes on to consider the alteration which the individual undergoes when in a group and describes it in terms which harmonize well with the fundamental postulates of our own depth-psychology.

'It is easy to prove how much the individual forming part of a group differs from the isolated individual, but it is less easy to discover the causes of this difference.

'To obtain at any rate a glimpse of them it is necessary in the first place to call to mind the truth established by modern psychology, that unconscious phenomena play an altogether preponderating part not only in organic life, but also in the operations of the intelligence. The conscious life of the mind is of small importance in comparison with its unconscious life. The most subtle analyst, the most acute observer, is scarcely successful in discovering more than a very small number of the conscious motives that determine his conduct. Our conscious acts are the outcome of an unconscious substratum created in the mind in the main by hereditary influences. This substratum consists of the innumerable common characteristics handed down from generation to generation, which constitute the genius of a race. Behind the avowed causes of our acts there undoubtedly lie secret causes that we do not avow, but behind these secret causes there are many others more secret still, of which we ourselves are ignorant. The greater part of our daily actions are the result of hidden motives which escape our observation.' (.)

Le Bon thinks that the particular acquirements of individuals become obliterated in a group, and that in this way their distinctiveness vanishes. The racial unconscious emerges; what is heterogeneous is submerged in what is homogeneous. We may say that the mental superstructure, the

development of which in individuals shows such dissimilarities, is removed, and that the unconscious foundations, which are similar in everyone, stand exposed to view.

In this way individuals in a group would come to show an average character. But Le Bon believes that they also display new characteristics which they have not previously possessed, and he seeks the reason for this in three different factors.

‘The first is that the individual forming part of a group acquires, solely from numerical considerations, a sentiment of invincible power which allows him to yield to instincts which, had he been alone, he would perforce have kept under restraint. He will be the less disposed to check himself from the consideration that, a group being anonymous, and in consequence irresponsible, the sentiment of responsibility which always controls individuals disappears entirely.’ (.)

From our point of view we need not attribute so much importance to the appearance of new characteristics. For us it would be enough to say that in a group the individual is brought under conditions which allow him to throw off the repressions of his unconscious instincts. The apparently new characteristics which he then displays are in fact the manifestations of this unconscious, in which all that is evil in the human mind is contained as a predisposition. We can find no difficulty in understanding the disappearance of conscience or of a sense of responsibility in these circumstances. It has long been our contention that ‘dread of society [*soziale Angst*]’ is the essence of what is called conscience.

‘The second cause, which is contagion, also intervenes to determine the manifestation in groups of their special characteristics, and at the same time the trend they are to take. Contagion is a phenomenon of which it is easy to establish the presence, but that it is not easy to explain. It must be classed among those phenomena of a hypnotic order, which we shall shortly study. In a group every sentiment and act is contagious, and contagious to such a degree that an individual readily sacrifices his personal interest to the collective interest. This is an aptitude very contrary to his nature, and of which a man is scarcely capable, except when he makes part of a group.’ (.)

We shall later on base an important conjecture upon this last statement.

‘A third cause, and by far the most important, determines in the individuals of a group special characteristics which are quite contrary at

times to those presented by the isolated individual. I allude to that suggestibility of which, moreover, the contagion mentioned above is only an effect.

‘To understand this phenomenon it is necessary to bear in mind certain recent physiological discoveries. We know to-day that by various processes an individual may be brought into such a condition that, having entirely lost his conscious personality, he obeys all the suggestions of the operator who has deprived him of it, and commits acts in utter contradiction with his character and habits. The most careful investigations seem to prove that an individual immersed for some length of time in a group in action soon finds himself — either in consequence of the magnetic influence given out by the group, or from some other cause of which we are ignorant — in a special state, which much resembles the state of fascination in which the hypnotised individual finds himself in the hands of the hypnotiser.... The conscious personality has entirely vanished; will and discernment are lost. All feelings and thoughts are bent in the direction determined by the hypnotiser.

‘Such also is approximately the state of the individual forming part of a psychological group. He is no longer conscious of his acts. In his case, as in the case of the hypnotised subject, at the same time that certain faculties are destroyed, others may be brought to a high degree of exaltation. Under the influence of a suggestion, he will undertake the accomplishment of certain acts with irresistible impetuosity. This impetuosity is the more irresistible in the case of groups than in that of the hypnotised subject, from the fact that, the suggestion being the same for all the individuals of the group, it gains in strength by reciprocity.’ (.)

‘We see, then, that the disappearance of the conscious personality, the predominance of the unconscious personality, the turning by means of suggestion and contagion of feelings and ideas in an identical direction, the tendency to immediately transform the suggested ideas into acts; these, we see, are the principal characteristics of the individual forming part of a group. He is no longer himself, but has become an automaton who has ceased to be guided by his will.’ (.)

I have quoted this passage so fully in order to make it quite clear that Le Bon explains the condition of an individual in a group as being actually hypnotic, and does not merely make a comparison between the two states. We have no intention of raising any objection at this point, but wish only

to emphasize the fact that the two last causes of an individual becoming altered in a group (the contagion and the heightened suggestibility) are evidently not on a par, since the contagion seems actually to be a manifestation of the suggestibility. Moreover the effects of the two factors do not seem to be sharply differentiated in the text of Le Bon's remarks. We may perhaps best interpret his statement if we connect the contagion with the effects of the individual members of the group upon one another, while we point to another source for those manifestations of suggestion in the group which are put on a level with the phenomena of hypnotic influence. But to what source? We cannot avoid being struck with a sense of deficiency when we notice that one of the chief elements of the comparison, namely the person who is to replace the hypnotist in the case of the group, is not mentioned in Le Bon's exposition. But he nevertheless distinguishes between this influence of fascination which remains plunged in obscurity and the contagious effect which the individuals exercise upon one another and by which the original suggestion is strengthened.

Here is yet another important consideration for helping us to understand the individual in a group: 'Moreover, by the mere fact that he forms part of an organised group, a man descends several rungs in the ladder of civilisation. Isolated, he may be a cultivated individual; in a crowd, he is a barbarian — that is, a creature acting by instinct. He possesses the spontaneity, the violence, the ferocity, and also the enthusiasm and heroism of primitive beings.' (.) He then dwells especially upon the lowering in intellectual ability which an individual experiences when he becomes merged in a group.

Let us now leave the individual, and turn to the group mind, as it has been outlined by Le Bon. It shows not a single feature which a psycho-analyst would find any difficulty in placing or in deriving from its source. Le Bon himself shows us the way by pointing to its similarity with the mental life of primitive people and of children ().

A group is impulsive, changeable and irritable. It is led almost exclusively by the unconscious. The impulses which a group obeys may according to circumstances be generous or cruel, heroic or cowardly, but they are always so imperious that no personal interest, not even that of self-preservation, can make itself felt (). Nothing about it is premeditated. Though it may desire things passionately, yet this is never so for long, for it is incapable of perseverance. It cannot tolerate any delay between its

desire and the fulfilment of what it desires. It has a sense of omnipotence; the notion of impossibility disappears for the individual in a group.

A group is extraordinarily credulous and open to influence, it has no critical faculty, and the improbable does not exist for it. It thinks in images, which call one another up by association (just as they arise with individuals in states of free imagination), and whose agreement with reality is never checked by any reasonable function [*Instanz*]. The feelings of a group are always very simple and very exaggerated. So that a group knows neither doubt nor uncertainty.

It goes directly to extremes; if a suspicion is expressed, it is instantly changed into an incontrovertible certainty; a trace of antipathy is turned into furious hatred ().

Inclined as it itself is to all extremes, a group can only be excited by an excessive stimulus. Anyone who wishes to produce an effect upon it needs no logical adjustment in his arguments; he must paint in the most forcible colours, he must exaggerate, and he must repeat the same thing again and again.

Since a group is in no doubt as to what constitutes truth or error, and is conscious, moreover, of its own great strength, it is as intolerant as it is obedient to authority. It respects force and can only be slightly influenced by kindness, which it regards merely as a form of weakness. What it demands of its heroes is strength, or even violence. It wants to be ruled and oppressed and to fear its masters. Fundamentally it is entirely conservative, and it has a deep aversion from all innovations and advances and an unbounded respect for tradition ().

In order to make a correct judgement upon the morals of groups, one must take into consideration the fact that when individuals come together in a group all their individual inhibitions fall away and all the cruel, brutal and destructive instincts, which lie dormant in individuals as relics of a primitive epoch, are stirred up to find free gratification. But under the influence of suggestion groups are also capable of high achievements in the shape of abnegation, unselfishness, and devotion to an ideal. While with isolated individuals personal interest is almost the only motive force, with groups it is very rarely prominent. It is possible to speak of an individual having his moral standards raised by a group (). Whereas the intellectual capacity of a group is always far below that of an individual, its ethical conduct may rise as high above his as it may sink deep below it.

Some other features in Le Bon's description show in a clear light how well justified is the identification of the group mind with the mind of primitive people. In groups the most contradictory ideas can exist side by side and tolerate each other, without any conflict arising from the logical contradiction between them. But this is also the case in the unconscious mental life of individuals, of children and of neurotics, as psycho-analysis has long pointed out.

A group, further, is subject to the truly magical power of words; they can evoke the most formidable tempests in the group mind, and are also capable of stilling them (). 'Reason and arguments are incapable of combating certain words and formulas. They are uttered with solemnity in the presence of groups, and as soon as they have been pronounced an expression of respect is visible on every countenance, and all heads are bowed. By many they are considered as natural forces, as supernatural powers.' (.) It is only necessary in this connection to remember the taboo upon names among primitive people and the magical powers which they ascribe to names and words.

And, finally, groups have never thirsted after truth. They demand illusions, and cannot do without them. They constantly give what is unreal precedence over what is real; they are almost as strongly influenced by what is untrue as by what is true. They have an evident tendency not to distinguish between the two ().

We have pointed out that this predominance of the life of phantasy and of the illusion born of an unfulfilled wish is the ruling factor in the psychology of neuroses. We have found that what neurotics are guided by is not ordinary objective reality but psychological reality. A hysterical symptom is based upon phantasy instead of upon the repetition of real experience, and the sense of guilt in an obsessional neurosis is based upon the fact of an evil intention which was never carried out. Indeed, just as in dreams and in hypnosis, in the mental operations of a group the function for testing the reality of things falls into the background in comparison with the strength of wishes with their affective cathexis.

What Le Bon says on the subject of leaders of groups is less exhaustive, and does not enable us to make out an underlying principle so clearly. He thinks that as soon as living beings are gathered together in certain numbers, no matter whether they are a herd of animals or a collection of human beings, they place themselves instinctively under the authority of a

chief (). A group is an obedient herd, which could never live without a master. It has such a thirst for obedience that it submits instinctively to anyone who appoints himself its master.

Although in this way the needs of a group carry it half-way to meet the leader, yet he too must fit in with it in his personal qualities. He must himself be held in fascination by a strong faith (in an idea) in order to awaken the group's faith; he must possess a strong and imposing will, which the group, which has no will of its own, can accept from him. Le Bon then discusses the different kinds of leaders, and the means by which they work upon the group. On the whole he believes that the leaders make themselves felt by means of the ideas in which they themselves are fanatical believers.

Moreover, he ascribes both to the ideas and to the leaders a mysterious and irresistible power, which he calls 'prestige'. Prestige is a sort of domination exercised over us by an individual, a work or an idea. It entirely paralyses our critical faculty, and fills us with astonishment and respect. It would seem to arouse a feeling like that of fascination in hypnosis (). He distinguishes between acquired or artificial and personal prestige. The former is attached to persons in virtue of their name, fortune and reputation, and to opinions, works of art, etc., in virtue of tradition. Since in every case it harks back to the past, it cannot be of much help to us in understanding this puzzling influence. Personal prestige is attached to a few people, who become leaders by means of it, and it has the effect of making everything obey them as though by the operation of some magnetic magic. All prestige, however, is also dependent upon success, and is lost in the event of failure ().

We cannot feel that Le Bon has brought the function of the leader and the importance of prestige completely into harmony with his brilliantly executed picture of the group mind.

III. OTHER ACCOUNTS OF COLLECTIVE MENTAL LIFE

We have made use of Le Bon's description by way of introduction, because it fits in so well with our own Psychology in the emphasis which it lays upon unconscious mental life. But we must now add that as a matter of fact none of that author's statements bring forward anything new. Everything that he says to the detriment and depreciation of the manifestations of the group mind had already been said by others before him with equal distinctness and equal hostility, and has been repeated in unison by thinkers, statesmen and writers since the earliest periods of literature. The two theses which comprise the most important of Le Bon's opinions, those touching upon the collective inhibition of intellectual functioning and the heightening of affectivity in groups, had been formulated shortly before by Sighele. At bottom, all that is left over as being peculiar to Le Bon are the two notions of the unconscious and of the comparison with the mental life of primitive people, and even these had naturally often been alluded to before him.

But, what is more, the description and estimate of the group mind as they have been given by Le Bon and the rest have not by any means been left undisputed. There is no doubt that all the phenomena of the group mind which have just been mentioned have been correctly observed, but it is also possible to distinguish other manifestations of the group formation, which operate in a precisely opposite sense, and from which a much higher opinion of the group mind must necessarily follow.

Le Bon himself was prepared to admit that in certain circumstances the morals of a group can be higher than those of the individuals that compose it, and that only collectivities are capable of a high degree of unselfishness and devotion. 'While with isolated individuals personal interest is almost the only motive force, with groups it is very rarely prominent.' (.) Other writers adduce the fact that it is only society which prescribes any ethical standards at all for the individual, while he as a rule fails in one way or another to come up to its high demands. Or they point out that in exceptional circumstances there may arise in communities the phenomenon of enthusiasm, which has made the most splendid group achievements possible.

As regards intellectual work it remains a fact, indeed, that great decisions in the realm of thought and momentous discoveries and solutions of problems are only possible to an individual, working in solitude. But even the group mind is capable of genius in intellectual creation, as is shown above all by language itself, as well as by folk-song, folk-lore and the like. It remains an open question, moreover, how much the individual thinker or writer owes to the stimulation of the group in which he lives, or whether he does more than perfect a mental work in which the others have had a simultaneous share.

In face of these completely contradictory accounts, it looks as though the work of Group Psychology were bound to come to an ineffectual end. But it is easy to find a more hopeful escape from the dilemma. A number of very different formations have probably been merged under the term ‘group’ and may require to be distinguished. The assertions of Sighele, Le Bon and the rest relate to groups of a short-lived character, which some passing interest has hastily agglomerated out of various sorts of individuals. The characteristics of revolutionary groups, and especially those of the great French Revolution, have unmistakably influenced their descriptions. The opposite opinions owe their origin to the consideration of those stable groups or associations in which mankind pass their lives, and which are embodied in the institutions of society. Groups of the first kind stand in the same sort of relation to those of the second as a high but choppy sea to a ground swell.

McDougall, in his book on *The Group Mind*, starts out from the same contradiction that has just been mentioned, and finds a solution for it in the factor of organisation. In the simplest case, he says, the ‘group’ possesses no organisation at all or one scarcely deserving the name. He describes a group of this kind as a ‘crowd’. But he admits that a crowd of human beings can hardly come together without possessing at all events the rudiments of an organisation, and that precisely in these simple groups many of the fundamental facts of Collective Psychology can be observed with special ease (). Before the members of a random crowd of people can constitute something in the nature of a group in the psychological sense of the word, a condition has to be fulfilled; these individuals must have something in common with one another, a common interest in an object, a similar emotional bias in some situation or other, and (‘consequently’, I should like to interpolate) ‘some degree of reciprocal influence’ (). The

higher the degree of ‘this mental homogeneity’, the more readily do the individuals form a psychological group, and the more striking are the manifestations of a group mind.

The most remarkable and also the most important result of the formation of a group is the ‘exaltation or intensification of emotion’ produced in every member of it (). In McDougall’s opinion men’s emotions are stirred in a group to a pitch that they seldom or never attain under other conditions; and it is a pleasurable experience for those who are concerned to surrender themselves so unreservedly to their passions and thus to become merged in the group and to lose the sense of the limits of their individuality. The manner in which individuals are thus carried away by a common impulse is explained by McDougall by means of what he calls the ‘principle of direct induction of emotion by way of the primitive sympathetic response’ (), that is, by means of the emotional contagion with which we are already familiar. The fact is that the perception of the signs of an emotional state is calculated automatically to arouse the same emotion in the person who perceives them. The greater the number of people in whom the same emotion can be simultaneously observed, the stronger does this automatic compulsion grow. The individual loses his power of criticism, and lets himself slip into the same emotion. But in so doing he increases the excitement of the other people, who had produced this effect upon him, and thus the emotional charge of the individuals becomes intensified by mutual interaction. Something is unmistakably at work in the nature of a compulsion to do the same as the others, to remain in harmony with the many. The coarser and simpler emotions are the more apt to spread through a group in this way ().

This mechanism for the intensification of emotion is favoured by some other influences which emanate from groups. A group impresses the individual with a sense of unlimited power and of insurmountable peril. For the moment it replaces the whole of human society, which is the wielder of authority, whose punishments the individual fears, and for whose sake he has submitted to so many inhibitions. It is clearly perilous for him to put himself in opposition to it, and it will be safer to follow the example of those around him and perhaps even ‘hunt with the pack’. In obedience to the new authority he may put his former ‘conscience’ out of action, and so surrender to the attraction of the increased pleasure that is certainly obtained from the removal of inhibitions. On the whole,

therefore, it is not so remarkable that we should see an individual in a group doing or approving things which he would have avoided in the normal conditions of life; and in this way we may even hope to clear up a little of the mystery which is so often covered by the enigmatic word ‘suggestion’.

McDougall does not dispute the thesis as to the collective inhibition of intelligence in groups (). He says that the minds of lower intelligence bring down those of a higher order to their own level. The latter are obstructed in their activity, because in general an intensification of emotion creates unfavourable conditions for sound intellectual work, and further because the individuals are intimidated by the group and their mental activity is not free, and because there is a lowering in each individual of his sense of responsibility for his own performances.

The judgement with which McDougall sums up the psychological behaviour of a simple ‘unorganised’ group is no more friendly than that of Le Bon. Such a group ’is excessively emotional, impulsive, violent, fickle, inconsistent, irresolute and extreme in action, displaying only the coarser emotions and the less refined sentiments; extremely suggestible, careless in deliberation, hasty in judgment, incapable of any but the simpler and imperfect forms of reasoning; easily swayed and led, lacking in self-consciousness, devoid of self-respect and of sense of responsibility, and apt to be carried away by the consciousness of its own force, so that it tends to produce all the manifestations we have learnt to expect of any irresponsible and absolute power. Hence its behaviour is like that of an unruly child or an untutored passionate savage in a strange situation, rather than like that of its average member; and in the worst cases it is like that of a wild beast, rather than like that of human beings.’ (.)

Since McDougall contrasts the behaviour of a highly organised group with what has just been described, we shall be particularly interested to learn in what this organisation consists, and by what factors it is produced. The author enumerates five ‘principal conditions’ for raising collective mental life to a higher level.

The first and fundamental condition is that there should be some degree of continuity of existence in the group. This may be either material or formal; the former, if the same individuals persist in the group for some time; and the latter, if there is developed within the group a system of fixed positions which are occupied by a succession of individuals.

The second condition is that in the individual member of the group some definite idea should be formed of the nature, composition, functions and capacities of the group, so that from this he may develop an emotional relation to the group as a whole.

The third is that the group should be brought into interaction (perhaps in the form of rivalry) with other groups similar to it but differing from it in many respects.

The fourth is that the group should possess traditions, customs and habits, and especially such as determine the relations of its members to one another.

The fifth is that the group should have a definite structure, expressed in the specialisation and differentiation of the functions of its constituents.

According to McDougall, if these conditions are fulfilled, the psychological disadvantages of the group formation are removed. The collective lowering of intellectual ability is avoided by withdrawing the performance of intellectual tasks from the group and reserving them for individual members of it.

It seems to us that the condition which McDougall designates as the ‘organisation’ of a group can with more justification be described in another way. The problem consists in how to procure for the group precisely those features which were characteristic of the individual and which are extinguished in him by the formation of the group. For the individual, outside the primitive group, possessed his own continuity, his self-consciousness, his traditions and customs, his own particular functions and position, and kept apart from his rivals. Owing to his entry into an ‘unorganised’ group he had lost this distinctiveness for a time. If we thus recognise that the aim is to equip the group with the attributes of the individual, we shall be reminded of a valuable remark of Trotter’s, to the effect that the tendency towards the formation of groups is biologically a continuation of the multicellular character of all the higher organisms.

IV. SUGGESTION AND LIBIDO

We started from the fundamental fact that an individual in a group is subjected through its influence to what is often a profound alteration in his mental activity. His emotions become extraordinarily intensified, while his intellectual ability becomes markedly reduced, both processes being evidently in the direction of an approximation to the other individuals in the group; and this result can only be reached by the removal of those inhibitions upon his instincts which are peculiar to each individual, and by his resigning those expressions of his inclinations which are especially his own. We have heard that these often unwelcome consequences are to some extent at least prevented by a higher ‘organisation’ of the group; but this does not contradict the fundamental fact of Group Psychology — the two theses as to the intensification of the emotions and the inhibition of the intellect in primitive groups. Our interest is now directed to discovering the psychological explanation of this mental change which is experienced by the individual in a group.

It is clear that rational factors (such as the intimidation of the individual which has already been mentioned, that is, the action of his instinct of self-preservation) do not cover the observable phenomena. Beyond this what we are offered as an explanation by authorities upon Sociology and Group Psychology is always the same, even though it is given various names, and that is — the magic word ‘suggestion’. Tarde calls it ‘imitation’; but we cannot help agreeing with a writer who protests that imitation comes under the concept of suggestion, and is in fact one of its results. Le Bon traces back all the puzzling features of social phenomena to two factors: the mutual suggestion of individuals and the prestige of leaders. But prestige, again, is only recognizable by its capacity for evoking suggestion. McDougall for a moment gives us an impression that his principle of ‘primitive induction of emotion’ might enable us to do without the assumption of suggestion. But on further consideration we are forced to perceive that this principle says no more than the familiar assertions about ‘imitation’ or ‘contagion’, except for a decided stress upon the emotional factor. There is no doubt that something exists in us which, when we become aware of signs of an emotion in someone else, tends to make us fall into the same emotion; but how often do we not

successfully oppose it, resist the emotion, and react in quite an opposite way? Why, therefore, do we invariably give way to this contagion when we are in a group? Once more we should have to say that what compels us to obey this tendency is imitation, and what induces the emotion in us is the group's suggestive influence. Moreover, quite apart from this, McDougall does not enable us to evade suggestion; we hear from him as well as from other writers that groups are distinguished by their special suggestibility.

We shall therefore be prepared for the statement that suggestion (or more correctly suggestibility) is actually an irreducible, primitive phenomenon, a fundamental fact in the mental life of man. Such, too, was the opinion of Bernheim, of whose astonishing arts I was a witness in the year 1889. But I can remember even then feeling a muffled hostility to this tyranny of suggestion. When a patient who showed himself unamenable was met with the shout: 'What are you doing? *Vous vous contresuggestionnez!'*, I said to myself that this was an evident injustice and an act of violence. For the man certainly had a right to counter-suggestions if they were trying to subdue him with suggestions. Later on my resistance took the direction of protesting against the view that suggestion, which explained everything, was itself to be preserved from explanation. Thinking of it, I repeated the old conundrum:

Christoph trug Christum,
Christus trug die ganze Welt,
Sag' wo hat Christoph
Damals hin den Fuss gestellt?

Christophorus Christum, sed Christus sustulit orbem:
Constiterit pedibus dic ubi Christophorus?

Now that I once more approach the riddle of suggestion after having kept away from it for some thirty years, I find there is no change in the situation. To this statement I can discover only a single exception, which I need not mention, since it is one which bears witness to the influence of psycho-analysis. I notice that particular efforts are being made to formulate the concept of suggestion correctly, that is, to fix the conventional use of the name. And this is by no means superfluous, for the word is acquiring a more and more extended use and a looser and looser

meaning, and will soon come to designate any sort of influence whatever, just as in English, where ‘to suggest’ and ‘suggestion’ correspond to our *nahelegen* and *Anregung*. But there has been no explanation of the nature of suggestion, that is, of the conditions under which influence without adequate logical foundation takes place. I should not avoid the task of supporting this statement by an analysis of the literature of the last thirty years, if I were not aware that an exhaustive inquiry is being undertaken close at hand which has in view the fulfilment of this very task.

Instead of this I shall make an attempt at using the concept of *libido* for the purpose of throwing light upon Group Psychology, a concept which has done us such good service in the study of psycho-neuroses.

Libido is an expression taken from the theory of the emotions. We call by that name the energy (regarded as a quantitative magnitude, though not at present actually mensurable) of those instincts which have to do with all that may be comprised under the word ‘love’. The nucleus of what we mean by love naturally consists (and this is what is commonly called love, and what the poets sing of) in sexual love with sexual union as its aim. But we do not separate from this — what in any case has a share in the name ‘love’ — on the one hand, self-love, and on the other, love for parents and children, friendship and love for humanity in general, and also devotion to concrete objects and to abstract ideas. Our justification lies in the fact that psycho-analytic research has taught us that all these tendencies are an expression of the same instinctive activities; in relations between the sexes these instincts force their way towards sexual union, but in other circumstances they are diverted from this aim or are prevented from reaching it, though always preserving enough of their original nature to keep their identity recognizable (as in such features as the longing for proximity, and self-sacrifice).

We are of opinion, then, that language has carried out an entirely justifiable piece of unification in creating the word ‘love’ with its numerous uses, and that we cannot do better than take it as the basis of our scientific discussions and expositions as well. By coming to this decision, psycho-analysis has let loose a storm of indignation, as though it had been guilty of an act of outrageous innovation. Yet psycho-analysis has done nothing original in taking love in this ‘wider’ sense. In its origin, function, and relation to sexual love, the ‘*Eros*’ of the philosopher Plato coincides exactly with the love force, the libido, of psycho-analysis, as has been

shown in detail by Nachmansohn and Pfister; and when the apostle Paul, in his famous epistle to the Corinthians, prizes love above all else, he certainly understands it in the same ‘wider’ sense. But this only shows that men do not always take their great thinkers seriously, even when they profess most to admire them.

Psycho-analysis, then, gives these love instincts the name of sexual instincts, a *potiori* and by reason of their origin. The majority of ‘educated’ people have taken their revenge by retorting upon psycho-analysis with the reproach of ‘pan-sexualism’. Anyone who considers sex as something mortifying and humiliating to human nature is at liberty to make use of the more genteel expressions ‘Eros’ and ‘erotic’. I might have done so myself from the first and thus have spared myself much opposition. But I did not want to, for I like to avoid concessions to faint-heartedness. One can never tell where that road may lead one; one gives way first in words, and then little by little in substance too. I cannot see any merit in being ashamed of sex; the Greek word ‘Eros’, which is to soften the affront, is in the end nothing more than a translation of our German word *Liebe* [love]; and finally, he who knows how to wait need make no concessions.

We will try our fortune, then, with the supposition that love relationships (or, to use a more neutral expression, emotional ties) also constitute the essence of the group mind. Let us remember that the authorities make no mention of any such relations. What would correspond to them is evidently concealed behind the shelter, the screen, of suggestion. Our hypothesis finds support in the first instance from two passing thoughts. First, that a group is clearly held together by a power of some kind: and to what power could this feat be better ascribed than to Eros, who holds together everything in the world? Secondly, that if an individual gives up his distinctiveness in a group and lets its other members influence him by suggestion, it gives one the impression that he does it because he feels the need of being in harmony with them rather than in opposition to them — so that perhaps after all he does it ‘*ihnen zu Liebe*’.

V. TWO ARTIFICIAL GROUPS: THE CHURCH AND THE ARMY

We may recall from what we know of the morphology of groups that it is possible to distinguish very different kinds of groups and opposing lines in their development. There are very fleeting groups and extremely lasting ones; homogeneous ones, made up of the same sorts of individuals, and unhomogeneous ones; natural groups, and artificial ones, requiring an external force to keep them together; primitive groups, and highly organised ones with a definite structure. But for reasons which have yet to be explained we should like to lay particular stress upon a distinction to which the authorities have rather given too little attention; I refer to that between leaderless groups and those with leaders. And, in complete opposition to the usual practice, we shall not choose a relatively simple group formation as our point of departure, but shall begin with highly organised, lasting and artificial groups. The most interesting example of such structures are churches — communities of believers — and armies.

A church and an army are artificial groups, that is, a certain external force is employed to prevent them from disintegrating and to check alterations in their structure. As a rule a person is not consulted or is given no choice, as to whether he wants to enter such a group; any attempt at leaving it is usually met with persecution or with severe punishment, or has quite definite conditions attached to it. It is quite outside our present interest to enquire why these associations need such special safeguards. We are only attracted by one circumstance, namely that certain facts, which are far more concealed in other cases, can be observed very clearly in those highly organised groups which are protected from dissolution in the manner that has been mentioned. In a church (and we may with advantage take the Catholic Church as a type) as well as in an army, however different the two may be in other respects, the same illusion holds good of there being a head — in the Catholic Church Christ, in an army its Commander-in-Chief — who loves all the individuals in the group with an equal love. Everything depends upon this illusion; if it were to be dropped, then both Church and army would dissolve, so far as the external force permitted them to. This equal love was expressly enunciated by Christ: ‘Inasmuch as ye have done it unto one of the least of these my brethren, ye

have done it unto me.' He stands to the individual members of the group of believers in the relation of a kind elder brother; he is their father surrogate. All the demands that are made upon the individual are derived from this love of Christ's. A democratic character runs through the Church, for the very reason that before Christ everyone is equal, and that everyone has an equal share in his love. It is not without a deep reason that the similarity between the Christian community and a family is invoked, and that believers call themselves brothers in Christ, that is, brothers through the love which Christ has for them. There is no doubt that the tie which unites each individual with Christ is also the cause of the tie which unites them with one another. The like holds good of an army. The Commander-in-Chief is a father who loves all his soldiers equally, and for that reason they are comrades among themselves. The army differs structurally from the Church in being built up of a series of such groups. Every captain is, as it were, the Commander-in-Chief and the father of his company, and so is every non-commissioned officer of his section. It is true that a similar hierarchy has been constructed in the Church, but it does not play the same part in it economically; for more knowledge and care about individuals may be attributed to Christ than to a human Commander-in-Chief.

It is to be noticed that in these two artificial groups each individual is bound by libidinal ties on the one hand to the leader (Christ, the Commander-in-Chief) and on the other hand to the other members of the group. How these two ties are related to each other, whether they are of the same kind and the same value, and how they are to be described psychologically — these questions must be reserved for subsequent enquiry. But we shall venture even now upon a mild reproach against the authorities for not having sufficiently appreciated the importance of the leader in the psychology of the group, while our own choice of a first object for investigation has brought us into a more favourable position. It would appear as though we were on the right road towards an explanation of the principal phenomenon of Group Psychology — the individual's lack of freedom in a group. If each individual is bound in two directions by such an intense emotional tie, we shall find no difficulty in attributing to that circumstance the alteration and limitation which have been observed in his personality.

A hint to the same effect, that the essence of a group lies in the libidinal ties existing in it, is also to be found in the phenomenon of panic, which is best studied in military groups. A panic arises if a group of that kind becomes disintegrated. Its characteristics are that none of the orders given by superiors are any longer listened to, and that each individual is only solicitous on his own account, and without any consideration for the rest. The mutual ties have ceased to exist, and a gigantic and senseless dread [*Angst*] is set free. At this point, again, the objection will naturally be made that it is rather the other way round; and that the dread has grown so great as to be able to disregard all ties and all feelings of consideration for others. McDougall has even () made use of the case of panic (though not of military panic) as a typical instance of that intensification of emotion by contagion ('primary induction') upon which he lays so much emphasis. But nevertheless this rational method of explanation is here quite inadequate. The very question that needs explanation is why the dread has become so gigantic. The greatness of the danger cannot be responsible, for the same army which now falls a victim to panic may previously have faced equally great or greater danger with complete success; it is of the very essence of panic that it bears no relation to the danger that threatens, and often breaks out upon the most trivial occasions. If an individual in panic dread begins to be solicitous only on his own account, he bears witness in so doing to the fact that the emotional ties, which have hitherto made the danger seem small to him, have ceased to exist. Now that he is by himself in facing the danger, he may surely think it greater. The fact is, therefore, that panic dread presupposes a relaxation in the libidinal structure of the group and reacts to it in a justifiable manner, and the contrary view — that the libidinal ties of the group are destroyed owing to dread in the face of the danger — can be refuted.

The contention that dread in a group is increased to enormous proportions by means of induction (contagion) is not in the least contradicted by these remarks. McDougall's view meets the case entirely when the danger is a really great one and when the group has no strong emotional ties — conditions which are fulfilled, for instance, when a fire breaks out in a theatre or a place of amusement. But the really instructive case and the one which can be best employed for our purposes is that mentioned above, in which a body of troops breaks into a panic although the danger has not increased beyond a degree that is usual and has often

been previously faced. It is not to be expected that the usage of the word ‘panic’ should be clearly and unambiguously determined. Sometimes it is used to describe any collective dread, sometimes even dread in an individual when it exceeds all bounds, and often the name seems to be reserved for cases in which the outbreak of dread is not warranted by the occasion. If we take the word ‘panic’ in the sense of collective dread, we can establish a far-reaching analogy. Dread in an individual is provoked either by the greatness of a danger or by the cessation of emotional ties (libidinal cathexes [*Libidobesetzungen*]); the latter is the case of neurotic dread. In just the same way panic arises either owing to an increase of the common danger or owing to the disappearance of the emotional ties which hold the group together; and the latter case is analogous to that of neurotic dread.

Anyone who, like McDougall (l.c.), describes a panic as one of the plainest functions of the ‘group mind’, arrives at the paradoxical position that this group mind does away with itself in one of its most striking manifestations. It is impossible to doubt that panic means the disintegration of a group; it involves the cessation of all the feelings of consideration which the members of the group otherwise show one another.

The typical occasion of the outbreak of a panic is very much as it is represented in Nestroy’s parody of Hebbel’s play about Judith and Holofernes. A soldier cries out: “The general has lost his head!” and thereupon all the Assyrians take to flight. The loss of the leader in some sense or other, the birth, of misgivings about him, brings on the outbreak of panic, though the danger remains the same; the mutual ties between the members of the group disappear, as a rule, at the same time as the tie with their leader. The group vanishes in dust, like a Bologna flask when its top is broken off.

The dissolution of a religious group is not so easy to observe. A short time ago there came into my hands an English novel of Catholic origin, recommended by the Bishop of London, with the title *When It Was Dark*. It gave a clever and, as it seems to me, a convincing picture of such a possibility and its consequences. The novel, which is supposed to relate to the present day, tells how a conspiracy of enemies of the figure of Christ and of the Christian faith succeed in arranging for a sepulchre to be discovered in Jerusalem. In this sepulchre is an inscription, in which

Joseph of Arimathaea confesses that for reasons of piety he secretly removed the body of Christ from its grave on the third day after its entombment and buried it in this spot. The resurrection of Christ and his divine nature are by this means disposed of, and the result of this archaeological discovery is a convulsion in European civilisation and an extraordinary increase in all crimes and acts of violence, which only ceases when the forgers' plot has been revealed.

The phenomenon which accompanies the dissolution that is here supposed to overtake a religious group is not dread, for which the occasion is wanting. Instead of it ruthless and hostile impulses towards other people make their appearance, which, owing to the equal love of Christ, they had previously been unable to do. But even during the kingdom of Christ those people who do not belong to the community of believers, who do not love him, and whom he does not love, stand outside this tie. Therefore a religion, even if it calls itself the religion of love, must be hard and unloving to those who do not belong to it. Fundamentally indeed every religion is in this same way a religion of love for all those whom it embraces; while cruelty and intolerance towards those who do not belong to it are natural to every religion. However difficult we may find it personally, we ought not to reproach believers too severely on this account; people who are unbelieving or indifferent are so much better off psychologically in this respect. If to-day that intolerance no longer shows itself so violent and cruel as in former centuries, we can scarcely conclude that there has been a softening in human manners. The cause is rather to be found in the undeniable weakening of religious feelings and the libidinal ties which depend upon them. If another group tie takes the place of the religious one — and the socialistic tie seems to be succeeding in doing so — , then there will be the same intolerance towards outsiders as in the age of the Wars of Religion; and if differences between scientific opinions could ever attain a similar significance for groups, the same result would again be repeated with this new motivation.

VI. FURTHER PROBLEMS AND LINES OF WORK

We have hitherto considered two artificial groups and have found that they are dominated by two emotional ties. One of these, the tie with the leader, seems (at all events for these cases) to be more of a ruling factor than the other, which holds between the members of the group.

Now much else remains to be examined and described in the morphology of groups. We should have to start from the ascertained fact that a mere collection of people is not a group, so long as these ties have not been established in it; but we should have to admit that in any collection of people the tendency to form a psychological group may very easily become prominent. We should have to give our attention to the different kinds of groups, more or less stable, that arise spontaneously, and to study the conditions of their origin and of their dissolution. We should above all be concerned with the distinction between groups which have a leader and leaderless groups. We should consider whether groups with leaders may not be the more primitive and complete, whether in the others an idea, an abstraction, may not be substituted for the leader (a state of things to which religious groups, with their invisible head, form a transition stage), and whether a common tendency, a wish in which a number of people can have a share, may not in the same way serve as a substitute. This abstraction, again, might be more or less completely embodied in the figure of what we might call a secondary leader, and interesting varieties would arise from the relation between the idea and the leader. The leader or the leading idea might also, so to speak, be negative; hatred against a particular person or institution might operate in just the same unifying way, and might call up the same kind of emotional ties as positive attachment. Then the question would also arise whether a leader is really indispensable to the essence of a group — and other questions besides.

But all these questions, which may, moreover, have been dealt with in part in the literature of Group Psychology, will not succeed in diverting our interest from the fundamental psychological problems that confront us in the structure of a group. And our attention will first be attracted by a consideration which promises to bring us in the most direct way to a proof that libidinal ties are what characterize a group.

Let us keep before our eyes the nature of the emotional relations which hold between men in general. According to Schopenhauer's famous simile of the freezing porcupines no one can tolerate a too intimate approach to his neighbour.

The evidence of psycho-analysis shows that almost every intimate emotional relation between two people which lasts for some time — marriage, friendship, the relations between parents and children — leaves a sediment of feelings of aversion and hostility, which have first to be eliminated by repression. This is less disguised in the common wrangles between business partners or in the grumbles of a subordinate at his superior. The same thing happens when men come together in larger units. Every time two families become connected by a marriage, each of them thinks itself superior to or of better birth than the other. Of two neighbouring towns each is the other's most jealous rival; every little canton looks down upon the others with contempt. Closely related races keep one another at arm's length; the South German cannot endure the North German, the Englishman casts every kind of aspersion upon the Scotchman, the Spaniard despises the Portuguese. We are no longer astonished that greater differences should lead to an almost insuperable repugnance, such as the Gallic people feel for the German, the Aryan for the Semite, and the white races for the coloured.

When this hostility is directed against people who are otherwise loved we describe it as ambivalence of feeling; and we explain the fact, in what is probably far too rational a manner, by means of the numerous occasions for conflicts of interest which arise precisely in such intimate relations. In the undisguised antipathies and aversions which people feel towards strangers with whom they have to do we may recognize the expression of self-love — of narcissism. This self-love works for the self-assertion of the individual, and behaves as though the occurrence of any divergence from his own particular lines of development involved a criticism of them and a demand for their alteration. We do not know why such sensitiveness should have been directed to just these details of differentiation; but it is unmistakable that in this whole connection men give evidence of a readiness for hatred, an aggressiveness, the source of which is unknown, and to which one is tempted to ascribe an elementary character.

But the whole of this intolerance vanishes, temporarily or permanently, as the result of the formation of a group, and in a group. So long as a group

formation persists or so far as it extends, individuals behave as though they were uniform, tolerate other people's peculiarities, put themselves on an equal level with them, and have no feeling of aversion towards them. Such a limitation of narcissism can, according to our theoretical views, only be produced by one factor, a libidinal tie with other people. Love for oneself knows only one barrier — love for others, love for objects. The question will at once be raised whether community of interest in itself, without any addition of libido, must not necessarily lead to the toleration of other people and to considerateness for them. This objection may be met by the reply that nevertheless no lasting limitation of narcissism is effected in this way, since this tolerance does not persist longer than the immediate advantage gained from the other people's collaboration. But the practical importance of the discussion is less than might be supposed, for experience has shown that in cases of collaboration libidinal ties are regularly formed between the fellow-workers which prolong and solidify the relation between them to a point beyond what is merely profitable. The same thing occurs in men's social relations as has become familiar to psycho-analytic research in the course of the development of the individual libido. The libido props itself upon the satisfaction of the great vital needs, and chooses as its first objects the people who have a share in that process. And in the development of mankind as a whole, just as in individuals, love alone acts as the civilizing factor in the sense that it brings a change from egoism to altruism. And this is true both of the sexual love for women, with all the obligations which it involves of sparing what women are fond of, and also of the desexualised, sublimated homosexual love for other men, which springs from work in common. If therefore in groups narcissistic self-love is subject to limitations which do not operate outside them, that is cogent evidence that the essence of a group formation consists in a new kind of libidinal ties among the members of the group.

But our interest now leads us on to the pressing question as to what may be the nature of these ties which exist in groups. In the psycho-analytic study of neuroses we have hitherto been occupied almost exclusively with ties that unite with their objects those love instincts which still pursue directly sexual aims. In groups there can evidently be no question of sexual aims of that kind. We are concerned here with love instincts which have been diverted from their original aims, though they do not operate

with less energy on that account. Now we have already observed within the range of the usual sexual object-cathexis [*Objektbesetzung*] phenomena which represent a diversion of the instinct from its sexual aim. We have described them as degrees of being in love, and have recognized that they involve a certain encroachment upon the ego. We shall now turn our attention more closely to these phenomena of being in love, in the firm expectation of finding in them conditions which can be transferred to the ties that exist in groups. But we should also like to know whether this kind of object-cathexis, as we know it in sexual life, represents the only manner of emotional tie with other people, or whether we must take other mechanisms of the sort into account. As a matter of fact we learn from psycho-analysis that there do exist other mechanisms for emotional ties, the so-called *identifications*, insufficiently-known processes and hard to describe, the investigation of which will for some time keep us away from the subject of Group Psychology.

VII. IDENTIFICATION

Identification is known to psycho-analysis as the earliest expression of an emotional tie with another person. It plays a part in the early history of the Oedipus complex. A little boy will exhibit a special interest in his father; he would like to grow like him and be like him, and take his place everywhere. We may say simply that he takes his father as his ideal. This behaviour has nothing to do with a passive or feminine attitude towards his father (and towards males in general); it is on the contrary typically masculine. It fits in very well with the Oedipus complex, for which it helps to prepare the way.

At the same time as this identification with his father, or a little later, the boy has begun to develop a true object-cathexis towards his mother according to the anaclitic type [*Anlehnungstypus*]. He then exhibits, therefore, two psychologically distinct ties: a straightforward sexual object-cathexis towards his mother and a typical identification towards his father. The two subsist side by side for a time without any mutual influence or interference. In consequence of the irresistible advance towards a unification of mental life they come together at last; and the normal Oedipus complex originates from their confluence. The little boy notices that his father stands in his way with his mother. His identification with his father then takes on a hostile colouring and becomes identical with the wish to replace his father in regard to his mother as well. Identification, in fact, is ambivalent from the very first; it can turn into an expression of tenderness as easily as into a wish for someone's removal. It behaves like a derivative of the first *oral* phase of the organisation of the libido, in which the object that we long for and prize is assimilated by eating and is in that way annihilated as such. The cannibal, as we know, has remained at this standpoint; he has a devouring affection for his enemies and only devours people of whom he is fond.

The subsequent history of this identification with the father may easily be lost sight of. It may happen that the Oedipus complex becomes inverted, and that the father is taken as the object of a feminine attitude, an object from which the directly sexual instincts look for satisfaction; in that event the identification with the father has become the precursor of an

object tie with the father. The same holds good, with the necessary substitutions, of the baby daughter as well.

It is easy to state in a formula the distinction between an identification with the father and the choice of the father as an object. In the first case one's father is what one would like to *be*, and in the second he is what one would like to *have*. The distinction, that is, depends upon whether the tie attaches to the subject or to the object of the ego. The former is therefore already possible before any sexual object-choice has been made. It is much more difficult to give a clear metapsychological representation of the distinction. We can only see that identification endeavours to mould a person's own ego after the fashion of the one that has been taken as a 'model'.

Let us disentangle identification as it occurs in the structure of a neurotic symptom from its rather complicated connections. Supposing that a little girl (and we will keep to her for the present) develops the same painful symptom as her mother — for instance, the same tormenting cough. Now this may come about in various ways. The identification may come from the Oedipus complex; in that case it signifies a hostile desire on the girl's part to take her mother's place, and the symptom expresses her object love towards her father, and brings about a realisation, under the influence of a sense of guilt, of her desire to take her mother's place: 'You wanted to be your mother, and now you *are* — anyhow as far as the pain goes'. This is the complete mechanism of the structure of a hysterical symptom. Or, on the other hand, the symptom may be the same as that of the person who is loved — (so, for instance, Dora in the 'Bruchstück einer Hysterieanalyse' imitated her father's cough); in that case we can only describe the state of things by saying that *identification has appeared instead of object-choice, and that object-choice has regressed to identification*. We have heard that identification is the earliest and original form of emotional tie; it often happens that under the conditions in which symptoms are constructed, that is, where there is repression and where the mechanisms of the unconscious are dominant, object-choice is turned back into identification — the ego, that is, assumes the characteristics of the object. It is noticeable that in these identifications the ego sometimes copies the person who is not loved and sometimes the one who is loved. It must also strike us that in both cases the identification is a partial and

extremely limited one and only borrows a single trait from the person who is its object.

There is a third particularly frequent and important case of symptom formation, in which the identification leaves any object relation to the person who is being copied entirely out of account. Supposing, for instance, that one of the girls in a boarding school has had a letter from someone with whom she is secretly in love which arouses her jealousy, and that she reacts to it with a fit of hysterics; then some of her friends who know about it will contract the fit, as we say, by means of mental infection. The mechanism is that of identification based upon the possibility or desire of putting oneself in the same situation. The other girls would like to have a secret love affair too, and under the influence of a sense of guilt they also accept the pain involved in it. It would be wrong to suppose that they take on the symptom out of sympathy. On the contrary, the sympathy only arises out of the identification, and this is proved by the fact that infection or imitation of this kind takes place in circumstances where even less pre-existing sympathy is to be assumed than usually exists between friends in a girls' school. One ego has perceived a significant analogy with another upon one point — in our example upon a similar readiness for emotion; an identification is thereupon constructed on this point, and, under the influence of the pathogenic situation, is displaced on to the symptom which the one ego has produced. The identification by means of the symptom has thus become the mark of a point of coincidence between the two egos which has to be kept repressed.

What we have learned from these three sources may be summarised as follows. First, identification is the original form of emotional tie with an object; secondly, in a regressive way it becomes a substitute for a libidinal object tie, as it were by means of the introjection of the object into the ego; and thirdly, it may arise with every new perception of a common quality shared with some other person who is not an object of the sexual instinct. The more important this common quality is, the more successful may this partial identification become, and it may thus represent the beginning of a new tie.

We already begin to divine that the mutual tie between members of a group is in the nature of an identification of this kind, based upon an important emotional common quality; and we may suspect that this

common quality lies in the nature of the tie with the leader. Another suspicion may tell us that we are far from having exhausted the problem of identification, and that we are faced by the process which psychology calls 'empathy [*Einfühlung*]' and which plays the largest part in our understanding of what is inherently foreign to our ego in other people. But we shall here limit ourselves to the immediate emotional effects of identification, and shall leave on one side its significance for our intellectual life.

Psycho-analytic research, which has already occasionally attacked the more difficult problems of the psychoses, has also been able to exhibit identification to us in some other cases which are not immediately comprehensible. I shall treat two of these cases in detail as material for our further consideration.

The genesis of male homosexuality in a large class of cases is as follows. A young man has been unusually long and intensely fixated upon his mother in the sense of the Oedipus complex. But at last, after the end of his puberty, the time comes for exchanging his mother for some other sexual object. Things take a sudden turn: the young man does not abandon his mother, but identifies himself with her; he transforms himself into her, and now looks about for objects which can replace his ego for him, and on which he can bestow such love and care as he has experienced from his mother. This is a frequent process, which can be confirmed as often as one likes, and which is naturally quite independent of any hypothesis that may be made as to the organic driving force and the motives of the sudden transformation. A striking thing about this identification is its ample scale; it remoulds the ego in one of its important features — in its sexual character — upon the model of what has hitherto been the object. In this process the object itself is renounced — whether entirely or in the sense of being preserved only in the unconscious is a question outside the present discussion. Identification with an object that is renounced or lost as a substitute for it, introjection of this object into the ego, is indeed no longer a novelty to us. A process of the kind may sometimes be directly observed in small children. A short time ago an observation of this sort was published in the *Internationale Zeitschrift für Psychoanalyse*. A child who was unhappy over the loss of a kitten declared straight out that now he himself was the kitten, and accordingly crawled about on all fours, would not eat at table, etc.

Another such instance of introjection of the object has been provided by the analysis of melancholia, an affection which counts among the most remarkable of its exciting causes the real or emotional loss of a loved object. A leading characteristic of these cases is a cruel self-depreciation of the ego combined with relentless self-criticism and bitter self-reproaches. Analyses have shown that this disparagement and these reproaches apply at bottom to the object and represent the ego's revenge upon it. The shadow of the object has fallen upon the ego, as I have said elsewhere. The introjection of the object is here unmistakably clear.

But these melancholias also show us something else, which may be of importance for our later discussions. They show us the ego divided, fallen into two pieces, one of which rages against the second. This second piece is the one which has been altered by introjection and which contains the lost object. But the piece which behaves so cruelly is not unknown to us either. It comprises the conscience, a critical faculty [*Instanz*] within the ego, which even in normal times takes up a critical attitude towards the ego, though never so relentlessly and so unjustifiably. On previous occasions we have been driven to the hypothesis that some such faculty develops in our ego which may cut itself off from the rest of the ego and come into conflict with it. We have called it the 'ego ideal', and by way of functions we have ascribed to it self-observation, the moral conscience, the censorship of dreams, and the chief influence in repression. We have said that it is the heir to the original narcissism in which the childish ego found its self-sufficiency; it gradually gathers up from the influences of the environment the demands which that environment makes upon the ego and which the ego cannot always rise to; so that a man, when he cannot be satisfied with his ego itself, may nevertheless be able to find satisfaction in the ego ideal which has been differentiated out of the ego. In delusions of observation, as we have further shown, the disintegration of this faculty has become patent, and has thus revealed its origin in the influence of superior powers, and above all of parents. But we have not forgotten to add that the amount of distance between this ego ideal and the real ego is very variable from one individual to another, and that with many people this differentiation within the ego does not go further than with children.

But before we can employ this material for understanding the libidinal organisation of groups, we must take into account some other examples of the mutual relations between the object and the ego.

VIII. BEING IN LOVE AND HYPNOSIS

Even in its caprices the usage of language remains true to some kind of reality. Thus it gives the name of ‘love’ to a great many kinds of emotional relationship which we too group together theoretically as love; but then again it feels a doubt whether this love is real, true, actual love, and so hints at a whole scale of possibilities within the range of the phenomena of love. We shall have no difficulty in making the same discovery empirically.

In one class of cases being in love is nothing more than object-cathexis on the part of the sexual instincts with a view to directly sexual satisfaction, a cathexis which expires, moreover, when this aim has been reached; this is what is called common, sensual love. But, as we know, the libidinal situation rarely remains so simple. It was possible to calculate with certainty upon the revival of the need which had just expired; and this must no doubt have been the first motive for directing a lasting cathexis upon the sexual object and for ‘loving’ it in the passionless intervals as well.

To this must be added another factor derived from the astonishing course of development which is pursued by the erotic life of man. In his first phase, which has usually come to an end by the time he is five years old, a child has found the first object for his love in one or other of his parents, and all of his sexual instincts with their demand for satisfaction have been united upon this object. The repression which then sets in compels him to renounce the greater number of these infantile sexual aims, and leaves behind a profound modification in his relation to his parents. The child still remains tied to his parents, but by instincts which must be described as being ‘inhibited in their aim [*zielgehemmte*]’. The emotions which he feels henceforward towards these objects of his love are characterized as ‘tender’. It is well known that the earlier ‘sensual’ tendencies remain more or less strongly preserved in the unconscious, so that in a certain sense the whole of the original current continues to exist.

At puberty, as we know, there set in new and very strong tendencies with directly sexual aims. In unfavourable cases they remain separate, in the form of a sensual current, from the ‘tender’ emotional trends which persist. We are then faced by a picture the two aspects of which certain

movements in literature take such delight in idealising. A man of this kind will show a sentimental enthusiasm for women whom he deeply respects but who do not excite him to sexual activities, and he will only be potent with other women whom he does not ‘love’ but thinks little of or even despises. More often, however, the adolescent succeeds in bringing about a certain degree of synthesis between the unsensual, heavenly love and the sensual, earthly love, and his relation to his sexual object is characterised by the interaction of uninhibited instincts and of instincts inhibited in their aim. The depth to which anyone is in love, as contrasted with his purely sensual desire, may be measured by the size of the share taken by the inhibited instincts of tenderness.

In connection with this question of being in love we have always been struck by the phenomenon of sexual over-estimation — the fact that the loved object enjoys a certain amount of freedom from criticism, and that all its characteristics are valued more highly than those of people who are not loved, or than its own were at a time when it itself was not loved. If the sensual tendencies are somewhat more effectively repressed or set aside, the illusion is produced that the object has come to be sensually loved on account of its spiritual merits, whereas on the contrary these merits may really only have been lent to it by its sensual charm.

The tendency which falsifies judgement in this respect is that of *idealisation*. But this makes it easier for us to find our way about. We see that the object is being treated in the same way as our own ego, so that when we are in love a considerable amount of narcissistic libido overflows on to the object. It is even obvious, in many forms of love choice, that the object serves as a substitute for some unattained ego ideal of our own. We love it on account of the perfections which we have striven to reach for our own ego, and which we should now like to procure in this roundabout way as a means of satisfying our narcissism.

If the sexual over-estimation and the being in love increase even further, then the interpretation of the picture becomes still more unmistakable. The tendencies whose trend is towards directly sexual satisfaction may now be pushed back entirely, as regularly happens, for instance, with the young man’s sentimental passion; the ego becomes more and more unassuming and modest, and the object more and more sublime and precious, until at last it gets possession of the entire self-love of the ego, whose self-sacrifice thus follows as a natural consequence. The

object has, so to speak, consumed the ego. Traits of humility, of the limitation of narcissism, and of self-injury occur in every case of being in love; in the extreme case they are only intensified, and as a result of the withdrawal of the sensual claims they remain in solitary supremacy.

This happens especially easily with love that is unhappy and cannot be satisfied; for in spite of everything each sexual satisfaction always involves a reduction in sexual over-estimation. Contemporaneously with this ‘devotion’ of the ego to the object, which is no longer to be distinguished from a sublimated devotion to an abstract idea, the functions allotted to the ego ideal entirely cease to operate. The criticism exercised by that faculty is silent; everything that the object does and asks for is right and blameless. Conscience has no application to anything that is done for the sake of the object; in the blindness of love remorselessness is carried to the pitch of crime. The whole situation can be completely summarised in a formula: *The object has taken the place of the ego ideal.*

It is now easy to define the distinction between identification and such extreme developments of being in love as may be described as fascination or infatuation. In the former case the ego has enriched itself with the properties of the object, it has ‘introjected’ the object into itself, as Ferenczi expresses it. In the second case it is impoverished, it has surrendered itself to the object, it has substituted the object for its most important constituent. Closer consideration soon makes it plain, however, that this kind of account creates an illusion of contradistinctions that have no real existence. Economically there is no question of impoverishment or enrichment; it is even possible to describe an extreme case of being in love as a state in which the ego has introjected the object into itself. Another distinction is perhaps better calculated to meet the essence of the matter. In the case of identification the object has been lost or given up; it is then set up again inside the ego, and the ego makes a partial alteration in itself after the model of the lost object. In the other case the object is retained, and there is a hyper-cathexis of it by the ego and at the ego’s expense. But here again a difficulty presents itself. Is it quite certain that identification presupposes that object-cathexis has been given up? Can there be no identification with the object retained? And before we embark upon a discussion of this delicate question, the perception may already be beginning to dawn on us that yet another alternative embraces the real

essence of the matter, namely, *whether the object is put in the place of the ego or of the ego ideal*.

From being in love to hypnosis is evidently only a short step. The respects in which the two agree are obvious. There is the same humble subjection, the same compliance, the same absence of criticism, towards the hypnotist just as towards the loved object. There is the same absorption of one's own initiative; no one can doubt that the hypnotist has stepped into the place of the ego ideal. It is only that everything is even clearer and more intense in hypnosis, so that it would be more to the point to explain being in love by means of hypnosis than the other way round. The hypnotist is the sole object, and no attention is paid to any but him. The fact that the ego experiences in a dream-like way whatever he may request or assert reminds us that we omitted to mention among the functions of the ego ideal the business of testing the reality of things. No wonder that the ego takes a perception for real if its reality is vouched for by the mental faculty which ordinarily discharges the duty of testing the reality of things. The complete absence of tendencies which are uninhibited in their sexual aims contributes further towards the extreme purity of the phenomena. The hypnotic relation is the devotion of someone in love to an unlimited degree but with sexual satisfaction excluded; whereas in the case of being in love this kind of satisfaction is only temporarily kept back, and remains in the background as a possible aim at some later time.

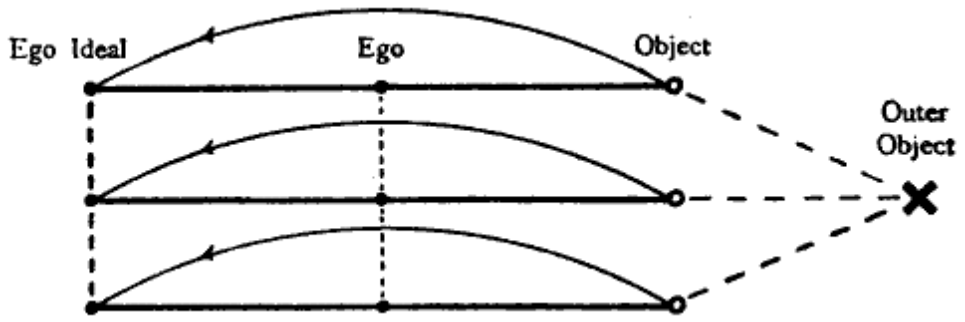
But on the other hand we may also say that the hypnotic relation is (if the expression is permissible) a group formation with two members. Hypnosis is not a good object for comparison with a group formation, because it is truer to say that it is identical with it. Out of the complicated fabric of the group it isolates one element for us — the behaviour of the individual to the leader. Hypnosis is distinguished from a group formation by this limitation of number, just as it is distinguished from being in love by the absence of directly sexual tendencies. In this respect it occupies a middle position between the two.

It is interesting to see that it is precisely those sexual tendencies that are inhibited in their aims which achieve such lasting ties between men. But this can easily be understood from the fact that they are not capable of complete satisfaction, while sexual tendencies which are uninhibited in their aims suffer an extraordinary reduction through the discharge of

energy every time the sexual aim is attained. It is the fate of sensual love to become extinguished when it is satisfied; for it to be able to last, it must from the first be mixed with purely tender components — with such, that is, as are inhibited in their aims — or it must itself undergo a transformation of this kind.

Hypnosis would solve the riddle of the libidinal constitution of groups for us straight away, if it were not that it itself exhibits some features which are not met by the rational explanation we have hitherto given of it as a state of being in love with the directly sexual tendencies excluded. There is still a great deal in it which we must recognise as unexplained and mystical. It contains an additional element of paralysis derived from the relation between someone with superior power and someone who is without power and helpless — which may afford a transition to the hypnosis of terror which occurs in animals. The manner in which it is produced and its relationship to sleep are not clear; and the puzzling way in which some people are subject to it, while others resist it completely, points to some factor still unknown which is realised in it and which perhaps alone makes possible the purity of the attitudes of the libido which it exhibits. It is noticeable that, even when there is complete suggestive compliance in other respects, the moral conscience of the person hypnotized may show resistance. But this may be due to the fact that in hypnosis as it is usually practised some knowledge may be retained that what is happening is only a game, an untrue reproduction of another situation of far more importance to life.

But after the preceding discussions we are quite in a position to give the formula for the libidinal constitution of groups: or at least of such groups as we have hitherto considered, namely, those that have a leader and have not been able by means of too much ‘organisation’ to acquire secondarily the characteristics of an individual. *A primary group of this kind is a number of individuals who have substituted one and the same object for their ego ideal and have consequently identified themselves with one another in their ego.* This condition admits of graphic representation:



Ego Ideal
Ego
Object
Outer
Object

IX. THE HERD INSTINCT

We cannot for long enjoy the illusion that we have solved the riddle of the group with this formula. It is impossible to escape the immediate and disturbing recollection that all we have really done has been to shift the question on to the riddle of hypnosis, about which so many points have yet to be cleared up. And now another objection shows us our further path.

It might be said that the intense emotional ties which we observe in groups are quite sufficient to explain one of their characteristics — the lack of independence and initiative in their members, the similarity in the reactions of all of them, their reduction, so to speak, to the level of group individuals. But if we look at it as a whole, a group shows us more than this. Some of its features — the weakness of intellectual ability, the lack of emotional restraint, the incapacity for moderation and delay, the inclination to exceed every limit in the expression of emotion and to work it off completely in the form of action — these and similar features, which we find so impressively described in Le Bon, show an unmistakable picture of a regression of mental activity to an earlier stage such as we are not surprised to find among savages or children. A regression of this sort is in particular an essential characteristic of common groups, while, as we have heard, in organized and artificial groups it can to a large extent be checked.

We thus have an impression of a state in which an individual's separate emotion and personal intellectual act are too weak to come to anything by themselves and are absolutely obliged to wait till they are reinforced through being repeated in a similar way in the other members of the group. We are reminded of how many of these phenomena of dependence are part of the normal constitution of human society, of how little originality and personal courage are to be found in it, of how much every individual is ruled by those attitudes of the group mind which exhibit themselves in such forms as racial characteristics, class prejudices, public opinion, etc. The influence of suggestion becomes a greater riddle for us when we admit that it is not exercised only by the leader, but by every individual upon every other individual; and we must reproach ourselves with having unfairly emphasized the relation to the leader and with having kept the other factor of mutual suggestion too much in the background.

After this encouragement to modesty, we shall be inclined to listen to another voice, which promises us an explanation based upon simpler grounds. Such a one is to be found in Trotter's thoughtful book upon the herd instinct, concerning which my only regret is that it does not entirely escape the antipathies that were set loose by the recent great war.

Trotter derives the mental phenomena that are described as occurring in groups from a herd instinct ('gregariousness'), which is innate in human beings just as in other species of animals. Biologically this gregariousness is an analogy to multicellularity and as it were a continuation of it. From the standpoint of the libido theory it is a further manifestation of the inclination, which proceeds from the libido, and which is felt by all living beings of the same kind, to combine in more and more comprehensive units. The individual feels 'incomplete' if he is alone. The dread shown by small children would seem already to be an expression of this herd instinct. Opposition to the herd is as good as separation from it, and is therefore anxiously avoided. But the herd turns away from anything that is new or unusual. The herd instinct would appear to be something primary, something 'which cannot be split up'.

Trotter gives as the list of instincts which he considers as primary those of self-preservation, of nutrition, of sex, and of the herd. The last often comes into opposition with the others. The feelings of guilt and of duty are the peculiar possessions of a gregarious animal. Trotter also derives from the herd instinct the repressive forces which psycho-analysis has shown to exist in the ego, and from the same source accordingly the resistances which the physician comes up against in psycho-analytic treatment. Speech owes its importance to its aptitude for mutual understanding in the herd, and upon it the identification of the individuals with one another largely rests.

While Le Bon is principally concerned with typical transient group formations, and McDougall with stable associations, Trotter has chosen as the centre of his interest the most generalised form of assemblage in which man, that ζῷον πολιτικόν, passes his life, and he gives us its psychological basis. But Trotter is under no necessity of tracing back the herd instinct, for he characterizes it as primary and not further reducible. Boris Sidis's attempt, to which he refers, at tracing the herd instinct back to suggestibility is fortunately superfluous as far as he is concerned; it is an explanation of a familiar and unsatisfactory type, and the converse

proposition — that suggestibility is a derivative of the herd instinct — would seem to me to throw far more light on the subject.

But Trotter's exposition, with even more justice than the others', is open to the objection that it takes too little account of the leader's part in a group, while we incline rather to the opposite judgement, that it is impossible to grasp the nature of a group if the leader is disregarded. The herd instinct leaves no room at all for the leader; he is merely thrown in along with the herd, almost by chance; it follows, too, that no path leads from this instinct to the need for a God; the herd is without a herdsman. But besides this Trotter's exposition can be undermined psychologically; that is to say, it can be made at all events probable that the herd instinct is not irreducible, that it is not primary in the same sense as the instinct of self-preservation and the sexual instinct.

It is naturally no easy matter to trace the ontogenesis of the herd instinct. The dread which is shown by small children when they are left alone, and which Trotter claims as being already a manifestation of the instinct, nevertheless suggests more readily another interpretation. The dread relates to the child's mother, and later to other familiar persons, and it is the expression of an unfulfilled desire, which the child does not yet know how to deal with in any way except by turning it into dread. Nor is the child's dread when it is alone pacified by the sight of any haphazard 'member of the herd', but on the contrary it is only brought into existence by the approach of a 'stranger' of this sort. Then for a long time nothing in the nature of herd instinct or group feeling is to be observed in children. Something like it grows up first of all, in a nursery containing many children, out of the children's relation to their parents, and it does so as a reaction to the initial envy with which the elder child receives the younger one. The elder child would certainly like to put its successor jealously aside, to keep it away from the parents, and to rob it of all its privileges; but in face of the fact that this child (like all that come later) is loved by the parents in just the same way, and in consequence of the impossibility of maintaining its hostile attitude without damaging itself, it is forced into identifying itself with the other children. So there grows up in the troop of children a communal or group feeling, which is then further developed at school. The first demand made by this reaction-formation is for justice, for equal treatment for all. We all know how loudly and implacably this claim is put forward at school. If one cannot be the favourite oneself, at all

events nobody else shall be the favourite. This transformation — the replacing of jealousy by a group feeling in the nursery and classroom — might be considered improbable, if the same process could not later on be observed again in other circumstances. We have only to think of the troop of women and girls, all of them in love in an enthusiastically sentimental way, who crowd round a singer or pianist after his performance. It would certainly be easy for each of them to be jealous of the rest; but, in face of their numbers and the consequent impossibility of their reaching the aim of their love, they renounce it, and, instead of pulling out one another's hair, they act as a united group, do homage to the hero of the occasion with their common actions, and would probably be glad to have a share of his flowing locks. Originally rivals, they have succeeded in identifying themselves with one another by means of a similar love for the same object. When, as is usual, a situation in the field of the instincts is capable of various outcomes, we need not be surprised if the actual outcome is one which involves the possibility of a certain amount of satisfaction, while another, even though in itself more obvious, is passed over because the circumstances of life prevent its attaining this aim.

What appears later on in society in the shape of *Gemeingeist*, *esprit de corps*, 'group spirit', etc., does not belie its derivation from what was originally envy. No one must want to put himself forward, every one must be the same and have the same. Social justice means that we deny ourselves many things so that others may have to do without them as well, or, what is the same thing, may not be able to ask for them. This demand for equality is the root of social conscience and the sense of duty. It reveals itself unexpectedly in the syphilitic's dread of infecting other people, which psycho-analysis has taught us to understand. The dread exhibited by these poor wretches corresponds to their violent struggles against the unconscious wish to spread their infection on to other people; for why should they alone be infected and cut off from so much? why not other people as well? And the same germ is to be found in the pretty anecdote of the judgement of Solomon. If one woman's child is dead, the other shall not have a live one either. The bereaved woman is recognized by this wish.

Thus social feeling is based upon the reversal of what was first a hostile feeling into a positively-toned tie of the nature of an identification. So far as we have hitherto been able to follow the course of events, this reversal

appears to be effected under the influence of a common tender tie with a person outside the group. We do not ourselves regard our analysis of identification as exhaustive, but it is enough for our present purpose that we should revert to this one feature — its demand that equalization shall be consistently carried through. We have already heard in the discussion of the two artificial groups, church and army, that their preliminary condition is that all their members should be loved in the same way by one person, the leader. Do not let us forget, however, that the demand for equality in a group applies only to its members and not to the leader. All the members must be equal to one another, but they all want to be ruled by one person. Many equals, who can identify themselves with one another, and a single person superior to them all — that is the situation that we find realised in groups which are capable of subsisting. Let us venture, then, to correct Trotter's pronouncement that man is a herd animal and assert that he is rather a horde animal, an individual creature in a horde led by a chief.

X. THE GROUP AND THE PRIMAL HORDE

In 1912 I took up a conjecture of Darwin's to the effect that the primitive form of human society was that of a horde ruled over despotically by a powerful male. I attempted to show that the fortunes of this horde have left indestructible traces upon the history of human descent; and, especially, that the development of totemism, which comprises in itself the beginnings of religion, morality, and social organisation, is connected with the killing of the chief by violence and the transformation of the paternal horde into a community of brothers. To be sure, this is only a hypothesis, like so many others with which archaeologists endeavour to lighten the darkness of prehistoric times — a 'Just-So Story', as it was amusingly called by a not unkind critic (Kroeger); but I think it is creditable to such a hypothesis if it proves able to bring coherence and understanding into more and more new regions.

Human groups exhibit once again the familiar picture of an individual of superior strength among a troop of similar companions, a picture which is also contained in our idea of the primal horde. The psychology of such a group, as we know it from the descriptions to which we have so often referred — the dwindling of the conscious individual personality, the focussing of thoughts and feelings into a common direction, the predominance of the emotions and of the unconscious mental life, the tendency to the immediate carrying out of intentions as they emerge — all this corresponds to a state of regression to a primitive mental activity, of just such a sort as we should be inclined to ascribe to the primal horde.

Thus the group appears to us as a revival of the primal horde. Just as primitive man virtually survives in every individual, so the primal horde may arise once more out of any random crowd; in so far as men are habitually under the sway of group formation we recognise in it the survival of the primal horde. We must conclude that the psychology of the group is the oldest human psychology; what we have isolated as individual psychology, by neglecting all traces of the group, has only since come into prominence out of the old group psychology, by a gradual process which may still, perhaps, be described as incomplete. We shall later venture upon an attempt at specifying the point of departure of this development.

Further reflection will show us in what respect this statement requires correction. Individual psychology must, on the contrary, be just as old as group psychology, for from the first there were two kinds of psychologies, that of the individual members of the group and that of the father, chief, or leader. The members of the group were subject to ties just as we see them to-day, but the father of the primal horde was free. His intellectual acts were strong and independent even in isolation, and his will needed no reinforcement from others. Consistency leads us to assume that his ego had few libidinal ties; he loved no one but himself, or other people only in so far as they served his needs. To objects his ego gave away no more than was barely necessary.

He, at the very beginning of the history of mankind, was the *Superman* whom Nietzsche only expected from the future. Even to-day the members of a group stand in need of the illusion that they are equally and justly loved by their leader; but the leader himself need love no one else, he may be of a masterly nature, absolutely narcissistic, but self-confident and independent. We know that love puts a check upon narcissism, and it would be possible to show how, by operating in this way, it became a factor of civilisation.

The primal father of the horde was not yet immortal, as he later became by deification. If he died, he had to be replaced; his place was probably taken by a youngest son, who had up to then been a member of the group like any other. There must therefore be a possibility of transforming group psychology into individual psychology; a condition must be discovered under which such a transformation is easily accomplished, just as it is possible for bees in case of necessity to turn a larva into a queen instead of into a worker. One can imagine only one possibility: the primal father had prevented his sons from satisfying their directly sexual tendencies; he forced them into abstinence and consequently into the emotional ties with him and with one another which could arise out of those of their tendencies that were inhibited in their sexual aim. He forced them, so to speak, into group psychology. His sexual jealousy and intolerance became in the last resort the causes of group psychology.

Whoever became his successor was also given the possibility of sexual satisfaction, and was by that means offered a way out of the conditions of group psychology. The fixation of the libido to woman and the possibility of satisfaction without any need for delay or accumulation made and end

of the importance of those of his sexual tendencies that were inhibited in their aim, and allowed his narcissism always to rise to its full height. We shall return in a postscript to this connection between love and character formation.

We may further emphasize, as being specially instructive, the relation that holds between the contrivance by means of which an artificial group is held together and the constitution of the primal horde. We have seen that with an army and a church this contrivance is the illusion that the leader loves all of the individuals equally and justly. But this is simply an idealistic remodelling of the state of affairs in the primal horde, where all of the sons knew that they were equally persecuted by the primal father, and feared him equally. This same recasting upon which all social duties are built up is already presupposed by the next form of human society, the totemistic clan. The indestructible strength of the family as a natural group formation rests upon the fact that this necessary presupposition of the father's equal love can have a real application in the family.

But we expect even more of this derivation of the group from the primal horde. It ought also to help us to understand what is still incomprehensible and mysterious in group formations — all that lies hidden behind the enigmatic words hypnosis and suggestion. And I think it can succeed in this too. Let us recall that hypnosis has something positively uncanny about it; but the characteristic of uncanniness suggests something old and familiar that has undergone repression. Let us consider how hypnosis is induced. The hypnotist asserts that he is in possession of a mysterious power which robs the subject of his own will, or, which is the same thing, the subject believes it of him. This mysterious power (which is even now often described popularly as animal magnetism) must be the same that is looked upon by primitive people as the source of taboo, the same that emanates from kings and chieftains and makes it dangerous to approach them (*mana*). The hypnotist, then, is supposed to be in possession of this power; and how does he manifest it? By telling the subject to look him in the eyes; his most typical method of hypnotising is by his look. But it is precisely the sight of the chieftain that is dangerous and unbearable for primitive people, just as later that of the Godhead is for mortals. Even Moses had to act as an intermediary between his people and Jehovah, since the people could not support the sight of God; and when he returned from the presence of God his face shone — some of the *mana* had

been transferred on to him, just as happens with the intermediary among primitive people.

It is true that hypnosis can also be evoked in other ways, for instance by fixing the eyes upon a bright object or by listening to a monotonous sound. This is misleading and has given occasion to inadequate physiological theories. As a matter of fact these procedures merely serve to divert conscious attention and to hold it riveted. The situation is the same as if the hypnotist had said to the subject: 'Now concern yourself exclusively with my person; the rest of the world is quite uninteresting.' It would of course be technically inexpedient for a hypnotist to make such a speech; it would tear the subject away from his unconscious attitude and stimulate him to conscious opposition. The hypnotist avoids directing the subject's conscious thoughts towards his own intentions, and makes the person upon whom he is experimenting sink into an activity in which the world is bound to seem uninteresting to him; but at the same time the subject is in reality unconsciously concentrating his whole attention upon the hypnotist, and is getting into an attitude of *rapport*, of transference on to him. Thus the indirect methods of hypnotising, like many of the technical procedures used in making jokes, have the effect of checking certain distributions of mental energy which would interfere with the course of events in the unconscious, and they lead eventually to the same result as the direct methods of influence by means of staring or stroking.

Ferenczi has made the true discovery that when a hypnotist gives the command to sleep, which is often done at the beginning of hypnosis, he is putting himself in the place of the subject's parents. He thinks that two sorts of hypnosis are to be distinguished: one coaxing and soothing, which he considers is modelled upon the mother, and another threatening, which is derived from the father. Now the command to sleep in hypnosis means nothing more nor less than an order to withdraw all interest from the world and to concentrate it upon the person of the hypnotist. And it is so understood by the subject; for in this withdrawal of interest from the outer world lies the psychological characteristic of sleep, and the kinship between sleep and the state of hypnosis is based upon it.

By the measures that he takes, then, the hypnotist awakens in the subject a portion of his archaic inheritance which had also made him compliant towards his parents and which had experienced an individual re-animation in his relation to his father; what is thus awakened is the idea of

a paramount and dangerous personality, towards whom only a passive-masochistic attitude is possible, to whom one's will has to be surrendered, — while to be alone with him, 'to look him in the face', appears a hazardous enterprise. It is only in some such way as this that we can picture the relation of the individual member of the primal horde to the primal father. As we know from other reactions, individuals have preserved a variable degree of personal aptitude for reviving old situations of this kind. Some knowledge that in spite of everything hypnosis is only a game, a deceptive renewal of these old impressions, may however remain behind and take care that there is a resistance against any too serious consequences of the suspension of the will in hypnosis.

The uncanny and coercive characteristics of group formations, which are shown in their suggestion phenomena, may therefore with justice be traced back to the fact of their origin from the primal horde. The leader of the group is still the dreaded primal father; the group still wishes to be governed by unrestricted force; it has an extreme passion for authority; in Le Bon's phrase, it has a thirst for obedience. The primal father is the group ideal, which governs the ego in the place of the ego ideal. Hypnosis has a good claim to being described as a group of two; there remains as a definition for suggestion — a conviction which is not based upon perception and reasoning but upon an erotic tie.

XI. A DIFFERENTIATING GRADE IN THE EGO

If we survey the life of an individual man of to-day, bearing in mind the mutually complementary accounts of group psychology given by the authorities, we may lose the courage, in face of the complications that are revealed, to attempt a comprehensive exposition. Each individual is a component part of numerous groups, he is bound by ties of identification in many directions, and he has built up his ego ideal upon the most various models. Each individual therefore has a share in numerous group minds — those of his race, of his class, of his creed, of his nationality, etc. — and he can also raise himself above them to the extent of having a scrap of independence and originality. Such stable and lasting group formations, with their uniform and constant effects, are less striking to an observer than the rapidly formed and transient groups from which Le Bon has made his brilliant psychological character sketch of the group mind. And it is just in these noisy ephemeral groups, which are as it were superimposed upon the others, that we are met by the prodigy of the complete, even though only temporary, disappearance of exactly what we have recognized as individual acquirements.

We have interpreted this prodigy as meaning that the individual gives up his ego ideal and substitutes for it the group ideal as embodied in the leader. And we must add by way of correction that the prodigy is not equally great in every case. In many individuals the separation between the ego and the ego ideal is not very far advanced; the two still coincide readily; the ego has often preserved its earlier self-complacency. The selection of the leader is very much facilitated by this circumstance. He need only possess the typical qualities of the individuals concerned in a particularly clearly marked and pure form, and need only give an impression of greater force and of more freedom of libido; and in that case the need for a strong chief will often meet him half-way and invest him with a predominance to which he would otherwise perhaps have had no claim. The other members of the group, whose ego ideal would not, apart from this, have become embodied in his person without some correction, are then carried away with the rest by ‘suggestion’, that is to say, by means of identification.

We are aware that what we have been able to contribute towards the explanation of the libidinal structure of groups leads back to the distinction between the ego and the ego ideal and to the double kind of tie which this makes possible — identification, and substitution of the object for the ego ideal. The assumption of this kind of differentiating grade [*Stufe*] in the ego as a first step in an analysis of the ego must gradually establish its justification in the most various regions of psychology. In my paper 'Zur Einführung des Narzissmus' I have put together all the pathological material that could at the moment be used in support of this separation. But it may be expected that when we penetrate deeper into the psychology of the psychoses its significance will be discovered to be far greater. Let us reflect that the ego now appears in the relation of an object to the ego ideal which has been developed out of it, and that all the interplay between an outer object and the ego as a whole, with which our study of the neuroses has made us acquainted, may possibly be repeated upon this new scene of action inside the ego.

In this place I shall only follow up one of the consequences which seem possible from this point of view, thus resuming the discussion of a problem which I was obliged to leave unsolved elsewhere. Each of the mental differentiations that we have become acquainted with represents a fresh aggravation of the difficulties of mental functioning, increases its instability, and may become the starting-point for its breakdown, that is, for the onset of a disease. Thus, by being born we have made the step from an absolutely self-sufficient narcissism to the perception of a changing outer world and to the beginnings of the discovery of objects. And with this is associated the fact that we cannot endure the new state of things for long, that we periodically revert from it, in our sleep, to our former condition of absence of stimulation and avoidance of objects. It is true, however, that in this we are following a hint from the outer world, which, by means of the periodical change of day and night, temporarily withdraws the greater part of the stimuli that affect us. The second example, which is pathologically more important, is not subject to any such qualification. In the course of our development we have effected a separation of our mental existence into a coherent ego and into an unconscious and repressed portion which is left outside it; and we know that the stability of this new acquisition is exposed to constant shocks. In dreams and in neuroses what is thus excluded knocks for admission at the gates, guarded though they

are by resistances; and in our waking health we make use of special artifices for allowing what is repressed to circumvent the resistances and for receiving it temporarily into our ego to the increase of our pleasure. Wit and humour, and to some extent the comic in general, may be regarded in this light. Everyone acquainted with the psychology of the neuroses will think of similar examples of less importance; but I hasten on to the application I have in view.

It is quite conceivable that the separation of the ego ideal from the ego cannot be borne for long either, and has to be temporarily undone. In all renunciations and limitations imposed upon the ego a periodical infringement of the prohibition is the rule; this indeed is shown by the institution of festivals, which in origin are nothing more nor less than excesses provided by law and which owe their cheerful character to the release which they bring. The Saturnalia of the Romans and our modern carnival agree in this essential feature with the festivals of primitive people, which usually end in debaucheries of every kind and the transgression of what are at other times the most sacred commandments. But the ego ideal comprises the sum of all the limitations in which the ego has to acquiesce, and for that reason the abrogation of the ideal would necessarily be a magnificent festival for the ego, which might then once again feel satisfied with itself.

There is always a feeling of triumph when something in the ego coincides with the ego ideal. And the sense of guilt (as well as the sense of inferiority) can also be understood as an expression of tension between the ego and the ego ideal.

It is well known that there are people the general colour of whose mood oscillates periodically from an excessive depression through some kind of intermediate state to an exalted sense of well-being. These oscillations appear in very different degrees of amplitude, from what is just noticeable to those extreme instances which, in the shape of melancholia and mania, make the most painful or disturbing inroads upon the life of the person concerned. In typical cases of this cyclical depression outer exciting causes do not seem to play any decisive part; as regards inner motives, nothing more (or nothing different) is to be found in these patients than in all others. It has consequently become the custom to consider these cases as not being psychogenic. We shall refer later on to those other exactly

similar cases of cyclical depression which can nevertheless easily be traced back to mental traumata.

Thus the foundation of these spontaneous oscillations of mood is unknown; we are without insight into the mechanism of the displacement of a melancholia by a mania. So we are free to suppose that these patients are people in whom our conjecture might find an actual application — their ego ideal might be temporarily resolved into their ego after having previously ruled it with especial strictness.

Let us keep to what is clear: On the basis of our analysis of the ego it cannot be doubted that in cases of mania the ego and the ego ideal have fused together, so that the person, in a mood of triumph and self-satisfaction, disturbed by no self-criticism, can enjoy the abolition of his inhibitions, his feelings of consideration for others, and his self-reproaches. It is not so obvious, but nevertheless very probable, that the misery of the melancholiac is the expression of a sharp conflict between the two faculties of his ego, a conflict in which the ideal, in an excess of sensitiveness, relentlessly exhibits its condemnation of the ego in delusions of inferiority and in self-depreciation. The only question is whether we are to look for the causes of these altered relations between the ego and the ego ideal in the periodic rebellions, which we have postulated above, against the new institution, or whether we are to make other circumstances responsible for them.

A change into mania is not an indispensable feature of the symptomatology of melancholic depression. There are simple melancholias, some in single and some in recurring attacks, which never show this development. On the other hand there are melancholias in which the exciting cause clearly plays an aetiological part. They are those which occur after the loss of a loved object, whether by death or as a result of circumstances which have necessitated the withdrawal of the libido from the object. A psychogenic melancholia of this sort can end in mania, and this cycle can be repeated several times, just as easily as in a case which appears to be spontaneous. Thus the state of things is somewhat obscure, especially as only a few forms and cases of melancholia have been submitted to psycho-analytical investigation. So far we only understand those cases in which the object is given up because it has shown itself unworthy of love. It is then set up again inside the ego, by means of identification, and severely condemned by the ego ideal. The reproaches

and attacks directed towards the object come to light in the shape of melancholic self-reproaches.

A melancholia of this kind may also end in a change to mania; so that the possibility of this happening represents a feature which is independent of the other characteristics in the symptomatology.

Nevertheless I see no difficulty in assigning to the factor of the periodical rebellion of the ego against the ego ideal a share in both kinds of melancholia, the psychogenic as well as the spontaneous. In the spontaneous kind it may be supposed that the ego ideal is inclined to display a peculiar strictness, which then results automatically in its temporary suspension. In the psychogenic kind the ego would be incited to rebellion by ill-treatment on the part of its ideal — an ill-treatment which it encounters when there has been identification with a rejected object.

XII. POSTSCRIPT

In the course of the enquiry which has just been brought to a provisional end we came across a number of side-paths which we avoided pursuing in the first instance but in which there was much that offered us promises of insight. We propose now to take up a few of the points that have been left on one side in this way.

A. The distinction between identification of the ego with an object and replacement of the ego ideal by an object finds an interesting illustration in the two great artificial groups which we began by studying, the army and the Christian church.

It is obvious that a soldier takes his superior, that is, really, the leader of the army, as his ideal, while he identifies himself with his equals, and derives from this community of their egos the obligations for giving mutual help and for sharing possessions which comradeship implies. But he becomes ridiculous if he tries to identify himself with the general. The soldier in *Wallensteins Lager* laughs at the sergeant for this very reason:

> Wie er räuspert und wie er spuckt,
> Das habt ihr ihm glücklich abgeguckt!

It is otherwise in the Catholic Church. Every Christian loves Christ as his ideal and feels himself united with all other Christians by the tie of identification. But the Church requires more of him. He has also to identify himself with Christ and love all other Christians as Christ loved them. At both points, therefore, the Church requires that the position of the libido which is given by a group formation should be supplemented. Identification has to be added where object-choice has taken place, and object love where there is identification. This addition evidently goes beyond the constitution of the group. One can be a good Christian and yet be far from the idea of putting oneself in Christ’s place and of having like him an all-embracing love for mankind. One need not think oneself capable, weak mortal that one is, of the Saviour’s largeness of soul and strength of love. But this further development in the distribution of libido in the group is probably the factor upon which Christianity bases its claim to have reached a higher ethical level.

B. We have said that it would be possible to specify the point in the mental development of man at which the advance from group to individual psychology was also achieved by the individual members of the group.

For this purpose we must return for a moment to the scientific myth of the father of the primal horde. He was later on exalted into the creator of the world, and with justice, for he had produced all the sons who composed the first group. He was the ideal of each one of them, at once feared and honoured, a fact which led later to the idea of taboo. These many individuals eventually banded themselves together, killed him and cut him in pieces. None of the group of victors could take his place, or, if one of them did, the battles began afresh, until they understood that they must all renounce their father's heritage. They then formed the totemistic community of brothers, all with equal rights and united by the totem prohibitions which were to preserve and to expiate the memory of the murder. But the dissatisfaction with what had been achieved still remained, and it became the source of new developments. The persons who were united in this group of brothers gradually came towards a revival of the old state of things at a new level. Man became once more the chief of a family, and broke down the prerogatives of the gynaecocracy which had become established during the fatherless period. As a compensation for this he may at that time have acknowledged the mother deities, whose priests were castrated for the mother's protection, after the example that had been given by the father of the primal horde. And yet the new family was only a shadow of the old one; there were numbers of fathers and each one was limited by the rights of the others.

It was then, perhaps, that some individual, in the exigency of his longing, may have been moved to free himself from the group and take over the father's part. He who did this was the first epic poet; and the advance was achieved in his imagination. This poet disguised the truth with lies in accordance with his longing. He invented the heroic myth. The hero was a man who by himself had slain the father — the father who still appeared in the myth as a totemistic monster. Just as the father had been the boy's first ideal, so in the hero who aspires to the father's place the poet now created the first ego ideal. The transition to the hero was probably afforded by the youngest son, the mother's favourite, whom she had protected from paternal jealousy, and who, in the era of the primal horde, had been the father's successor. In the lying poetic fancies of

prehistoric times the woman, who had been the prize of battle and the allurement to murder, was probably turned into the seducer and instigator to the crime.

The hero claims to have acted alone in accomplishing the deed, which certainly only the horde as a whole would have ventured upon. But, as Rank has observed, fairy tales have preserved clear traces of the facts which were disavowed. For we often find in them that the hero who has to carry out some difficult task (usually a youngest son, and not infrequently one who has represented himself to the father surrogate as being stupid, that is to say, harmless) — we often find, then, that this hero can carry out his task only by the help of a crowd of small animals, such as bees or ants. These would be the brothers in the primal horde, just as in the same way in dream symbolism insects or vermin signify brothers and sisters (contemptuously, considered as babies). Moreover every one of the tasks in myths and fairy tales is easily recognisable as a substitute for the heroic deed.

The myth, then, is the step by which the individual emerges from group psychology. The first myth was certainly the psychological, the hero myth; the explanatory nature myth must have followed much later. The poet who had taken this step and had in this way set himself free from the group in his imagination, is nevertheless able (as Rank has further observed) to find his way back to it in reality. For he goes and relates to the group his hero's deeds which he has invented. At bottom this hero is no one but himself. Thus he lowers himself to the level of reality, and raises his hearers to the level of imagination. But his hearers understand the poet, and, in virtue of their having the same relation of longing towards the primal father, they can identify themselves with the hero.

The lie of the heroic myth culminates in the deification of the hero. Perhaps the deified hero may have been earlier than the Father God and may have been a precursor to the return of the primal father as a deity. The series of gods, then, would run chronologically: Mother Goddess — Hero — Father God. But it is only with the elevation of the never forgotten primal father that the deity acquires the features that we still recognise in him to-day.

C. A great deal has been said in this paper about directly sexual instincts and those that are inhibited in their aims, and it may be hoped that this distinction will not meet with too much resistance. But a detailed

discussion of the question will not be out of place, even if it only repeats what has to a great extent already been said before.

The development of the libido in children has made us acquainted with the first but also the best example of sexual instincts which are inhibited in their aims. All the feelings which a child has towards its parents and those who look after it pass by an easy transition into the wishes which give expression to the child's sexual tendencies. The child claims from these objects of its love all the signs of affection which it knows of; it wants to kiss them, touch them, and look at them; it is curious to see their genitals, and to be with them when they perform their intimate excremental functions; it promises to marry its mother or nurse — whatever it may understand by that; it proposes to itself to bear its father a child, etc. Direct observation, as well as the subsequent analytic investigation of the residue of childhood, leave no doubt as to the complete fusion of tender and jealous feelings and of sexual intentions, and show us in what a fundamental way the child makes the person it loves into the object of all its incompletely centred sexual tendencies.

This first configuration of the child's love, which in typical cases is co-ordinated with the Oedipus complex, succumbs, as we know, from the beginning of the period of latency onwards to a wave of repression. Such of it as is left over shows itself as a purely tender emotional tie, which relates to the same people, but is no longer to be described as 'sexual'. Psycho-analysis, which illuminates the depths of mental life, has no difficulty in showing that the sexual ties of the earliest years of childhood also persist, though repressed and unconscious. It gives us courage to assert that wherever we come across a tender feeling it is the successor to a completely 'sensual' object tie with the person in question or rather with that person's prototype (or *imago*). It cannot indeed disclose to us without a special investigation whether in a given case this former complete sexual current still exists under repression or whether it has already been exhausted. To put it still more precisely: it is quite certain that it is still there as a form and possibility, and can always be charged with cathectic energy and put into activity again by means of regression; the only question is (and it cannot always be answered) what degree of cathexis and operative force it still has at the present moment. Equal care must be taken in this connection to avoid two sources of error — the Scylla of under-

estimating the importance of the repressed unconscious, and the Charybdis of judging the normal entirely by the standards of the pathological.

A psychology which will not or cannot penetrate the depths of what is repressed regards tender emotional ties as being invariably the expression of tendencies which have no sexual aim, even though they are derived from tendencies which have such an aim.

We are justified in saying that they have been diverted from these sexual aims, even though there is some difficulty in giving a representation of such a diversion of aim which will conform to the requirements of metapsychology. Moreover, those instincts which are inhibited in their aims always preserve some few of their original sexual aims; even an affectionate devotee, even a friend or an admirer, desires the physical proximity and the sight of the person who is now loved only in the 'Pauline' sense. If we choose, we may recognise in this diversion of aim a beginning of the *sublimation* of the sexual instincts, or on the other hand we may fix the limits of sublimation at some more distant point. Those sexual instincts which are inhibited in their aims have a great functional advantage over those which are uninhibited. Since they are not capable of really complete satisfaction, they are especially adapted to create permanent ties; while those instincts which are directly sexual incur a loss of energy each time they are satisfied, and must wait to be renewed by a fresh accumulation of sexual libido, so that meanwhile the object may have been changed. The inhibited instincts are capable of any degree of admixture with the uninhibited; they can be transformed back into them, just as they arose out of them. It is well known how easily erotic wishes develop out of emotional relations of a friendly character, based upon appreciation and admiration, (compare Molière's 'Embrassez-moi pour l'amour du grec'), between a master and a pupil, between a performer and a delighted listener, and especially in the case of women. In fact the growth of emotional ties of this kind, with their purposeless beginnings, provides a much frequented pathway to sexual object-choice. Pfister, in his *Frömmigkeit des Grafen von Zinzendorf*, has given an extremely clear and certainly not an isolated example of how easily even an intense religious tie can revert to ardent sexual excitement. On the other hand it is also very usual for directly sexual tendencies, short-lived in themselves, to be transformed into a lasting and purely tender tie; and the consolidation of a passionate love marriage rests to a large extent upon this process.

We shall naturally not be surprised to hear that the sexual tendencies that are inhibited in their aims arise out of the directly sexual ones when inner or outer obstacles make the sexual aims unattainable. The repression during the period of latency is an inner obstacle of this kind — or rather one which has become inner. We have assumed that the father of the primal horde owing to his sexual intolerance compelled all his sons to be abstinent, and thus forced them into ties that were inhibited in their aims, while he reserved for himself freedom of sexual enjoyment and in this way remained without ties. All the ties upon which a group depends are of the character of instincts that are inhibited in their aims. But here we have approached the discussion of a new subject, which deals with the relation between directly sexual instincts and the formation of groups.

D. The last two remarks will have prepared us for finding that directly sexual tendencies are unfavourable to the formation of groups. In the history of the development of the family there have also, it is true, been group relations of sexual love (group marriages); but the more important sexual love became for the ego, and the more it developed the characteristics of being in love, the more urgently it required to be limited to two people — *una cum uno* — as is prescribed by the nature of the genital aim. Polygamous inclinations had to be content to find satisfaction in a succession of changing objects.

Two people coming together for the purpose of sexual satisfaction, in so far as they seek for solitude, are making a demonstration against the herd instinct, the group feeling. The more they are in love, the more completely they suffice for each other. The rejection of the group's influence is manifested in the shape of a sense of shame. The extremely violent feelings of jealousy are summoned up in order to protect the sexual object-choice from being encroached upon by a group tie. It is only when the tender, that is, the personal, factor of a love relation gives place entirely to the sensual one, that it is possible for two people to have sexual intercourse in the presence of others or for there to be simultaneous sexual acts in a group as occurs at an orgy. But at that point a regression has taken place to an early stage in sexual relations, at which being in love as yet played no part, and all sexual objects were judged to be of equal value, somewhat in the sense of Bernard Shaw's malicious aphorism to the effect that being in love means greatly exaggerating the difference between one woman and another.

There are abundant indications that being in love only made its appearance late on in the sexual relations between men and women; so that the opposition between sexual love and group ties is also a late development. Now it may seem as though this assumption were incompatible with our myth of the primal family. For it was after all by their love for their mothers and sisters that the troop of brothers was, as we have supposed, driven to parricide; and it is difficult to imagine this love as being anything but unbroken and primitive — that is, as an intimate union of the tender and the sensual. But further consideration resolves this objection into a confirmation. One of the reactions to the parricide was after all the institution of totemistic exogamy; the prohibition of any sexual relation with those women of the family who had been tenderly loved since childhood. In this way a wedge was driven in between a man's tender and sensual feelings, one still firmly fixed in his erotic life to-day. As a result of this exogamy the sensual needs of men had to be satisfied with strange and unloved women.

In the great artificial groups, the church and the army, there is no room for woman as a sexual object. The love relation between men and women remains outside these organisations. Even where groups are formed which are composed of both men and women the distinction between the sexes plays no part. There is scarcely any sense in asking whether the libido which keeps groups together is of a homosexual or of a heterosexual nature, for it is not differentiated according to the sexes, and particularly shows a complete disregard for the aims of the genital organisation of the libido.

Even in a person who has in other respects become absorbed in a group the directly sexual tendencies preserve a little of his individual activity. If they become too strong they disintegrate every group formation. The Catholic Church had the best of motives for recommending its followers to remain unmarried and for imposing celibacy upon its priests; but falling in love has often driven even priests to leave the church. In the same way love for women breaks through the group ties of race, of national separation, and of the social class system, and it thus produces important effects as a factor in civilization. It seems certain that homosexual love is far more compatible with group ties, even when it takes the shape of uninhibited sexual tendencies — a remarkable fact, the explanation of which might carry us far.

The psycho-analytic investigation of the psycho-neuroses has taught us that their symptoms are to be traced back to directly sexual tendencies which are repressed but still remain active. We can complete this formula by adding to it: or, to tendencies inhibited in their aims, whose inhibition has not been entirely successful or has made room for a return to the repressed sexual aim. It is in accordance with this that a neurosis should make its victim asocial and should remove him from the usual group formations. It may be said that a neurosis has the same disintegrating effect upon a group as being in love. On the other hand it appears that where a powerful impetus has been given to group formation, neuroses may diminish and at all events temporarily disappear. Justifiable attempts have also been made to turn this antagonism between neuroses and group formation to therapeutic account. Even those who do not regret the disappearance of religious illusions from the civilized world of to-day will admit that so long as they were in force they offered those who were bound by them the most powerful protection against the danger of neurosis. Nor is it hard to discern in all the ties with mystico-religious or philosophico-religious sects and communities the manifestation of distorted cures of all kinds of neuroses. All of this is bound up with the contrast between directly sexual tendencies and those which are inhibited in their aims.

If he is left to himself, a neurotic is obliged to replace by his own symptom formations the great group formations from which he is excluded. He creates his own world of imagination for himself, his religion, his own system of delusions, and thus recapitulates the institutions of humanity in a distorted way which is clear evidence of the dominating part played by the directly sexual tendencies.

E. In conclusion, we will add a comparative estimate, from the standpoint of the libido theory, of the states with which we have been concerned, of being in love, of hypnosis, of group formation, and of the neurosis.

Being in love is based upon the simultaneous presence of directly sexual tendencies and of sexual tendencies that are inhibited in their aims, so that the object draws a part of the narcissistic ego-libido to itself. It is a condition in which there is only room for the ego and the object.

Hypnosis resembles being in love in being limited to these two persons, but it is based entirely upon sexual tendencies that are inhibited in their aims and substitutes the object for the ego ideal.

The group multiplies this process; it agrees with hypnosis in the nature of the instincts which hold it together, and in the replacement of the ego ideal by the object; but to this it adds identification with other individuals, which was perhaps originally made possible by their having the same relation to the object.

Both states, hypnosis and group formation, are an inherited deposit from the phylogenesis of the human libido — hypnosis in the form of a predisposition, and the group, besides this, as a direct survival. The replacement of the directly sexual tendencies by those that are inhibited in their aims promotes in both states a separation between the ego and the ego ideal, a separation with which a beginning has already been made in the state of being in love.

The neurosis stands outside this series. It also is based upon a peculiarity in the development of the human libido — the twice repeated start made by the directly sexual function, with an intervening period of latency. To this extent it resembles hypnosis and group formation in having the character of a regression, which is absent from being in love. It makes its appearance wherever the advance from directly sexual instincts to those that are inhibited in their aims has not been completely successful; and it represents a *conflict* between those instincts which have been received into the ego after having passed through this development and those portions of the same instincts which, like other instinctive desires that have been completely repressed, strive, from the repressed unconscious, to attain direct satisfaction. The neurosis is extraordinarily rich in content, for it embraces all possible relations between the ego and the object — both those in which the object is retained and others in which it is abandoned or erected inside the ego itself — and also the conflicting relations between the ego and its ego ideal.

A YOUNG GIRL'S DIARY

EDITOR’S NOTE

PREFACE

THE best preface to this journal written by a young girl belonging to the upper middle class is a letter by Sigmund Freud dated April 27, 1915, a letter wherein the distinguished Viennese psychologist testifies to the permanent value of the document:

"This diary is a gem. Never before, I believe, has anything been written enabling us to see so clearly into the soul of a young girl, belonging to our social and cultural stratum, during the years of puberal development. We are shown how the sentiments pass from the simple egoism of childhood to attain maturity; how the relationships to parents and other members of the family first shape themselves, and how they gradually become more serious and more intimate; how friendships are formed and broken. We are shown the dawn of love, feeling out towards its first objects. Above all, we are shown how the mystery of the sexual life first presses itself vaguely on the attention, and then takes entire possession of the growing intelligence, so that the child suffers under the load of secret knowledge but gradually becomes enabled to shoulder the burden. Of all these things we have a description at once so charming, so serious, and so artless, that it cannot fail to be of supreme interest to educationists and psychologists.

"It is certainly incumbent on you to publish the diary. All students of my own writings will be grateful to you."

In preparing these pages for the press, the editor has toned down nothing, has added nothing, and has suppressed nothing. The only alterations she has made have been such as were essential to conceal the identity of the writer and of other persons mentioned in the document. Consequently, surnames, Christian names, and names of places, have been changed. These modifications have enabled the original author of the diary to allow me to place it at the free disposal of serious readers.

No attempt has been made to correct trifling faults in grammar and other inelegancies of style. For the most part, these must not be regarded as the expression of a child's incapacity for the control of language. Rather must they be looked upon as manifestations of affective trends, as errors in functioning brought about by the influence of the Unconscious.

THE EDITOR. VIENNA, *Autumn,* 1919.

FIRST YEAR, AGE ELEVEN TO TWELVE

FIRST YEAR

July 12, 19 . . . Hella and I are writing a diary. We both agreed that when we went to the high school we would write a diary every day. Dora keeps a diary too, but she gets furious if I look at it. I call Helene “Hella,” and she calls me “Rita;” Helene and Grete are so vulgar. Dora has taken to calling herself “Thea,” but I go on calling her “Dora.” She says that little children (she means me and Hella) ought not to keep a diary. She says they will write such a lot of nonsense. No more than in hers and Lizzi’s.

July 13th. Really we were not to begin writing until after the holidays, but since we are both going away, we are beginning now. Then we shall know what we have been doing in the holidays.

The day before yesterday we had an entrance examination, it was very easy, in dictation I made only 1 mistake — writing *ihn* without *h*. The mistress said that didn’t matter, I had only made a slip. That is quite true, for I know well enough that *ihn* has an *h* in it. We were both dressed in white with rose-coloured ribbons, and everyone believed we were sisters or at least cousins. It would be very nice to have a cousin. But it’s still nicer to have a friend, for we can tell one another everything.

July 14th. The mistress was very kind. Because of her Hella and I are really sorry that we are not going to a middle school. Then every day before lessons began we could have had a talk with her in the class-room. But we’re awfully pleased because of the other girls. One is more important when one goes to the high school instead of only to the middle school. That is why the girls are in such a rage. “They are bursting with pride” (that’s what my sister says of me and Hella, but it is not true). “Our two students” said the mistress when we came away. She told us to write to her from the country. I shall.

July 15th. Lizzi, Hella’s sister, is not so horrid as Dora, she is always so nice! To-day she gave each of us at least ten chocolate-creams. It’s true Hella often says to me: “You don’t know her, what a beast she can be. *Your* sister is generally very nice to me.” Certainly it is very funny the way in which she always speaks of us as “the little ones” or “the children,” as if she had never been a child herself, and indeed a much littler one than we

are. Besides we're just the same as she is now. She is in the fourth class and we are in the first.

To-morrow we are going to Kaltenbach in Tyrol. I'm frightfully excited. Hella went away to-day to Hungary to her uncle and aunt with her mother and Lizzi. Her father is at manoeuvres.

July 19th. It's awfully hard to write every day in the holidays. Everything is so new and one has no time to write. We are living in a big house in the forest. Dora bagged the front veranda straight off for her own writing. At the back of the house there are such swarms of horrid little flies; everything is black with flies. I do hate flies and such things. I'm not going to put up with being driven out of the front veranda. I won't have it. Besides, Father said: "Don't quarrel, children!" (*Children* to *her* too!!) He's quite right. She puts on such airs because she'll be fourteen in October. "The verandas are common property," said Father. Father's always so just. He never lets Dora lord it over me, but Mother often makes a favourite of Dora. I'm writing to Hella to-day. She's not written to me yet.

July 21st. Hella has written to me, 4 pages, and such a jolly letter. I don't know what I should do without her! Perhaps she will come here in August or perhaps I shall go to stay with her. I think I would rather go to stay with her. I like paying long visits. Father said: "We'll see," and that means he'll let me go. When Father and Mother say We'll see it really means Yes; but they won't say "yes" so that if it does not come off one can't say that they haven't kept their word. Father really lets me do anything I like, but not Mother. Still, if I practice my piano regularly perhaps she'll let me go. I must go for a walk.

July 22nd. Hella wrote that I positively must write every day, for one must keep a promise and we swore to write every day. I. . . .

July 23rd. It's awful. One has no time. Yesterday when I wanted to write the room had to be cleaned and D. was in the arbour. Before that I had not written a *single* word and in the front veranda all my pages blew away. We write on loose pages. Hella thinks it's better because then one does not have to tear anything out. But we have promised one another to throw nothing away and not to tear anything up. Why should we? One can tell a friend everything. A pretty friend if one couldn't. Yesterday when I wanted to go into the arbour Dora glared at me savagely, saying What do

you want? As if the arbour belonged to her, just as she wanted to bag the front veranda all for herself. She's too sickening.

Yesterday afternoon we were on the Kolber-Kogel. It was lovely. Father was awfully jolly and we pelted one another with pine-cones. It was jolly. I threw one at Dora and it hit her on her padded bust. She let out such a yell and I said out loud You couldn't feel it *there*. As she went by she said Pig! It doesn't matter, for I know she understood me and that what I said was true. I should like to know what *she* writes about every day to Erika and what she writes in her diary. Mother was out of sorts and stayed at home.

July 24th. To-day is Sunday. I do love Sundays. Father says: You children have Sundays every day. That's quite true in the holidays, but not at other times. The peasants and their wives and children are all very gay, wearing Tyrolese dresses, just like those I have seen in the theatre. We are wearing our white dresses to-day, and I have made a great cherrystain upon mine, not on purpose, but because I sat down upon some fallen cherries. So this afternoon when we go out walking I must wear my pink dress. All the better, for I don't care to be dressed exactly the same as Dora. I don't see why everyone should know that we are sisters. Let people think we are cousins. She does not like it either; I wish I knew why.

Oswald is coming in a week, and I am awfully pleased. He is older than Dora, but I can always get on with him. Hella writes that she finds it dull without me; so do I.

July 25th. I wrote to Fraulein Pruckl to-day. She is staying at Achensee. I should like to see her. Every afternoon we bathe and then go for a walk. But to-day it has been raining all day. Such a bore. I forgot to bring my paint-box and I'm not allowed to read all day. Mother says, if you gobble all your books up now you'll have nothing left to read. That's quite true, but I can't even go and swing.

Afternoon. I must write some more. I've had a frightful row with Dora. She says I've been fiddling with her things. It's all because she's so untidy. As if *her* things could interest me. Yesterday she left her letter to Erika lying about on the table, and all I read was: He's as handsome as a Greek god. I don't know who "he" was for she came in at that moment. It's probably Krail Rudi, with whom she is everlastingly playing tennis and carries on like anything. As for handsome — well, there's no accounting for tastes.

July 26th. It's a good thing I brought my dolls' portmanteau. Mother said: You'll be glad to have it on rainy days. Of course I'm much too old to play with dolls, but even though I'm 11 I can make dolls' clothes still. One learns something while one is doing it, and when I've finished something I do enjoy it so. Mother cut me out some things and I was tacking them together. Then Dora came into the room and said Hullo, the child is sewing things for her dolls. What cheek, as if she had never played with dolls. Besides, I don't really play with dolls any longer. When she sat down beside me I sewed so vigorously that I made a great scratch on her hand, and said: Oh, I'm so sorry, but you came too close. I hope she'll know why I really did it. Of course she'll go and sneak to Mother. Let her. What right has she to call me child. She's got a fine red scratch anyhow, and on her right hand where everyone can see.

July 27th. There's such a lot of fruit here. I eat raspberries and gooseberries all day and Mother says that is why I have no appetite for dinner. But Dr. Klein always says Fruit is so wholesome. But why should it be unwholesome all at once? Hella always says that when one likes anything awfully much one is always scolded about it until one gets perfectly sick of it. Hella often gets in such a temper with her mother, and then her mother says: We make such sacrifices for our children and they reward us with ingratitude. I should like to know what sacrifices they make. I think it's the children who make the sacrifices. When I want to eat gooseberries and am not allowed to, the sacrifice is *mine* not *Mother's*. I've written all this to Hella. Fraulein Pruckl has written to me. The address on her letter to me was splendid, "Fraulein Grete Lainer, Lyzealschulerin." Of course Dora had to know better than anyone else, and said that in the higher classes from the fourth upwards (because she is in the fourth) they write "Lyzeistin." She said: "Anyhow, in the holidays, before a girl has attended the first class she's not a Lyzealschulerin at all." Then Father chipped in, saying that *we* (*I* didn't begin it) really must stop this eternal wrangling; he really could not stand it. He's quite right, but what he said won't do any good, for Dora will go on just the same. Fraulein Pruckl wrote that she was *delighted* that I had written. As soon as I have time she wants me to write to her again. Great Scott, I've always time for *her*. I shall write to her again this evening after supper, so as not to keep her waiting.

July 29th. I simply could not write yesterday. The Warths have arrived, and I had to spend the whole day with Erna and Liesel, although it rained all day. We had a ripping time. They know a lot of round games and we played for sweets. I won 47, and I gave five of them to Dora. Robert is already more than a head taller than we are, I mean than Liesel and me; I think he is fifteen. He says Fraulein Grete and carried my cloak which Mother sent me because of the rain and he saw me home after supper.

To-morrow is my birthday and everyone has been invited and Mother has made strawberry cream and waffles. How spiffing.

July 30th. To-day is my birthday. Father gave me a splendid parasol with a flowered border and painting materials and Mother gave me a huge postcard album for 800 cards and stories for school girls, and Dora gave me a beautiful box of notepaper and Mother had made a chocolate-cream cake for dinner to-day as well as the strawberry cream. The first thing in the morning the Warths sent me three birthday cards. And Robert had written on his: With deepest *respect your faithful R.* It is glorious to have a birthday, everyone is so kind, even Dora. Oswald sent me a wooden paper-knife, the handle is a dragon and the blade shoots out of its mouth instead of flame; or perhaps the blade is its tongue, one can't be quite sure. It has not rained yet on my birthday. Father says I was born under a lucky star. That suits me all right, tip top.

July 31st. Yesterday was heavenly. We laughed till our sides ached over Consequences. I was always being coupled with Robert and oh the things we did together, not really of course but only in writing: kissed, hugged, lost in the forest, bathed together; but I say, I wouldn't do *that!* quarrelled. That won't happen, it's quite impossible! Then we drank my health clinking glasses five times and Robert wanted to drink it in wine but Dora said that would never do! The real trouble was this. She always gets furious if she has to play second fiddle to me and yesterday I was certainly first fiddle.

Now I must write a word about to-day. We've had a splendid time. We were in Tiefengraben with the Warths where there are such a lot of wild strawberries. Robert picked all the best of them for me, to the great annoyance of Dora who had to pick them for herself. Really I would rather pick them for myself, but when some one else picks them for one for *love* (that's what Robert said) then one is quite glad to have them picked for one. Besides, I did pick some myself and gave most of them to Father and

some to Mother. At afternoon tea which we had in Flischberg I had to sit beside Erna instead of Robert. Erna is rather dull. Mother says she is *anemic*; that sounds frightfully interesting, but I don't quite know what it means. Dora is always saying that she is anemic, but of course that is not true. And Father always says "Don't talk such stuff, you're as fit as a fiddle." That puts her in such a wax. Last year Lizzi was really anemic, so the doctor said, she was always having palpitation and had to take iron and drink Burgundy. I think that's where Dora got the idea.

August 1st. Hella is rather cross with me because I wrote and told her that I had spent the whole day with the W's. Still, she is really my only friend or I should not have written and told her. Every year in the country she has another friend too, but that doesn't put me out. I can't understand why she doesn't like Robert; she doesn't know anything about him except what I have written and certainly that was nothing but good. Of course she does know him for he is a cousin of the Sernigs and she met him once there. But one does not get to know a person from seeing them once. Anyhow she does not know him the way I do. Yesterday I was with the Warths all day. We played Place for the King and Robert caught me and I had to give him a kiss. And Erna said, that doesn't count, for I had let myself be caught. But Robert got savage and said: Erna is a perfect nuisance, she spoils everyone's pleasure. He's quite right, but there's some one else just as bad. But I do hope Erna has not told Dora about the kiss. If she has everyone will know and I shouldn't like that. I lay in wait for Erna with the sweets which Aunt Dora sent us. Robert and Liesel and I ate the rest. They were so good and nearly all large ones. At first Robert wanted to take quite a little one, but I said he must only have a big one. After that he always picked out the big ones. When I came home in the evening with the empty box Father laughed and said: There's nothing mean about our Gretel. Besides, Mother still has a great box full; I have no idea whether Dora still has a lot, but I expect so.

August 2nd. Oswald arrived this afternoon at 5. He's a great swell now; he's begun to grow a moustache. In the evening Father took him to the hotel to introduce him to some friends. He said it would be an awful bore, but he will certainly make a good impression especially in his new tourist getup and leather breeches. Grandmama and Grandpapa sent love to all. I've never seen them. They have sent a lot of cakes and sweets and Oswald grumbled no end because he had to bring them. Oswald is always smoking

cigarettes and Father said to him: Come along old chap, we'll go to the inn and have a drink on the strength of your good report. It seems to me rather funny; no one wants to drink anything when Dora and I have a good report, at most they give us a present. Oswald has only Twos and Threes and very few Ones and in Greek nothing but Satisfactory, but I have nothing but Ones. He said something to Father in Latin and Father laughed heartily and said something I could not understand. I don't think it was Latin, but it may have been Magyar or English. Father knows nearly all languages, even Czech, but thank goodness he doesn't talk them unless he wants to tease us. Like that time at the station when Dora and I were so ashamed. Czech is horrid, Mother says so too. When Robert pretends to speak Czech it's screamingly funny.

August 3rd. I got a chill bathing the other day so now I am not allowed to bathe for a few days. Robert keeps me company. We are quite alone and he tells me all sorts of tales. He swings me so high that I positively yell. To-day he made me really angry, for he said: Oswald is a regular noodle. I said, that's not true, boys can never stand one another. Besides, it is not true that he lisps. Anyhow I like Oswald much better than Dora who always says "the children" when she is talking of me and of Hella and even of Robert. Then he said: Dora is just as big a goose as Erna. He's quite right there. Robert says he is never going to smoke, that it is so vulgar, that real gentlemen never smoke. But what about Father, I should like to know? He says, too, that he will never grow a beard but will shave every day and his wife will have to put everything straight to him. But a beard suits Father and I can't imagine him without a beard. I know I won't marry a man without a beard.

August 5th. We go to the tennis ground every day. When we set off yesterday, Robert and I and Liesel and Erna and Rene, Dora called after us: The bridal pair in spee. She had picked up the phrase from Oswald. I think it means in a hundred years. *She* can wait a hundred years if she likes, we shan't. Mother scolded her like anything and said she mustn't say such stupid things. A good job too; in spee, in spee. Now we always talk of her as Inspee, but no one knows who we mean.

August 6th. Hella can't come here, for she is going to Klausenburg with her mother to stay with her other uncle who is district judge there or whatever they call a district judge in Hungary. Whenever I think of a district judge I think of District Judge T., such a hideous man. What a nose

and his wife is so lovely; but her parents forced her into the marriage. I would not let anyone force me into such a marriage, I would much sooner not marry at all, besides she's awfully unhappy.

August 7th. There has been such a fearful row about Dora. Oswald told Father that she flirted so at the tennis court and he could not stand it. Father was in a towering rage and now we mayn't play tennis any more. What upset her more than anything was that Father said in front of me: This little chit of 14 is already encouraging people to make love to her. Her eyes were quite red and swollen and she couldn't eat anything at supper because she had such a *headache!!* We know all about her headaches. But I really can't see why I shouldn't go and play tennis.

August 8th. Oswald says that it wasn't the student's fault at all but only Dora's. I can quite believe that when I think of that time on the Southern Railway. Still, they won't let me play tennis any more, though I begged and begged Mother to ask Father to let me. She said it would do no good for Father was very angry and I mustn't spend whole days with the Warths any more. Whole days! I should like to know when I was a whole day there. When I went there naturally I had to stay to dinner at least. What have I got to do with Dora's love affairs? It's really too absurd. But grown-ups are always like that. When one person has done anything the others have to pay for it too.

August 9th. Thank goodness, I can play tennis once more; I begged and begged until Father let me go. Dora declares that nothing will induce her to ask! That's the old story of the fox and the grapes. She has been playing the invalid lately, won't bathe, and stays at home when she can instead of going for walks. I should like to know what's the matter with her. What I can't make out is why Father lets her do it. As for Mother, she always spoils Dora; Dora is Mother's favourite, especially when Oswald is not on hand. I can understand her making a favourite of Oswald, but not of Dora. Father always says that parents have no favourites, but treat all their children alike. That's true enough as far as Father is concerned, although Dora declares that Father makes a favourite of me; but that's only her fancy. At Christmas and other times we always get the same sort of presents, and that's the real test. Rosa Plank always gets at least three times as much as the rest of the family, that's what it is to be a favourite.

August 12th. I can't write every day for I spend most of my time with the Warths. Oswald can't stand Robert, he says he is a cad and a

greenhorn. What vulgar phrases. For three days I haven't spoken to Oswald except when I really had to. When I told Erna and Liesel about it, they said that brothers were always rude to their sisters. I said, I should like to know why. Besides, Robert is generally very nice to his sisters. They said, Yes before you, because he's on his best behaviour with you. Yesterday we laughed like anything when he told us what fun the boys make of their masters. That story about the cigarette ends was screamingly funny. They have a society called T. Au. M., that is in Latin Be Silent or Die in initial letters. No one may betray the society's secrets, and when they make a new member he has to strip off all his clothes and lie down naked and every one spits on his chest and rubs it and says: Be One of Us, but all in Latin. Then he has to go to the eldest and biggest who gives him two or three cuts with a cane and he has to swear that he will never betray anyone. Then everyone smokes a cigar and touches him with the lighted end on the arm or somewhere and says: Every act of treachery will burn you like that. And then the eldest, who has a special name which I can't remember, tattoos on him the word Taum, that is Be Silent or Die, and a heart with the name of a girl. Robert says that if he had known me sooner he would have chosen "Gretchen." I asked him what name he had tattooed on him, but he said he was not allowed to tell. I shall tell Oswald to look when they are bathing and to tell me. In this society they abuse the masters frightfully and the one who thinks of the best tricks to play on them is elected to the Rohon; to be a Rohon is a great distinction and the others must always carry out his orders. He said there was a lot more which he couldn't tell me because it's too tremendous. Then I had to swear that I would never tell anyone about the society and he wanted me to take the oath upon my knees, but I wouldn't do that and he nearly forced me to my knees. In the end I had to give him my hand on it and a kiss. I didn't mind giving him that, for a kiss is nothing, but nothing would induce me to kneel down. Still, I was in an awful fright, for we were quite alone in the garden and he took me by the throat and tried to force me to my knees. All that about the *society* he told me when we were quite alone for he said: I can't have your name tattooed on me because it's against our laws to have two names but now that you have sworn I can let you know what I really am and think in secret.

I couldn't sleep all night for I kept on dreaming of the society, wondering whether there are such societies in the high school and whether

Dora is in a society and has a name tattooed on her. But it would be horrible to have to strip naked before all one's schoolfellows. Perhaps in the societies of the high-school girls that part is left out. But I shouldn't like to say for sure whether I'd have Robert's name tattooed on me.

August 15th. Yesterday Robert told me that there are some schoolboy societies where they do very improper things, but that never happened in their society. But he didn't say what. I said, the stripping naked seems to me awful; but he said, Oh, that's nothing, that must happen if we're to trust one another, it's all right as long as there's nothing improper. I wish I knew what. I wish I knew whether Oswald knows about it, and whether he is in such a society or in a proper one and whether Father was in one. If I could only find out. But I can't ask, for if I did I should betray Robert. When he sees me he always presses my left wrist without letting anyone see. He said that is the warning to me to be silent. But he needn't do that really, for I never would betray him whatever happened. He said: The pain is to bind you to me. When he says that his eyes grow dark, quite black, although his eyes are really grey and they get very large. Especially in the evening when we say goodbye, it frightens me. I'm always dreaming of him.

August 18th. Yesterday evening we had illuminations in honour of the emperor's birthday. We didn't get home until half past twelve. At first we went to a concert in the park and to the illuminations. They fired salutes from the hills and there were beacons flaring on the hill-tops; it was rather creepy although it was wonderful. My teeth chattered once or twice, I don't know whether I was afraid something would happen or why it was. Then R. came and talked such a lot. He is set on going into the army. For that he needn't learn so much, and what he's learning now is of no use to him. He says that doesn't matter, that knowledge will give him a great pull. I don't think he looks stupid, though Oswald says so to make me angry. All at once we found ourselves quite away from the others and so we sat on a bench to wait for them. Then I asked R. once more about the other societies, the ones in which they do such improper things. But he wouldn't tell me for he said he would not rob me of my innocence. I thought that very stupid, and I said that perhaps he didn't know himself and it was all put on. All that happened, he said, was that anyone who joined the society was tickled until he couldn't stand it any longer. And once one of them got St. Vitus's dance, that is frightful convulsions and

they were afraid that everything would come out. And since then in their society no more tickling had been allowed. Shall I tickle you a little? I don’t understand you, I said, and anyhow you daren’t.

He gave a great laugh and suddenly he seized me and tickled me under the arm. It made me want to laugh frightfully, but I stifled it for there were still lots of people going by. So he gave that up and tickled my hand. I liked it at first, but then I got angry and dragged my hand away. Just then Inspee went by with two other girls and directly they had passed us we followed close behind as if we had been walking like that all the time. It saved me a wigging from Mother, for she always wants us all to keep together. As we went along R. said: Look out, Gretel, I’m going to tickle you some day until you scream. — How absurd, I won’t have it, it takes two to do that.

By the way, in the raffle I won a vase with 2 turtledoves and a bag of sweets and R. won a knife, fork and spoon. That annoyed him frightfully. Inspee won a fountain pen, just what I want, and a mirror which makes one look a perfect fright. A good job too, for she fancies herself such a lot.

August 29th. O dear, such an awful thing has happened. I have lost pages 30 to 34 from my diary. I must have left them in the garden, or else on the Louisenhohe. It’s positively fiendish. If anyone was to find them. And I don’t know exactly what there was on those pages. I was born to ill luck. If I hadn’t promised Hella to write my diary every day I should like to give up the whole thing. Fancy if Mother were to get hold of it, or even Father. And it’s raining so fearfully to-day that I can’t even go into the garden and still less on the Louisenhohe above all not alone. I must have lost it the day before yesterday, for I didn’t write anything yesterday or the day before. It would be dreadful if anyone were to find it. I am so much upset that I couldn’t eat anything at dinner, although we had my favourite chocolate cream cake. And I’m so unhappy for Father was quite anxious and Mother too and they both asked what was the matter with me and I nearly burst out crying before everyone. We had dinner in the hotel to-day because Resi had gone away for 2 days. But I couldn’t cry in the room before Father and Mother for that would have given the show away. My only hope is that no one will recognise my writing, for Hella and I use upright writing for our diary, first of all so that no one may recognise our writing and secondly because upright writing doesn’t use up so much paper as ordinary writing. I do hope it will be fine to-morrow so that I can

hunt in the garden very early. I have been utterly in the dumps all day so that I didn't even get cross when Inspee said: "Have you been quarrelling with your future husband?"

August 30th. It's not in the garden. I begged Mother to let us go to Louisenhutte this afternoon. Mother was awfully nice and asked what I was so worried about, and whether anything had happened. Then I couldn't keep it in any longer and burst out crying. Mother said I must have lost something, and this gave me an awful fright. Mother thought it was Hella's letter, the one which came on Tuesday, so I said: No, much worse than that, my diary. Mother said: Oh well, that's not such a terrible loss, and will be of no interest to anyone. Oh yes, I said, for there are all sorts of things written in it about R. and his society. Look here, Gretel, said Mother, I don't like this way you talk about R.; I really don't like you to spend all your time with the Warths; they're really not our sort and R. is not a fit companion for you; now that you are going to the high school you are not a little girl any longer. Promise me that you'll not be eternally with the Warths. — All right, Mother, I will break it off gradually so that nobody will notice. She burst out laughing and kissed me on both cheeks and promised me to say nothing to Inspee about the diary for she needn't know everything. Mother is such a dear. Still 3 hours and perhaps the pages are still there.

Evening. Thank goodness! In front of the shelter I found 2 pages all pulped by the rain and the writing all run and one page was in the footpath quite torn. Someone must have trodden on it with the heel of his boot and 2 pages had been rolled into a spill and partly burned. So no one had read anything. I am so happy. And at supper Father said: I say, why are your eyes shining with delight? Have you won the big prize in the lottery? and I pressed Mother's foot with mine to remind her not to give me away and Father laughed like anything and said: Seems to me there's a conspiracy against me in my own house. And I said in a great hurry: Luckily we're not in our own house but in a hotel, and everyone laughed and now thank goodness it's all over. Live and learn. I won't let that happen again.

August 31st. Really I'm not so much with the W's and with R. I think he's offended. This afternoon, when I went there to tea, he seized me by the wrist and said: Your father is right, you're a witch. "You need a castigation." How rude of him. Besides, I didn't know what castigation meant. I asked Father and he told me and asked where I had picked up the

word. I said I had passed 2 gentlemen and had heard one of them use it. What I really thought was that castigation meant tickling. But it is really horrid to have no one to talk to. Most of the people have gone already and we have only a week longer. About that castigation business. I don't like fibbing to Father, but I really had to. I couldn't say that R. wanted to give me a castigation when I didn't know what it meant. Dora tells a lot more lies than I do and I always love catching her in a lie for her lies are so obvious. I'm never caught. It only happened once when Frau Oberst von Stary was there. Father noticed that time, for he said: You little rogue, you tarradiddler!

September 3rd. Such a horrid thing has happened. I shall never speak to R. again. Oswald is quite right in calling him a cad. If I had really fallen out of the swing I might have broken my leg 4 days before we have to start from home. I can't make out how it all happened. It was frightful cheek of him to tickle me as he did, and I gave him such a kick. I think it was on his nose or his mouth. Then he actually dared to say: After all I'm well paid out, for what can one expect when one keeps company with such young monkeys, with such babies. Fine talk from him when he's not 14 himself yet. It was all humbug about his being 15 and he seems to be one of the idlest boys in the school, never anything but Satisfactory in his reports, and he's not in the fifth yet, but only in the fourth. Anyhow, we've settled our accounts. Cheeky devil. I shall never tell anyone about it, it will be my first and I hope my last secret from Hella.

September 6th. We are going home to-morrow. The last few days have been awfully dull. I saw R. once or twice but I always looked the other way. Father asked what was wrong between me and the Warths and R., so that our great friendship had been broken off. Of course I had to fib, for it was absolutely *impossible* to tell the truth. I said that R. found fault with everything I did, my writing, my reading aloud. (That's quite true, he did that once) and Father said: Well, well, you'll make it up when you say goodbye to-morrow. Father makes a great mistake. I'll never speak a word to him again.

For her birthday, although it's not come yet, Dora is to have a navy blue silk dustcloak. I don't think the colour suits her, and anyhow she's much too thin to wear a dustcloak.

September 14th. Hella came back the day before yesterday. She looks splendid and she says I do too. I'm so glad that she's back. After all I told

her about R. She was very angry and said I ought to have given him 2 more; one for the tickling and one for the “baby” and one for the “young monkey.” If we should happen to meet him, shan’t we just glare at him.

September 17th. Inspee has really got the silk dustcloak but I think the tartan hood looks rather silly. Still, I didn’t say so, but only that the cloak fitted beautifully. She has tried it on at least five times already. I don’t know whether Father really wants to treat her as a grown-up lady or whether he is making fun of her. I believe he’s only making fun. She doesn’t really look like a grown-up lady. How could she when she’s not 14 yet? Yesterday afternoon such a lot of girls were invited, and of course Hella was invited on my account and we had a grand talk. But most of them bragged frightfully about the country where they *said* they had been. We were 9 girls. But Hella is the only one I care about.

September 21st. School begins to-morrow. By the way, we have agreed to call it Liz [Lyzeum = High School] and not School. I’m frightfully curious.

September 22nd, 19 — . School began to-day. Hella came to fetch me and we went along together. Inspee peached on us to Mother, saying we ran on in front of her. We don’t want her as governess. There are 34 of us in the class. Our teachers are a Frau Doktor, 2 mistresses, one professor, and I think a drawing mistress as well. The Frau Doktor teaches German and writing. She put us together on the 3rd bench. Then she made a speech, then she told us what books to get, but we are not to buy them till Monday. We have 3 intervals, one long and 2 short. The long one is for games, the short ones to go out. I usen’t to go out at the elementary school and now I don’t need to. Mother always says that it’s only a bad habit. Most of the girls went out, and even asked to leave the room during lesson time. To-day we hadn’t any proper lessons. They are to begin to-morrow, but we don’t know what. Then we came home.

September 23rd. To-day we had the mistress who teaches geography and history, she has no degree. Inspee says that she had her last year, but she could not stand her, she’s so ugly. Father was angry and said to Inspee: You silly goose, don’t fill her head with such stuff. Show what you are worth as elder sister. One can learn something from every mistress and every master if one likes. But I can’t say, we’re really fond of Fraulein Vischer and I don’t much care for geography and history. Besides I’m not learning for her but for myself. Frau Dr. Mallburg is awfully nice and

pretty. We shall always write Frau Dr. M. for short. When she laughs she has two dimples and a gold stopping. She is new at the school. I don't know if we are to have singing too. In French we have Madame Arnau, she is beautifully dressed, black lace. Hella has a lovely pen and pencil case; it's quite soft, we must have it soft so that it shan't make a row when it falls down during lesson time. I think it cost 7 crowns or 1.70 crowns, I don't know exactly. To-day lessons went on until 12, first German, then arithmetic, then religion for Catholics, and then we came away. Hella waited for me, for the Herr Pastor did not come.

September 24th. We thought the book shops would be open to-day but we were wrong. Hella's mother said, that's what happens when the chicks think themselves wiser than the hens. In the afternoon Hella came to our house and Inspee had been invited by the Fs. I don't go there, for it's so dull, they play the piano all day. I have enough piano at my lessons. My music lessons will begin when the school time-table has been fixed up. Perhaps on October 1st, then I must write to Frau B., she told me to write myself. She tells all her pupils to do that. I would rather have had Hella's music mistress. But she has no time to spare and I think she charges more. At least she wouldn't always be holding me up "Fraulein Dora" as a model. We are not all so musical as Fraulein Dora. In the evening Inspee was reading a great fat book until 10 or 12 o clock and she simply howled over it. She said she had not, but I heard her and she could hardly speak. She says she had a cold, liar.

September 25th. To-day they gave us the professors' time-table, but it won't work until the professors from the Gymnasium know exactly when they can come. Our Frau Doktor might be teaching in a Gymnasium, but since there is only one here she teaches in our school. To-morrow we are going to have a viva voce composition: Our Holidays. We may write 8 or 10 sentences at home before we come, but we must not look at what we have written in class. I've written mine already. But I've not said anything about Robert. He's not worth thinking about anyhow. I did not even tell Hella everything.

September 25th. We had the viva voce composition and Frau Doktor said, very good, what is your name? Grete Lainer I said and she said: And is that your chum next you? Now she must tell us how she spent her holidays. Hella did hers very well too and Frau Doktor said again, very good. Then the bell rang. In the long interval Frau Doktor played dodge

with us. It was great fun. I was it six times. In the little intervals we were quite alone for the staff has such a lot to do drawing up the time-table. A pupil-teacher from the F. high school is in our class. She sits on the last bench for she is very tall. As tall as Frau Doktor.

September 26th. To-day we had Professor Riegel for the first time in natural history. He wears eye-glasses and never looks any of us in the face. And in French Madame A. said that my accent was the best. We've got an awful lot on and I don't know whether I shall be able to write every day. The younger girls say Professor Igel instead of Riegel and the Weinmann girl said Nikel.

September 30th. I've had simply no time to write. Hella hasn't written anything since the 24th. But I must write to-day for I met Robert in Schottengasse. Good morning, Miss, you needn't be so stuck up, he said as he went by. And when I turned round he had already passed, or I would have given him a piece of my mind. I must go to supper.

October 1st. I can't write, Oswald has come from S., he has sprained his ankle, but I'm not so sure because he can get about. He is awfully pale and doesn't say a word about the pain.

October 4th. To-day is a holiday, the emperor's birthday. Yesterday Resi told me something horrid. Oswald can't go back to S. He has been up to something, I wish I knew what, perhaps something in the closet. He always stays there such a long time, I noticed that when I was in the country. Or perhaps it may have been something in his society. Inspee pretends she knows what it is but of course it isn't true, for she doesn't know any more than I do. Father is furious and Mother's eyes are all red with crying. At dinner nobody says a word. If I could only find out what he's done. Father was shouting at him yesterday and both Dora and I heard what he said: You young scamp (then there was something we couldn't understand) and then he said, you attend to your school books and leave the girls and the married women alone you pitiful scoundrel. And Dora said. Ah, now I understand and I said: Please tell me, he is my brother as well as yours. But she said: "You wouldn't understand. It's not suitable for such young ears." Fancy that, it's suitable for her ears, but not mine though she's not quite three years older than I am, but because she no longer wears a short skirt she gives herself the airs of a grown-up *lady*. Such airs, and then she sneaks a great spoonful of jam so that her mouth is stuffed with it and she

can’t speak. Whenever I see her do this, I make a point of speaking to her so that she has to answer. She does get in such a wax.

October 9th. I know all about it now. . . That’s how babies come. And *that* is what Robert really meant. Not for me, thank you, I simply won’t marry. For if one marries one has to do it; it hurts frightfully and yet one has to. What a good thing that I know it in time. But I wish I knew exactly how, Hella says she doesn’t know exactly herself. But perhaps her cousin who knows everything about it will tell her. It lasts nine months till the baby comes and then a lot of women die. It’s horrible. Hella has known it for a long time but she didn’t like to tell me. A girl told her last summer in the country. She wanted to talk about it to Lizzi her sister, really she only wanted to ask if it was all true and Lizzi ran off to her mother to tell her what Hella had said And her mother said; “These children are awful, a corrupt generation, don’t you dare to repeat it to any other girl, to Grete Lainer, for instance,” and she gave her a box on the ear. As if she could help it! That is why she didn’t write to me for such a long time. Poor thing, poor thing, but now she can tell me all about it and we won’t betray one another. And that deceitful cat Inspee has known all about it for ages and has never told me. But I don’t understand why that time at the swing Robert said: You little fool, you wont get a baby simply from that. Perhaps Hella knows. When I go to the gymnastic lesson to-morrow I shall talk to her first and ask her about it. My goodness how curious I am to know.

October 10th. I’m in a great funk, I missed my gymnastic lesson yesterday. I was upstairs at Hella’s and without meaning it I was so late I did not dare to go. And Hella said I had better stay with her that we would say that our sum was so difficult that we had not got it finished in time. Luckily we really had a sum to do. But I said nothing about it at home, for to-morrow Oswald is going to G. to Herr S’s. I thought that I knew all about it but only now has Hella really told me everything. It’s a horrible business this . . . I really can’t write it. She says that of course Inspee has it already, had it when I wrote that Inspee wouldn’t bathe, did not want to bathe; really she had it. Whatever happens one must always be anxious about it. *Streams of blood* says Hella. But then everything gets all bl . . . That’s why in the country Inspee always switched off the light before she was quite undressed, so that I couldn’t see. Ugh! Catch me looking! It begins at 14 and goes on for 20 years or more. Hella says that Berta Franke in our class knows all about it. In the arithmetic lesson she wrote a note:

Do you know what being un . . . is? Hella wrote back, of course I've known it for a long time. Berta waited for her after class when the Catholics were having their religion lesson and they went home together. I remember quite well that I was very angry, for they're not chums. On Tuesday Berta came with us, for Hella had sent her a note in class saying that I knew *everything* and she needn't bother about me. Inspee suspects something, she's always spying about and sneering, perhaps she thinks that she's the only person who ought to know anything.

October 16th. To-morrow is Father's and Dora's birthday. Every year it annoys me that Dora should have her birthday on the same day as Father; What annoys me most of all is that she is so cocky about it, for, as Father always says, it's a mere chance. Besides, I don't think he really likes it. Everyone wants to have their own birthday on their own day, not to share it with someone else. And it's always nasty to be stuck up about a thing like that. Besides, it's not going to be a real birthday because of the row about Oswald. Father is still furious and had to stay away from the office for 2 days because he had to go to G. to see about Oswald going there.

October 17th. It was much jollier to-day than I had expected. All the Bruckners came, so of course there was not much said about Oswald only that he has sprained his ankle, (I know quite well now that that's not true) and that he is probably going to G. Colonel B. said: The best thing for a boy is to send him to a military academy, that keeps him in order. In the evening Oswald said: That was awful rot what Hella's father said, for you can be expelled from a military academy just as easily as from the Gymnasium. That's what happened to Edgar Groller. Oswald gave himself away and Dora promptly said: Ah, so you have been expelled, and we believed you had sprained your ankle. Then he got in an awful wax and said: O you wretched flappers, I've gone and blabbed it all now, and he went away slamming the door, for Mother wasn't there.

October 19th. If we could only find out what Oswald really did. It must have been something with a girl. But we can't think what Father meant about a married woman. Perhaps a married woman complained of him to the head master or to the school committee and that's how it all came out. I feel awfully sorry for him, for I think how I should have felt myself if everything had come out about Robert and me. Of course I don't care now. But in the summer it would have been awful. Oswald hardly says a word, except that he has talks with Mother sometimes. He always pretends that

he wants to read, but it's absurd, for with such a love trouble one can't really read. I have not told Berta Franke all about it, but only that my brother has had an unhappy love affair and that is why he is back in Vienna. Then she told us that this summer a cousin of hers shot himself because of her. They said in the newspapers that it was because of an actress, but really it was because of her. She is 14 already.

October 20th. We spend most of our time now with Berta Franke. She says she has had a tremendous lot of experience, but she can't tell us yet because we are not intimate enough. By and by she says. Perhaps she is afraid we shall give her away. She wants to marry when she is 16 at latest. That's in 2 years. Of course she won't have finished school by then, but she will have left the third class. She has three admirers, but she has not yet made up her mind which to choose. Hella says I mustn't believe all this, that the story about the three admirers at once is certainly a cram.

October 21st. Berta Franke says that when one is dark under the eyes one has it and that when one gets a baby then one doesn't have it any more until one gets another. She told us too how one gets it, but I didn't really believe what she said, for I thought she did not know herself exactly. Then she got very cross and said: "All right, I won't tell you any more. If I don't know myself." But I can't believe what she said about husband and wife. She said it must happen every night, for if not they don't have a baby; if they miss a single night they don't have a baby. That's why they have their beds so close together. People call them *marriage beds!!!* And it hurts so frightfully that one can hardly bear it. But one has to for a husband can make his wife do it. I should like to know how he can make her. But I didn't dare to ask for I was afraid she would think I was making fun of her. Men have it too, but very seldom. We see a lot of Berta Franke now, she is an awfully nice girl, perhaps Mother will let me invite her here next Sunday.

October 23rd. Father took Oswald away to-day. Mother cried such a lot. When Oswald was leaving I whispered to him: I know what's the matter with you. But he did not understand me for he said: Silly duffer. Perhaps he only said that because of Father who was looking on with a fearful scowl.

October 27th. Everything seems to have gone wrong. Yesterday I got unsatisfactory in history, and in arithmetic to-day I couldn't get a single sum right. I'm frightfully worried about missing that gymnastic lesson. It

will be all right if Mother gives me the money to-morrow, for if she goes herself she will certainly find out about it.

October 28th. To-day the head mistress was present at our French lesson and said awfully nice things about me. She said I was good enough in French to be in the Third and then she asked me whether I was as good in the other subjects. I didn't want to say either Yes or No, and all the other girls said Yes, she's good at everything. The head patted me on the shoulder and said: I'm glad to hear that. When she had gone I cried like anything and Madame Arnau asked: Why, what's the matter? and the other girls said: In arithmetic she had Unsatisfactory but she can really do her sums awfully well. Then Madame said: "You'll soon wipe off that Unsatisfactory."

October 30th. To-day I had a frightful bother with Fraulein Vischer in the history lesson. Yesterday when I got into the tram with Mother there was Fraulein V. I looked the other way so that Mother shouldn't see her and so that she should not tell Mother about me. When she came in to-day she said: Lainer, do you know the rules? I knew directly what she meant and said "I did bow to you in the tram but you didn't see me." "That's a fine thing to do, first you do wrong and then try to excuse yourself by telling a lie. Sit down!" I felt awful for all the girls looked at me. In the 11 interval Berta Franke said to me: Don't worry, she's got her knife into you and will always find something to complain of. She must have spoken to Frau Doktor M., for in the German lesson the subject for viva voce composition was Good Manners. And all the girls looked at me again. She didn't say anything more. She's a perfect angel, my darling E. M., her name is Elisabeth; but she does not keep her name-day because she's a Protestant; that's an awful shame because November 19th is coming soon.

October 31st. I've been so lucky. Nothing's come out about the gymnastic lesson though Mother was there herself. And in mental arithmetic to-day I got a One. Fraulein Steiner is awfully nice too and she said: Why, L. what was the matter with you in your sums the other day, for you're so good at arithmetic? I didn't know what to do so I said: Oh I had such a headache the other day. Then Berta Franke nearly burst out laughing, it was horrid of her; I don't think she's quite to be trusted; I think she's rather a sneak. When the lesson was over she said she had laughed because "headache" means something quite different.

November 1st. To-day we began to work at the tablecloth for Father's Christmas present. Of course Inspee bagged the right side because that's easier to work at and I had to take the left side and then one has the whole caboodle on one's hand. For Mother I'm making an embroidered leather book cover, embroidered with silk and with a painted design; I can do the painting part at school in Fraulein H.'s lesson, she's awfully nice too. But I like Frau Doktor M. best of all. I'm *not* going to invite Berta Franke because of the way she laughed yesterday, and besides Mother doesn't like having strange girls to the house. November 2nd. I don't know all about things yet. Hella knows a lot more. We said we were going to go over our natural history lesson together and we went in to the drawing-room, and there she told me a lot more. Then Mali, our new servant, came in, and she told us something horrid. Resi is in a hospital because she's ill. Mali told us that all the Jews when they are quite little have to go through a very dangerous operation; it hurts frightfully and that's why they are so cruel. It's done so that they can have more children; but only little boys, not little girls. It's horrid, and I should not like to marry a Jew. Then we asked Mali whether it is true that it hurts so frightfully and she laughed and said: It can't be so bad as all that, for if it were you wouldn't find everyone doing it. Then Hella asked her: But have you done it already, you haven't got a husband? She said: Go on, Miss! One mustn't ask such questions it's not ladylike. We were in an awful funk, and begged her not to tell Mother. She promised not to.

November 5th. Everything has come out through that stupid waist band. Yesterday when I was tidying my drawers Mali came in to make the beds and saw my fringed waistband. "I say, she said, that is pretty!" You can have it if you like, I said, for I've given up wearing it. At dinner yesterday I noticed that Mother was looking at Mali and I blushed all over. After dinner Mother said, Gretel, did you give Mali that waistband? Yes, I said, she asked me for it. She came in at that moment to clear away and said: "No, I never asked for it, Fraulein Grete gave it to me herself." I don't know what happened after that, I'd gone back to my room when Mother came in and said: A fine lot of satisfaction one gets out of one's children. Mali has told me the sort of things you and Hella talk about. I ran straight off to the kitchen and said to Mali: How could you tell such tales of us? It was you who chipped in when we were talking. It was frightfully mean of you. In the evening *she* must needs go and complain of me to Father and

he scolded me like anything and said: You're a fine lot, you children, I must say. You are not to see so much of Hella now, do you understand?

November 6th. A fine thing this, that I'm a silly fool now. When I gave Hella a nudge so that she should not go on talking before Mali, she laughed and said: What does it matter, Mali knows all about it, probably a great deal more than we do. It was only after that that Mali told us about the Jews. Now, if you please, I am a silly fool. All right, now that I know what I am, a silly fool. And that's what one's best friend calls one!

November 7th. Hella and I are very stand-offish. We walk together, but we only talk of everyday things, school and lessons, nothing else. We went skating to-day for the first time and we shall go whenever we have time, which is not very often. Mother is working at the table cloth. It's very hard work but she has not got as much to do as we have.

November 8th. There was such a lovely young lady skating to-day, and she skates so beautifully, inside and outside edge and figures of 8. I skated along behind her. When she went to the cloak room there was such a lovely scent. I wonder if she is going to be married soon and whether *she* knows all about everything. She is so lovely and she pushes back the hair from her forehead so prettily. I wish I were as pretty as she is. But I am dark and she is fair. I wish I could find out her name and where she lives. I must go skating again to-morrow; do my lessons in the evening.

November 9th. I'm so upset; *she* didn't come to skate. I'm afraid she may be ill.

November 10th. She didn't come to-day either. I waited two hours, but it was no good.

November 11th. She came to-day, at last! Oh how pretty she is.

November 12th. She has spoken to me. I was standing near the entrance gate and suddenly I heard some one laughing behind me and I knew directly: That is *she!* So it was. She came up and said: Shall we skate together? Please, if I may, said I, and we went off together crossing arms. My heart was beating furiously, and I wanted to say something, but couldn't think of anything sensible to say. When we came back to the entrance a gentleman stood there and took off his hat and she bowed, and she said to me: Till next time. I said quickly: When? Tomorrow? Perhaps, she called back. . . . Only perhaps, perhaps, oh I wish it were to-morrow already.

November 13th. Inspee declares that her name is Anastasia Klastoschek. I'm sure it can't be true that she has such a name, she might be called Eugenie or Seraphine or Laura, but Anastasia, impossible. Why are there such horrid names? Fancy if she is really called that. Klastoschek, too, a Czech name, and she is supposed to come from Moravia and to be 26 already; 26, absurd, she's 18 at most. I'm sure she's not so much as 18. Dora says she lives in Phorusgasse, and that she doesn't think her particularly pretty. Of course that's rank jealousy; Dora thinks no one pretty except herself.

November 14th. I asked the woman at the pay box, her name really is Anastasia Klastoschek and she lives in the Phorusgasse; but the woman didn't know how old she is. She would not tell me at first but asked why I wanted to know and who had sent me to enquire. She wouldn't look into the book until I told her that it was *only for myself* that I wanted to know. Then she looked, for I knew the number of the cloak room locker: 36, a lovely number, I like it so much. I don't really know why, but when I hear anyone say that number it sounds to me like a squirrel jumping about in the wood.

November 20th. It's really impossible to write every day. Mother is ill in bed and the doctor comes every day, but I don't really know what's the matter with her. I'm not sure whether the doctor knows exactly. When Mother is ill everything at home is so uncomfortable and she always says: Whatever you do don't get ill, for it's such a nuisance. But I don't mind being ill; indeed I rather like being ill, for then everyone's so nice, when Father comes home he comes and sits by my bed and even *Dora* is rather nice and does things for me; that is she *has* to. Besides, when she had diptheria two years ago I did everything I could for her, she nearly died, her temperature went up to 107 and Mother was sick with crying. Father never cries. It must look funny when a man cries. When there was all that row about Oswald he cried, I think Father had given him a box on the ear. He said he hadn't but I think he had; certainly he cried, though he said he didn't. After all, why shouldn't he for he's not really grown up yet. I cry myself when I get frightfully annoyed. Still I shouldn't cry for a box on the ear.

November 21st. In the religion lesson to-day Lisel Schrotter who is the Herr Catechist's favourite, no we've got to call him Herr Professor, as she is the Herr Professor's favourite, well she went to him with the Bible and

asked him what *with child* meant. That's what they say of Mary in the Bible. The Schrotter girl does not know anything yet and the other girls egged her on till she went and asked. The Herr Professor got quite red and said: If you don't know yet it does not matter. We shall come to that later, we're still in the Old Testament. I was so glad that Hella does not sit next me in the religion lesson, because she's a Protestant; we should certainly have both burst out laughing. Some of the girls giggled frightfully and the Herr Professor said to Lisel: You're a good girl, don't bother about the others. But Lisel positively howled. I would not have asked, even if I hadn't really known. *With child* is a stupid word anyhow, it doesn't mean anything really; only if one knows.

November 22nd. When I was coming away from the religion lesson with Berta Franke the other day, of course we began talking about *it*. She says that's why people marry, only because of *it*. I said I could not believe that people marry only for *that*. Lots of people marry and then have no children. That's all right said Berta, but it's quite true what I tell you. Then she told me a lot more but I really can't write it all down. It is too horrid, but I shan't forget. When I was sitting on Mother's bed to-day I suddenly realised that Father's bed is really quite close to Mother's. I had never thought about it before. But it's not really necessary now for we are all quite big. Still I suppose they've just left things as they were. Well dear, said Mother, what are you looking round so for? Of course I didn't let on, but said: I was only looking round and thinking that if your bed was where the washstand is you could see to read better when you are lying in bed. That would not do because the wall's all wrong said Mother. I said nothing more and she didn't either. I like much better to sleep on a sofa than in a bed, because I like to snuggle up against the back. I'm so glad Mother didn't notice anything. One has to be so frightfully careful not to give oneself away when one knows everything.

November 25th. I have just been reading a lovely story; it is called *A True Heart* and is about a girl whose betrothed has had to leave her because he has shot a man who was spying on him. But Rosa remains true to him till he comes back after 10 years and then they marry. It's simply splendid and frightfully sad at first. I do love these library books, but when we were at the elementary school I knew all the books they had and the mistress never knew what to give me and Hella. In the high school we get only one book a month, for the Frau Doktor says we have plenty of work to

do, and that when we are not at work we ought to be out in the fresh air. I can't manage to go skating every day. I do love the Gold Fairy, that is my name for *her*, for I hate her real name. Inspee declares that they call her Stasi for short, but I don't believe that; most likely they call her Anna, but that's so common. Thank goodness Hella always calls me Rita, so at school I'm known as Rita. It's only at home that they will call me Gretl. The other day I said to Inspee: If you want me to call you Thea you must call me Rita; and anyhow I won't let you call me Gretl, that's what they call a little girl or a peasant girl. She said: I don't care tuppence what *you* call me. All right, then, she shall be Dora till the end of time.

November 27th. Father has been made Appeal Court Judge. He is awfully glad and so is Mother. The news came yesterday evening. Now he can become President of the Supreme Court, not directly, but in a few years. We shall probably move to a larger house in May. Inspee said to Mother that she hoped she would have her *own* room where she would not be *disturbed*. How absurd, who disturbs her, I suppose I do? Much more like she disturbs me, always watching while I'm writing my diary. Hella always says: "There really ought not to be any elder sisters;" she's jolly well right. It's a pity we can't alter things. Mother says we are really too big to keep St. Nicholas, but I don't see why one should ever be too big for that. Last year Inspee got something from St. Nicholas when she was 13 and I'm not 12 yet. All we get are chocolates and sweets and dates and that sort of thing, not proper presents. The girls want to give the Frau Doktor a great Krampus * to leave it on her desk. I think that's silly. It's not a proper present for a teacher one is really fond of, one doesn't want to waste sweets on a teacher one doesn't like, and to give an empty Krampus would be rude. Mother is really right and a Krampus is only suitable for children.

* Krampus=Ruprechtsknecht, i.e. a little Demon, who serves St. Nicholas, and is a bogey man to carry off naughty children An image of this Demon filled with sweets, is given as a present on the feast of St. Nicholas which inaugurates the Christmas season. — Translators' Note.

December 1st. We are giving everyone of the staff a Krampus, each of us is to subscribe a crown, I hope Father will give me the crown extra. Perhaps he'll give us more pocket money now, at least another crown, that would be splendid. We are going to give big Krampuses to the ones we like

best, and: small ones to those we are not so fond of. We're afraid to give one to Professor J. But if he doesn't get one perhaps he'll be offended.

December 2nd. To-day we went to buy Krampuses for the staff. The one for Frau Doktor M. is the finest. When you open it the first thing you see is little books with Schiller, Goethe, and Fairy Tales written on the backs, and then underneath these are the sweets. That's exactly suited for her, for the Frau Doktor teaches German and in the Fourth in German they are reading these poets. Last month in the Fourth they had a Schiller festival and Frau Doktor made a splendid speech and some of the girls gave recitations. Besides Hella has shown me an awful poem by Schiller. There you can read: if only I could catch her in the bath, she would cry for mercy, for I would soon show the girl that I am a man. And then in another place: "To my mate in God's likeness I can show *that* which is the source of life." But you can only find that in the *large* editions of Schiller. I believe we've got some books of that sort in our bookcase, for when Inspee was rummaging there the other day Mother called from the next room: "Dora, what are you hunting for in the bookcase? I can tell you where it is." And she said: Oh, it's nothing, I was just looking for something, and shut the door quickly.

December 4th. The girls are so tiresome and have made such a muddle about the Krampuses for the staff. The money didn't come out right and Keller said that Markus had taken some but Markus said not taken only kept. Of course Markus complained to Frau Doktor and her father went to the head and complained too. Frau Doktor said we know quite well that collections are not allowed and that we must not give any one a Krampus. Now Keller has the five Krampuses and we don't know what to do about it. Mother says that sort of thing never turns out well but always ends in a quarrel.

December 5th. We are in such a funk: Hella and I and Edith Bergler have taken the Krampus which we bought for Frau Doktor M. and put it on her doorstep. Edith Bergler knew where she lived for she comes by there every day on her way to school. I wonder if she'll guess where the Krampus comes from. I did not know that Edith Bergler was such a nice girl, I always thought she must be deceitful because she wears spectacles. But now I'm quite certain she is not deceitful, so one sees how easy it is to make a mistake. To-morrow's our German lesson.

December 6th. Frau Doktor did not say anything at first. Then she gave out the subject for the essay: “Why once I could not go to sleep at night.” The girls were all taken aback, and then Frau Doktor said: Now girls that’s not so very difficult. One person cannot go to sleep because he’s just going to be ill, another because he is excited by joy or fear. Another has an uneasy conscience because he has done something which he has been forbidden to do; have not all of you experienced something of the kind? Then she looked frightfully hard at Edith Bergler and us two. She did not say anything more, so we don’t really know if she suspects. I couldn’t go to the ice carnival yesterday because I had such a bad cough, and Dora couldn’t go either because she had a headache; I don’t know whether it was a real headache or *that kind* of headache; but I expect it was that kind.

December 17th. I haven’t managed to write anything for a whole week. The day before yesterday we had our Christmas reports: In history I had satisfactory, in Natural History good, in everything else very good. In diligence because of that stupid Vischer I had only a 2. Father was very angry; he says everyone can get a 1 in diligence. That’s true enough, but if one has satisfactory in anything then one can’t get a 1 for diligence. Inspee of course had only 1’s, except a 2 in English. But then she’s a frightful swot. Verbenowitsch is the best in our class, but we can’t any of us bear her, she’s so frantically conceited and Berta Franke says she’s *not to be trusted*. Berta walks to school with her cousin who’s in the seventh; she’s nearly 14, and is awfully pretty. She didn’t say what sort of a report she had, but I believe it was a very bad one.

December 18th. To-day at supper Dora fainted because she found a little chicken in her egg, not really a chicken yet, but one could make out the wings and the head, just a sketch of a chicken Father said. Still, I really can’t see what there was to faint about. Afterwards she said it had made her feel quite creepy. And she’ll never be able to eat another egg. At first Father was quite frightened and so was Mother, but then he laughed and said: What a fuss about nothing! She had to go and lie down at once and I stayed downstairs for a long time. When I came up to our room she was reading, that is I saw the light through the crack in the door; but when I opened the door it was all dark and when I asked: Ah so you’re still reading she didn’t answer and she pretended to wake up when I switched on the light and said: What’s the matter? I can’t stand such humbug so I said: Shut up, you know quite well it’s 9 o-clock. That’s all. On our way to

school to-day we didn't Speak a word to one another. Luckily after awhile we met a girl belonging to her class.

December 19th. I'm frightfully excited to know what I'm going to get for Christmas. What I've wished for is: A set of white furs, boa, muff, and velvet cap trimmed with the same fur, acme skates because mine are always working loose, *German* sagas, not Greek; no thank you, hair ribbons, openwork stockings, and if possible a gold pin like the one Hella got for a birthday present. But Father says that our Christ Child would find that rather too expensive. Inspee wants a corset. But I don't think she'll get one because it's unhealthy. The tablecloth for Father is finished and is being trimmed, but Mother's book cover is not quite ready yet. I'm giving Dora a little manicure case. Oh, and I'd nearly forgotten what I want more than anything else, a lock-up box in which to keep my diary. Dora wants some openwork stockings too and three books. A frightful thing happened to me the other day. I left one of the pages of my diary lying about or lost one somehow or other. When I came home Inspee said: "you've lost *this*, haven't you? School notes I suppose?" I didn't notice what it was for a moment, but then I saw by the look of it and said: Yes, those are school notes. Hm-m-m, said Inspee, not exactly that are they? You can thank your stars that I've not shown them to Mother. Besides people who can't spell yet really ought not to keep diaries. It's not suitable for children. I was in a wax. In the closet I took a squint to see what mistakes I had made. There was only *wenn* with one *n* instead of double *n* and *dass* with short *ss's*, that's all. I was jolly glad that there was nothing about *her* on the page. She'd underlined the *n* and the short *ss's* with red, just as if she was a schoolmistress, infernal cheek! The best would be to have a book with a lock to it, which one could alway keep locked, then no one could read any of it and underline one's mistakes in red. I often write so fast that it's easy to make a slip now and again. As if she never made a mistake. The whole thing made me furious. But I can't say anything about it because of Mother, at least on the way to school; but no, if I say nothing at all then she always gets more waxy than ever. If I were to say much about it Mother might remember those 5 pages I lost in the country and I'd rather not thank you.

December 22nd. Aunt Dora came to-day. She's going to stay with us for a time till Mother is quite well again. I didn't remember her at all, for I was only four or five when she went away from Vienna. You dear little

black beetle she said to me and gave me a kiss. I didn't like the *black* much, but Hella says that suits me, that it's *piquant*. *Piquant* is what the officers always say of her cousin in Krems, Father says she is a beauty, and she's dark like me. But I'd rather be fair, fair with brown eyes or better still with violet eyes. Shall I grow up a beauty? Oh I do hope I shall!

December 23rd. I am frightfully excited about to-morrow. I wonder what I shall get? Now I must go and decorate the Christmas tree. Inspee said: Hullo, is *Gretl* going to help decorate this year? She's never done it before! I should like to know why not. But Aunt Dora took my side. "Of course she'll help decorate too; but please don't stuff yourselves with sweets." "If Dora doesn't eat anything I shan't either," said I promptly.

Evening. Yesterday was our last day at school. The holidays are from the 23rd to January 2nd. It's glorious. I shall be able to go skating every day. Of course I had no time to-day and shan't have to — morrow. I wonder whether I should send the Gold Fairy a Christmas card. I wish she had a prettier name. Anastasia Klastoschek; it is so ugly. All Czech names are so ugly. Father knows a Count Wilczek, but a still worse name is Schafgotsch. Nothing would induce me to marry anyone called Schafgotsch or Wilczek even if he were a count and a millionaire. Yesterday we paid our respects to the staff, Verbenowitsch and I went to Frau Doktor because she is fondest of us, or is *said* to be. Nobody wanted to go to Professor Rigl, Igel, we always say Nikel, for when he has respects paid to him he always says: "Aw ri'." But it would have been rude to leave him out and so the monitors had to go. When Christmas was drawing near Frau Doktor told us that we were none of us to give presents to the staff. "I beg you, girls, to bear in mind what I am saying, for if you do not there will only be trouble. You remember what happened on St. Nicholas' day. And you must not send anything to the homes of the staff, nor must the Christ Child leave anything on any one's doorstep." As she said this she looked hard at me and Edith Bergler, so she knows who left the Krampus. I'm so tired I can't keep my eyes open. Hurrah, to-morrow is Christmas Eve!!!

December 24th. Christmas Eve afternoon is horrid. One does not know what to be at. I'm not allowed to go skating so the best thing is to write. Oswald came home yesterday. Everyone says he's looking splendid; I think he's awfully pale and he snorted when everyone said he had such a fine colour; of course, how can he look well when he has such a *heartache*.

I wish I could tell him that I understand what he feels, but he's too proud to accept sympathy from me. He has wished for an army revolver for Christmas, but I don't think he'll get one for boys at the middle school are not allowed to have any firearms. Not long ago at a Gymnasium in Galicia one of the boys shot a master out of revenge; they said it was because the boy was getting on badly with his work, but really it was about a girl, although the master was 36 years old. This morg. I was in town with Oswald shopping; we met the Warths, Elli and . . . Robert. Oswald said that Elli was quite nice-looking but that Robert was an ugly beast. Besides, he can't stand him he said, because he glared at me so. If only he knew what happened in the summer! I was awfully condescending to Robert and that made him furious. If one could only save you girls from all the troubles which the world calls "Love," said Oswald on the way home. I was just going to say "I know that you're unhappy in love and I can feel for you," when Inspee came round the corner of the Bognergasse with her chum and 2 officers were following them, so none of them saw us. "Great Scott, Frieda's full-fledged now," said Oswald, "she's a little tart." I can't stand that sort of vulgarity so I did not say another word all the way home. He noticed and said to Mother: "Gretl's mouth has been frozen up from envy." That's all. But it was really disgusting of him and now I know what line to take.

Just a moment for a word or two. The whole Christmas Eve has gone to pot. A commissionaire came with a bouquet for Dora and Father is fuming. I wish I knew who sent it. I wonder if it was one of those 2 officers? Of course Inspee says she has not the ghost of an idea. What surprises me is that Oswald has not given her away. All he said was: I say, what a lark! But Father was down on him like anything, "You hold your jaw and think of your own beastly conduct." I didn't envy him; I don't think much of Dora's looks myself, but apparently she pleases *someone*. In the bouquet there was a poem and Dora got hold of it quickly before Father had seen it. It was awfully pretty, and it was signed: One for whom you have made Christmas beautiful! The heading is: "The Magic Season." I think Dora's splendid not to give herself away; even to me she declares she does not know who sent it; but of course that may be all humbug. I think it really comes from young Perathoner, with whom she's always skating.

December 28th. I've had absolutely no time to write. I got everything I wanted. Aunt Dora gave both of us an opera glass in mother-of-pearl in a plush case. We are going to all the school performances, Father's arranged it; he has subscribed to *all* the performances during the school year 19 — to 19 — . I am so delighted for Frau Doktor M. will come too. I do hope I shall sit next to her.

December 31st. To-day I wanted to read through all I have written, but I could not manage it but in the new year I really must write every day.

January 1st, 19 — . I must write a few sentences at least. For the afternoon we had been invited to the Rydberg's the Warths were there and Edle von Wernhoff!! I was just the same as usual with Lisel but I would not say a word to R. They left before us, and then Heddy asked me what was wrong between me and R. He had said of me: Any one can have the *black goose for me*. Then he said that any one could take me in. I was so stupid that I would believe anything. I can't think what he meant, for he never took me in about anything. Anyhow I would not let *him* spoil new year's day for me. But Hella is quite right for if the first person one meets on January 1st is a common person that's a bad beginning. The first thing this morning when I went out I met our old postman who's always so grumpy if he's kept waiting at the door. I looked the other way directly and across the street a fine young gentleman was passing, but it was no good for the common postman had really been the first.

January 12th. I am so angry. *We* mayn't go skating any more because Inspee has begun to complain again of her silly old ears and Mother imagines that she got her earache last year skating. It's all right to keep *her* at home; but why shouldn't *I* go? How can *I* help it when *she* gets a chill so easily? In most things Father is justice itself, but I really can't understand him this time. It's simply absurd, only it's too miserable to call it absurd. I'm in a perfect fury. Still, I don't say anything.

February 12th. I have not written for a whole month, I've been working so hard. To-day we got our reports. Although I've been working so frightfully hard, again I only got a 2 in Diligence. Frau Doktor M. made a splendid speech and said: As you sow, so you shall reap. But that's not always true. In Natural History I did not know my lesson twice but I got a 1, and in History I only did not know my lesson once and I got Satisfactory. Anyhow Fraulein V. does not like me because of that time when I did not bow to her in the tram. That is why in January, when

Mother asked about me, she said: “She does not really put her back into her work.” I overheard Father say: After all she’s only a kid, but to-day he made a frightful row about the 2 in Diligence. He might have known why she gave me that. Dora, *so she says*, has only ones, but she has not shown me the report. I don’t believe what I don’t see. And Mother never gives her away to me.

February 15th. Father is furious because Oswald has an Unsatisfactory in Greek. Greek is really no use; for no one uses Greek, except the people who live in Greece and Oswald will never go there, if he is going to be a judge like Father. *Of course* Dora learns Latin; but not for me thank you. Hella’s report is not particularly good and her father was in a *perfect fury!!!* He says she ought to have a better report than any one else. She does not bother much and says: One can’t have everything. But if she doesn’t get nothing but ones in the summer term she is not to stay at the high school and will have to go to the middle school. That’ll make her sit up. Father’s awfully funny too: What have you got history books for, if you don’t read them? Yesterday when I was reading my album of stories, Father came in and said: You like a story book better than a history book, and shut the book up and took it away from me. I was in such a temper that I went to bed at 7 o’clock without any supper.

February 20th. I met the Gold Fairy to-day. She spoke to me and asked why I did not come skating any more. The fancy dress Ice Carnival on the 24th was splendid she said. I said: Would you believe it, a year ago my *sister* had an earache, and *for that reason* they won’t allow *either* of us to skate this year. She laughed like anything and said so exquisitely: Oh, what a wicked sister. She looked perfectly ravishing: A red-brown coat and skirt trimmed with fur, sable I believe, and a huge brown beaver hat with crepe-de-chine ribbons, lovely. And her eyes and mouth. I believe she will marry the man who is always going about with her. Next autumn, when we get new winter clothes, I shall have a fur trimmed red-brown. We must not always be dressed alike. Hella and Lizzi are never dressed alike.

March 8th. I shall never say another word to Berta Franker she’s utterly false. I’ve such a frightful headache because I cried all through the lesson. She wrote to Hella and me in the arithmetic lesson: A *Verhaltnis* * * means something quite different. Just at that moment the mistress looked across and said: To whom were you nodding? She said: To Lainer. Because she laughed at the word “Verhaltnis.” It was not true. I had not thought about

the word at all. It wasn't till I had read the note that it occurred to Hella and me what *Verhaltnis* means. After the lesson Fraulein St. called us down into the teachers' room and told Frau Doktor M. that Franke and I had laughed at the use of the word "Verhaltnis." Frau Doktor said: What was there to laugh at? Why did you not just do your sums? Fraulein St. said: You ought to be ashamed of yourselves, young girls in the first class shouldn't know anything about such things. I shall have to speak to your mothers. In the German lesson Frau Doktor M. told us to write an essay on the proverb: Pure the heart and true the word, clear the brow and free the eye, these are our safeguards, or something of that sort; I must get Hella to write it for me, for I was crying all through the lesson.

* * The German word Verhaltnis as used in the arithmetic lesson

means ratio, proportion. The word is in common use in Germany for a love intimacy or liaison. — Translators' Note.

March 10th. To-day Berta Franke wanted to talk things out with us; but Hella and I told her we would not speak to her again. We told her to remember *what sort* of things she had said to us. She denied it all already. We shouldn't be such humbugs. It was mean of her. Really we didn't know anything and *she* told us all about it. Hella has told me again and again she wished we didn't know anything. She says she's always afraid of giving herself away and that she often thinks about that sort of thing when she ought to be learning her lessons. So do I. And one often dreams about such things at night when one has been talking about them in the afternoon. Still, it's better to know all about it.

March 22nd. I so seldom manage to write anything, first of all our lessons take such a lot of time, and second because I don't care about it any more since what Father said the other day. The last time I wrote was on Saturday afternoon, and Father came in and said: Come along children, we'll go to Schonbrunn. That will do you more good than scribbling diaries which you only go and lose when you've written them. So Mother told Father all about it in the holidays. I couldn't have believed it of Mother for I begged her to promise not to tell anyone. And she said: One doesn't promise about a thing like that; but I won't tell anyone. And now she must have told about it, although she said she wouldn't. Even Franke's deceitfulness was nothing to that for after all we've only known her since

last autumn, but I could never have believed that Mother would do such a thing. I told Hella when we were having tea at the Tivoli and she said she would not altogether trust her mother, she'd rather trust her father. But if that had happened to *her*, her father would have boxed her ears with the diary. I did not want to show anything, but in the evening I only gave Mother quite a little kiss. And she said, what's the matter, dear? has anything happened? Then I could not keep it in and I cried like anything and said: You've betrayed me. And Mother said: "I?" Yes, you; you told Father about the diary though you promised me you wouldn't. At first Mother didn't remember anything about it, but soon she remembered and said: "But, little one, I tell Father everything. All you meant was that Dora was not to know." That's quite true, it's all right that Dora wasn't told; but still Father need not have been told either. And Mother was awfully sweet and nice and I didn't go to bed till 10 o'clock. But whatever happens I shan't tell her anything again and I don't care about the old diary any more. Hella says: Don't be stupid; I ought just to go on writing; but another time I should be careful not to lose anything, and besides I should not blab everything to Mother and Father. She says she no longer tells her mother anything since that time in the summer when her mother gave her a box on the ear because that other girl had told her all about everything. It's quite true, Hella is right, I'm just a child still in the way I run to Mother and tell her everything. And it's not nice of Father to tease me about my diary; I suppose he never kept one himself.

March 27th. Hurrah we're going to Hainfeld for Easter; I am so delighted. Mother has a friend there whose husband is doctor there, so she has to live there all the year round. Last year in the winter she and Ada stayed three days with us because her eyes were bad. Ada is really nearly as old as Dora, but Dora said, like her cheek: "Her intellectual level makes her much more suitable company for you than for me." Dora thinks herself cleverer than anyone else. They have 2 boys, but I don't know them very well for they are only 8 and 9. Mother's friend was in an asylum once, for she went off her head when her 2 year old baby died. I remember it quite well. It must have been more than 2 years ago when Father and Mother were always talking of poor Anna who had lost her child within 3 days. And I believed she had really lost it, and once I asked whether they had found it yet. I thought it had been lost in the forest, because there's such a

great forest at Hainfeld. And since then I can't bear to hear people say lost when they mean dead, for it is so difficult to know which they really mean.

On the 8th of April the Easter holidays will begin and we shall go on the 11th, on Maundy Thursday.

April 6th. I don't know what to do about writing my diary. I don't want to take it with me and as for remembering everything and writing it down afterwards I know quite well I should never do that. Hella says I should only jot it down in outline, that's what Frau Doktor M. always says, and write it out properly after I come back from Hainfeld. That's what she does. They are going to the Brioni Islands. I've never seen the sea. Hella says there's nothing so wonderful about it. She's been there four times. Anyway she does not think so much of it as most people do. So it can't be anything so frightfully grand. Rather stupid I dare say.

April 12th. We got here yesterday. Ada is a darling but the two boys are awfully vulgar. Ernstl said to Ada: I shall give you a smack on the a —— if you don't give me my pistol directly. Ada is as tall as her mother. Their speech is rather countrified Even the doctor's. He drinks a frightful lot of beer; quarts I believe.

April 14th. Father came to-day. He's awfully fond of the doctor. They kissed one another. It did make me laugh. In the morning we were in the forest; but there are no violets yet, only a few snowdrops, but a tremendous lot of hellebores quite red.

April 15th. We got up at 4 yesterday morning. We did not go into the church for Mother was afraid that the smell of incense and boots would make Dora feel bad. What rot! It was lovely. This afternoon we are going to Ramsau, it's lovely there.

April 16th. Father went home to-day. We go home to-morrow. At Whitsuntide Ada's mother is going to bring her to be confirmed. They are all coming to stay with us. I got stuck in a bog on the bank of the Ramsau. It was awful. But the doctor pulled me out and then we did all laugh so when we saw what my shoes and stockings were like. Luckily I was able to catch hold of a tree stump or I should have sunk right in.

April 18th. Hella says it was splendid at the Brioni Islands. She is frightfully sunburned. I don't like that, so I shall *never* go to the *south*. Hella says that if one marries in winter one *must* spend one's honeymoon in the south. That would not suit me, I should just put off my marriage till the summer.

Ada is only 13 not 14 like Dora, and the parish priest makes a tremendous fuss because she's not confirmed yet. Her mother is going to bring her to be confirmed soon. We are not going to be confirmed because Father and Mother don't want to be bothered with it. Still I should like to be confirmed, for then one *has* to have a watch, and one can ask for something else at Christmas.

April 21st. Our lessons are something frightful just now. The school inspector is coming soon. It's always very disagreeable. Mme A. says: The inspection is for the staff not for the pupils. Still, it's horrid for the pupils too first of all because we get blamed at the time and secondly because the staff makes such a frightful row about it afterwards. Dora says that a bad inspection can make one's report 2 degrees worse. By the way, that reminds me that I have not yet written why Oswald did not come home at Easter. *Although his reports were not at all good*, he was allowed to go to Aunt Alma's at Pola, because this year Richard comes home for the holidays for the last time. After that he's going away for three years in the steamship "Ozean" to the East or Turkey or Persia, I don't quite know where. If Oswald likes he can go into the Navy too in two years.

May 9th. The school inspector came to-day, first of all in natural history, thank goodness I wasn't in for it that time, and then in German; I was in that, reading and in the table of contents of the Wandering Bells. Thank goodness I got through all right.

May 14th. It's Mother's birthday to-day. We've had simply no time to work anything for her, so we got a wonderful electric lamp for her bed table, the switch is a bunch of grapes and the stand is made of brass. She was so pleased with it. Yesterday Frau v. R. was here. She's a friend of Mother's and of Hella's mother. I should like to have music lessons from Frau v. R., she gives lessons since her husband who was a major died though she is quite well off.

May 15th. That must have been true about the inspection; in the interval to-day Professor Igel-Nikel said to the Herr Religionsprofessor: Well, he will go on coming all through the week and then we shall be all right for this year. *We*, of course that means the staff. But really the staff can't help it if the pupils are no good. Though Oswald says it's all the fault of the staff. I shall be glad too when the inspection is over. The staff is always quite different when the inspector is there, some are better, some are stricter, and Mme. A. says: I always feel quite ill with anxiety.

May 29th. At Whitsuntide Frau Doctor Haslinger came from Hainfeld with Ada and the two boys for the confirmation. On Whitsunday the doctor came too and in the evening they all went home again. Ada is very pretty, but she looks countrified. I'm not going to be confirmed anyhow. We had to wait 3 hours, though the Friday before Whitsunday was a very fine day. Dora did not come; only Mother and I and Ada and her mother. The women who were selling white favours all thought that I was one of the candidates because I wore a white dress too. Ada was rather put out about it. On Saturday we were in town in the morning and afternoon because Ada liked that better than the Kahlenberg; on Sunday morning we went to Schonbrunn and in the afternoon they went home. The watch they gave to Ada was a lovely one and Dora and I gave her a gold chain for a locket. She enjoyed herself immensely, except that on Sunday she had a frightful headache. Because she is not used to town noises.

May 31st. Ada knows a good deal already, but not everything. I told her a few things. In H. last winter a girl drowned herself because she was going to have a baby. It made a great sensation and her mother told her a little, but not everything. Ada once saw a bitch having her pups, but she didn't tell her mother about it; she thought that her mother might be very angry. Still, she could not help it, the dog belonged to their next door neighbour and she happened to see it in the out-house. Ada is expecting *it* to begin every day for she is nearly 14. In H. every grown-up girl has an admirer. Ada says she will have one as soon as she is 14; she knows who it will be.

June 3rd. Ada wrote to-day to thank Mother about the confirmation and she wrote to me as well. It is strange that she did not make friends with Dora but with me. I think that Dora won't talk about *those* things, at least only with her friends in the high school, especially with Frieda Ertl. That is why Ada made friends with me, though I am 2 years younger. She is really an awfully nice girl.

June 19th. One thing after another goes missing in our class, first it was Fleischer's galoshes, then my new gloves, three times money was missing, and today Fraulein Steiner's new vanity bag. There was a great enquiry. But nothing was found out. We all think it is Schmolka. But no one will tell. To-day we could none of us attend to our lessons especially when Sch. left the room at half past 11.

June 20th. In our closet the school servant found some beads on the floor but since she did not know anything she threw them into the dustbin. Was it really Sch.? It would be a dirty trick. Frl. St. is frightfully upset because her betrothed gave her the vanity bag for a birthday present and his photo was in it. But I'm really sorry for Sch. Nobody will speak to her although nothing is proved yet. She is frightfully pale and her eyes are always full of tears. Hella thinks too that perhaps she didn't do it, for she is one of Frl. St.'s favourites and she is very fond of her herself. She always carries the copybooks home for her.

June 22nd. Our closet was stopped up and when the porter came to see what was the matter he found the vanity bag. But what use is it to Frl. now; she can't possibly use it any more. We giggled all through lessons whenever we caught one another's eye and the staff was in a frightful rage. Only Frau Doktor M. said: "Now please get through with your laughing over this extremely unsavoury affair, and then have done with it."

June 23rd. There was a frightful row to-day. Verbenowitsch was collecting the German copybooks and when Sch. wanted to hand up her copybook she said: Please give up your copybook yourself; I won't have anything to do with (then there was a long pause) you. We were all apalled and Sch. went as white as a sheet. At 10 o'clock she begged permission to leave the room because she felt bad. I'm sure her mother will come to speak about it to-morrow.

June 24th. Sch.'s mother did not come after all. Verbenowitsch said: Of course not! Sch. did not come either. Hella says she couldn't stand anything like that, she would rather drown herself. I don't know, one wants *other* reasons for drowning oneself. Still, I should tell Father so that he could speak about it at school. Franke said: Yes, that's all very well, because *you* didn't do it; but *if* one had done it one would not dare to say anything at home. Besides, Sch.'s father is an invalid, he's quite paralysed, has been bedridden for two years and can't speak.

June 27th. To-day Hella and I walked home with Frau Doktor M. Really she always goes home alone but Hella suddenly left me and went up to Frau Doktor in the street and said: Please excuse me Frau Doktor for bothering you in the street, we *must* speak to you. She got quite red. Then Frau Doktor said: "What's the matter?" And Hella said: "Isn't it possible to find out who took the vanity bag? If it wasn't Sch. the way the other girls treat her will make her quite ill, and if it was we can't stand having

her among us any longer." Hella was really splendid and Frau Doktor M. made us tell her everything that had happened, including about Verbenowitsch and the copybooks; and we saw quite clearly she had tears in her eyes and she said: "The poor child! Children I promise I will do what I can for her." We both kissed her hand and my heart beat furiously. And Hella said: "You are an angel." I could never have managed to say a thing like that.

June 28th. To-day Sch. was there again, but Frau Doktor M. did not say anything. Hella and I kept on looking at her and Hella cleared her throat three times and Frau Doktor said: Bruckner, do stop clearing your throat; it will only make your sore throat worse: But it seemed to me her eyes twinkled as she said it. So she hasn't forgotten. I wanted to speak to Sch., but Hella said: Wait a bit, we must give the Frau Doktor a chance. She's taken the matter in hand. To-morrow before 9 we'll walk up and down in front of her house till she comes out.

June 30th. Unluckily yesterday was a holiday and to-day Frau Doktor's first lesson began at 11. But she has already had a talk with Sch. only we don't know when and where; certainly it was not in the interval and she did not send for Sch. during lessons.

July 1st. To-day we walked to school with her She *is* such a dear. Children, she said, this is such a painful matter, and it is difficult to find a way out. Sch. insists that she did not do it, and whether she did it or not these days are burning themselves into her soul and Hella asked: "Please, Frau Doktor advise us what to do, speak to her or not?" Then she said: Children I think that after this affair she won't come back to us next year; you will be doing a good work if you make these last days bearable to her. You were never intimate with her, but to give her a friendly word or two will do you no harm and may help her. You 2 have a high standing in the class; your example will do good. We walked with her till we reached the school, and because we were there we could not kiss her hand but Hella said out loud: How sweet you are! She must have heard it. But Sch. was not at school. Father says he's glad that the term is nearly over, for I have been quite crazy about this affair. Still, he thinks that Hella and I should talk to Sch. So does Mother. But Dora said: Yes that's all right but you must not go too far.

July 5th. Sch. was not at school to-day. To-morrow we are to get our reports.

July 6th. We cried like anything I and Hella and Verbenowitsch because we shan't see Frau Doktor M. any more for nearly 3 months. I only had 2 in History and Natural History, but 1 in everything else. Franke says: Anyone who is not in Professor Igel-Nigl's good books can find out that he's cranky and stupid and *he* could never get a one. Father is quite pleased. Of course Dora has got only ones and Hella has three twos. Lizzi, I think, has 3 or 4. Father has given each of us a 2 crown piece, we can blow it, he says and Mother has given us a lace collar.

July 9th. We are going to Hainfeld this summer, its jolly, I'm awfully pleased; but not until the 20th because Father can't get away till then and Mother won't leave Father so long alone. It is only a few days anyhow. It's a pity Hella's gone already, she left early this morning for Parsch near Salzburg, what a horrid name and Hella too doesn't like saying it; I can't think how anyone can give a place such a nasty name. They have rented a house.

July 12th. It's shockingly dull. Nearly every day I have a quarrel with Dora because she's so conceited Oswald came home yesterday. He's fearfully smart nearly as tall as Father only about a quarter head shorter, but then Father's tremendously tall. And his voice is quite deep, it was not before. And he has parted his hair on one side, it suits him very well. He says his moustache is growing already but it isn't; one could see it if it were; five hairs don't make a moustache.

July 19th. Thank goodness we're going at last the day after to-morrow. Father wanted Mother to go away with us earlier, but she would not. It would have been nicer if she had.

July 24th. Our house is only 3 doors away from the Hs. Ada and I spend the whole day together. There happens to be a schoolfellow of Dora's here, one she gets on with quite well, Rosa Tilofsky Oswald says that Hainfeld bores him to death and that he shall get a friend to invite him somewhere. Nothing will induce him to spend the whole holidays here. His name for Ada is: "Country Simplicity." If he only knew how much she knows. Rosa T. he calls a "Pimple Complex" because she has two or three pimples. Oswald has some fault to find with every girl he comes across. He says of Dora: She is a green frog, for she always looks so pale and has cold hands, and he says of me: You can't say anything about her yet: "*She* is still nothing but an unripe embryo." Thank goodness I know from the natural history lessons what an embryo is, a little frog; "I got in a frightful wax

and Father said: Don’t you worry, he’s still a long way from being a man or he would be more polite to his sisters and their lady friends.” This annoyed him frightfully, and since then he never says a word when Ada and Rosa are with us. My birthday is coming soon, thank goodness I shall be 12 then, only 2 years more and I shall be 14; I am so glad. Hella wrote to me to-day for the second time. In August she is going to Hungary to stay with her uncle, he has a great estate and she will learn to ride there.

SECOND YEAR, AGE TWELVE TO THIRTEEN

SECOND YEAR

August 1st. It was awfully jolly on my birthday. We drove to Glashutte where it is lovely; there we cooked our own dinner in the inn for the landlady was ill and so was the cook. On one's birthday everyone is always so nice to one. What I like most of all is the Ebeseder paint-box, and the book too. But I never have any time to read. Hella sent me a lovely picture: Maternal Happiness, a dachshund with two puppies, simply sweet. When I go home I shall hang it up near the door over the bookcase. Ada gave me a silk purse which she had worked for me herself. Aunt Dora gave me a diary, but I can't use it because I prefer to write upon loose sheets. Grandfather and Grandmother at B. sent me a great piece of marzipan, splendid. Ada thinks it lovely; she didn't know marzipan before.

August 9th. When it's not holidays Ada goes to school in St. Polten staying there with her aunt and uncle, because the school in H. is not so good as the school in St. P. Perhaps next term she is coming to Vienna, for she has finished with the middle school and has to go on learning. But she has no near relations in Vienna where she could stay. She might come to live with us, Dora could have a room to herself as she always wants, and Ada and I could share a room. I would much rather share a room with her than with Dora who is always making such a fuss.

August 10th. I do really think! A boy can always get what he wants. Oswald is really going for a fortnight to Znaim to stay with his chum; only Oswald of course. I should like to see what would happen if Dora or I wanted to go anywhere. A boy has a fine time. It's the injustice of the thing which makes me furious. For we know for certain that he's had a *bad* report, even though he does not tell us anything about it. But of course that doesn't matter. They throw every 2 in our teeth and when he gets several Satisfactories he can go wherever he likes. His chum too; he only got to know Max Rozny this year and he's a chum already. Hella and I have been chums since we were in the second in the elementary school and Dora and Frieda Ertl since they went to the High School. We both gave him a piece of our mind about friendship. He laughed scornfully and said: That's all right, the friendships of *men* become closer as the years pass, but the friendships of you girls go up in smoke as soon as the first admirer turns

up. What cheek. Whatever happens Hella and I shall stick to one another till we're married, for we want to be married on the same day. Naturally she will probably get engaged before me but she *must* wait for me before she's married. That's simply her duty as a friend.

August 12th. Oswald went away yesterday and we had another scene just before he left because he wanted one of us to go with him to the station and help carry his luggage. As if we were his servants. Ada wanted to volunteer to carry it, but Dora gave her a nudge and luckily she understood directly. Sometimes, but only sometimes, when Dora gets in a wax she is rather like Hella. She thinks it's better that Oswald has gone away because otherwise there are always rows. That's because she always comes off second-best. For really he is cleverer than she is. And when he wants to make her really angry he says something to her in Latin which she can't understand. I think that's the real reason why she's learning Latin. I must say I would not bother myself so about a thing like that. I really wouldn't bother.

August 15th. To-day I posted the parcel to Hella, a silver-wire watchchain; I made it in four days. I hope she'll get it safely, one can never be sure in Hungary.

August 17th. We are so frightfully busy with Japanese lanterns and fir garlands. The people who have received birthday honours are illuminating and decorating their houses. While we were at work Ada told me a *few things*. She knows more than Hella and me, because her father is a doctor. He tells her mother a good deal and Ada overhears a lot of things though they generally stop talking when she comes in. Ada would like awfully to be an actress. I never thought of such a thing though I've been to the theatre often.

August 22nd. Hella is awfully pleased with the chain; she is wearing it. She is really learning to ride at her cousin's. It's a pity he's called Lajos. But Ludwig is not any better. He seems to be awfully nice and smart, but it's a pity he's 22 already.

August 25th. Ada is frightfully keen on the theatre. She has often been to the theatre in St. Polten and she is in love with an actor with whom all the ladies in St. Polten are in love. That is why she wants to be an actress and so that she can live *free and unfettered*. That is why she would like so much to come to Vienna. I wish she could come and live with us. She says she is pining away in H. for it's a dull hole. She says she can't stand these

cramping conditions. In St. Polten she spent all her pocket money upon flowers for *him.* She always said that she had to buy such a lot of copybooks and things for school. That's where she's lucky not to be at home, for I could not easily take in Mother like that. It would not work. One always has too little pocket money anyhow, and when one lives at home one's parents know just what copybooks one has. I should like to go away from home for a few months. Ada says it is very good for one, for then one learns to know the world; at home, she says, one only grows *musty* and *fusty*. When she talks like that she really looks like an actress and she certainly has talent; her German master at school says so too. She can recite long poems and the girls are always asking the master to let her recite.

August 30th. To-day Ada recited Geibel's poem, The Death of Tiberius, it was splendid; she is a born actress and it's a horrid shame she can't go on the stage; she is to teach French or sewing. But she says she's going on the stage; I expect she will get her way somehow.

August 31st. Oswald's having a fine long fortnight; he's still there and can stay till September 4th!! If it had been Dora or me. There would have been a frightful hulabaloo. But Oswald may do *anything*. Ada says: We girls must take for ourselves what the world won't give us of its own free will.

September 5th. In the forest the other day I promised Ada to ask Mother to let her come and stay with us so that she could be trained for the stage. I asked Mother to-day, but she said it was quite out of the question. Ada's parents simply could not afford it. If she has talent, the thing comes of itself and she need only go to a school of Dramatic Art so that she could more easily get a good Theatre says Ada. So I don't see why it should be so frightfully expensive. I'm awfully sorry for Ada.

September 10th. Oh we have all been so excited. I've got to pack up my diary because we're going home to-morrow. I must write as quickly as I can. There have been some gypsies here for three days, and yesterday one of the women came into the garden through the back gate and looked at our hands and told our fortunes, mine and Ada's and Dora's. Of course we don't believe it, but she told Ada that she would have a great but short career after many difficult struggles. That fits in perfectly. But she made a frightful mess of it with me: Great happiness awaits me when I am *as old again as I am now*; a great passion and great wealth. Of course that must

mean that I am to marry at 24. At 24! How absurd! Dora says that I look much younger than 12 so that she meant 20 or even 18. But that's just as silly, for Dr. H., who is a doctor and knows so many girls, says I look *older* than my age. So that it's impossible that the old gypsy woman could have thought I was only 10 or even 9. Dora's fortune was that in a *few* years she was to have much trouble and then happiness. And she told Ada that her line of life was broken!!

September 14th. Oswald left early this morning, Father kissed him on both cheeks and said: For God's sake be a good chap this last year at school. He has to matriculate this year, it's frightfully difficult. But he says that anyone who has cheek enough can get through all right. He says that cheek is often more help than a lot of swoting and grinding. I know he's right; but unfortunately at the moment it never occurs to me what I ought to do. I often think afterwards, you ought to have said this or that. Hella is really wonderful; and Franke too, though she's not particularly clever, can always make a smart answer. If only half of what Oswald says he says to the professors is true, then I can't understand why he is not expelled from every Gym. says Mother. Oswald says: If one only puts it in the right way no one can say anything. But that doesn't hold always.

September 16th. Hella is coming back to-day. That's why I'm writing in the morning, because she's coming here in the afternoon. I'm awfully glad. I have begged Mother to buy a lovely cake, one of the kind Hella and I are both so fond of.

September 20th. Only a word or two. School began again to-day. Thank goodness Frau Doktor M. still takes our class. Frl. Steiner took her doctor's degree at the end of the school year. In history we have a new Frau Doktor, but we don't know her name yet. The Vischer woman has been *married* in the holidays!!! It's enough to make one split with laughing that anyone should marry *her!!!* Dora says she wouldn't like to be her husband; but most likely he will soon get a divorce. Besides, spectacles in a woman are awful. I can put up with a pincenez for one does not wear them all the time. But spectacles! Dora says too that she can't understand how a man can marry a woman with spectacles. Hella often says it makes her feel quite sick when Vischer glares at her through her spectacles. We have a new natural history professor. I'm awfully glad that three of our mistresses have doctors degrees and that we have one or really 2 professors, for we have the Religionsprofessor too. In the Third they are

frightfully annoyed because only one of their mistresses has a doctor's degree. Dora has 2 doctors and three professors.

September 25th. All the girls are madly in love with Professor Wilke the natural history professor. Hella and I walked behind him to-day all the way home. He is a splendid looking man, so tall that his head nearly touches the lamp when he stands up quickly, and a splendid fair beard like fire when the sun shines on it; a Sun God! we call him S. G., but no one knows what it means and who we are talking about.

September 29th. Schmolka has left, I suppose because of Frl. St.'s vanity bag. Two other girls have left and three new one's have come, but neither I nor Hella like them.

October 1st. It was my turn in Natural History to-day I worked frightfully hard and *He* was splendid. We are to look after the pictures and the animals *all through the term.* How jolly. Hella and I always wear the same coloured hair ribbons and in the Nat. Hist. lesson we always put tissue paper of the same colour on the desk. He wants us to keep notebooks, observations on Nature. We have bound ours in lilac paper, exactly the same shade as his necktie. On Tuesdays and Fridays we have to come to school at half past 8 to get things ready. Oh how happy I am.

October 9th. *He* is a cousin of our gymnastic master, splendid! This is how we found it out. We, Hella and I, are always going past the Cafe Sick because he always has his afternoon coffee there. And on Thursday when we passed by there before the gymnastic lesson there was the gymnastic master sitting with him. Of course we bowed to them as we passed and in the gymnastic lesson Herr Baar said to us: So you two are tormented and pestered by my cousin in natural history? "Pestered" we said, o no, it's the most delightful lesson in the whole week. "Is that so?" said he, "I won't forget to let him know." Of course we begged and prayed him not to give us away, saying it would be awful. But we do hope he will.

October 20th. Frau Doktor Steiner's mother is dead. We are so sorry for her. Some of us are going to the funeral, I mayn't go, Mother says it is not suitable, and Hella is not allowed to go either, I wonder if *He* will go? I'm sure he will, for really he *has* to.

October 23rd. Frau Doktor St. looks frightfully pale. Franke says she will certainly get married soon now that both her parents are dead. Her fiance often fetches her from the Lyz, I mean he waits for her in L. Street. Hella thinks an awful lot of him of course, because he's an officer. I don't

think much of him myself, he's too short and too fat. He's only a very little taller than Frl. St. I think a husband should be nearly a head taller than his wife, or at least half a head taller, like our Father and Mother.

October 29th. We have such a frightful lot of work to do that we're not taking season tickets this winter, but are going to pay each time when we go skating. I wish we knew whether *He* skates, and where. Hella thinks that with great caution we might find out from his cousin during the gymnastic lesson. They are often together in the Cafe. I should like to know what they talk about, they are always laughing such a lot, especially when we go by.

October 31st. Ada has written to me. She is *awfully* unhappy. She is back in St. P., in a continuation school. But the actor is not there any more. She writes that she yearns to throw off her chains which lie heavy on her soul. Poor darling. No one can help her. That is, her Mother could help her but she won't. It must be awful. Hella thinks that her parents will not allow her to go on the stage until she has tried to do herself a mischief; then things may be better. It's quite true, what can her mother be thinking of when she knows how fearfully unhappy Ada is. After all, why on earth shouldn't she go on the stage when she has so much talent? All her mistresses and masters at the middle school praised her reciting tremendously and one of them said in so many words that she had *great dramatic talent*. Masters don't flatter one; except . . .; first of all *He* is not just an ordinary master but a professor, and secondly *He* is quite, quite different from all others When he strokes his beard I become quite hot and cold with extasy. And the way he lifts up his coat tails as he sits down. It's lovely, I do want to kiss him. Hella and I take turns to put our penholder on his desk so that *he* can hallow it with his hand as he writes. Afterwards in the arithmetic lesson when I write with it, I keep looking at Hella and she looks back at me and we both know what the other is thinking of.

November 15th. It's a holiday to-day so at last I can write once more. We have such a frightful lot to do that I simply can't manage to write. Besides Mother is often ill. She has been laid up again for the last 4 days. It's awfully dull and dreary. Of course I had time to write those days, but then I didn't want to write. As soon as Mother is well again she's going to the Lyz to ask how we are getting on I'm awfully glad because of S.G.

November 28th. Mother came to school to-day and saw him too. I took her to him and he was heavenly. He said: I am very pleased with your

daughter; she's very keen and clever. Then he turned over the pages of his notebook as if to look at his notes. But really he knows by heart how we all work. That is not *all* of course. That would be impossible with so many girls; and he teaches in the science school as well where there are even more boys than we are.

December 5th. Skating to-day I saw the Gold Fairy. She is awfully pretty, but I really don't think her so lovely as I did last year. Hella says she never could think what had happened to my eyes. "You were madly in love with her and you never noticed that she has a typical Bohemian nose," said Hella. Of course that's not true, but now my taste is *quite different*. Still, I said how d'you do to her and she was very nice. When she speaks she is really charming, and I do love her gold stoppings. Frau Doktor M. has two too and when she laughs its heavenly.

December 8th. I do wish Dora would keep her silly jokes to herself. When the Trobisch's were all here to-day they were talking about the school and she said: "Gretl has a fresh enthusiasm each year; last year it was Frau Doktor Malburg and this year it's Professor Wilke. Frau Doktor Malburg has fallen from grace now." If I had wanted to I could have begun about the two students on the ice. But I'm not like that so I merely looked at her with contempt and gave her a kick under the table. And she had the cheek to say: "What's the matter? Oh, of course these tender secrets of the heart must not be disclosed. Never mind Gretl, it does not matter at your age, for things don't cut deep." But she was rightly paid out: Frau von Tr. and Father roared with laughter and Frau v. Tr. said: "Why, grandmother, have you been looking at your white hair in the glass?" Oh, how I did laugh, and she was so frightfully put out that she blushed like fire, and in the evening *she* said to *me* that I was an ill-mannered pig. That's why I did not tell her that she'd left her composition book on the table and to-morrow she has to give it in. It's all the same to *me*, for I'm an ill-mannered pig.

December 9th. It's awful. At 2 o'clock this afternoon Hella was taken to the Low sanatorium and was operated on at once. Appendicitis. Her mother has just telephoned that the operation has been successful. But the doctors said that 2 hours later it would have been too late. My knees are trembling and my hand shakes as I write. She has not slept off the anisthetic yet.

December 10th. Hella is frightfully weak; no one can see her except her father and mother, not even Lizzi. On St. Nicholas Day we had such a jolly time and ate such a lot of sweets that we almost made ourselves sick. But its impossible that she got appendicitis from that. On Monday evening, when we were going home after the gym lesson, she said she did not feel at all well. The night before last she had a rigor and the first thing in the morning the doctor said that she must go to hospital at once for an operation.

December 11th. All the girls at school are frightfully excited about Hella, and Frau Dr. St. was awfully nice and put off mathematics till next Tuesday. On Sunday I am going to see Hella. She does want to see me so and so do I want to see her.

December 12th. She is still very weak and doesn't care about anything; I got her mother to take some roses and violets from me, she did like them so much.

December 14th. This afternoon I was with Hella from two until a quarter to 4. She is so pale and when I came in we both cried such a lot. I brought her some more flowers and I told her directly that when he sees me Prof. W. always asks after her. So do the other members of the staff especially Frau Doktor M. The girls want to visit her but her mother won't let them. When anyone is lying in bed they look quite different, like strangers. I said so to Hella, and she said: We can never be strangers to one another, not even in death. Then I burst out crying again and both our mothers said I must go away because it was too exciting for Hella.

December 15th. I was with Hella again to-day. She passed me a little note asking me to get from her locker the parcel with the blotting-book for her father and the key basket for her mother and bring it to her because the things are not ready yet for Christmas.

December 16th. Hella's better to-day. I've got to paint the blotting-book for her father. Thank goodness I can. She'll be able to finish the key basket herself, that's nothing.

December 18th. The Bruckners are all frightfully unhappy for it won't be a real Christmas if Hella has to stay in hospital over Christmas. But perhaps she will for since yesterday she has not been so well, the doctors can't make out why she suddenly had fever once more. For she didn't let on that I had brought her some burnt almonds because she's so awfully

fond of them. But now I'm so terribly frightened that she'll have to have another operation.

December 19th. Directly after school I went to see Hella again for I had been so anxious I could not sleep all night. Thank goodness she's better. One of the doctors said that if she'd been in a private house he would have felt sure it was an error in diet, but since she was in hospital that could be excluded. So it was from the burnt almonds and the two sticks of marzipan. Hella thinks it was the marzipan, for they were large ones at 20 hellers each because nuts lie heavy on the stomach. She had a pain already while I was still there, but she wouldn't say anything about it because it was her fault that I'd brought her the sweets. She can beg as much as she likes now, I shan't bring her anything but flowers, and they can't make her ill. Of course it would be different if it were true about the "Vengeance of Flowers." But that's all nonsense, and besides I don't bring any strong-scented flowers.

December 20th. I am so glad, to-morrow or Tuesday Hella can come home, in time for the Christmas tree. Now I know what to give her, a long chair, Father will let me, for I have not enough money myself but Father will give me as much as I want. Oh there's no one like Father! To-morrow he's going to take me to the Wahringerstrasse to buy one.

December 21st. I was only a very short time with Hella to-day because Father came to fetch me soon. At first she was a little hurt, but then she saw that we had important business so she said: All right as long as it is not anything made of marzipan. That nearly gave us both away. For when we were in the street Father asked me: Why did Hella say that about marzipan? So I said quickly: Since she's been ill she has a perfect loathing for sweets. Thank goodness Father didn't notice anything. But I do hate having to tell fibs to Father. First of all I always feel that he'll see through it, and secondly anyhow I don't like telling fibs to him. The couch is lovely, a Turkish pattern with long tassels on the round bolster. Father wanted to pay for it altogether, but I said: No, then it would not be my present, and so I paid five crowns and Father 37. To-morrow early it will be sent to the Bruckners.

December 22nd. Hella is going home to-morrow. She has already been up a little, but she is still so weak that she has to lean on someone when she walks. She is awfully glad she is going home, for she says in a hospital one always feels as if one was going to die. She's quite right. The first

time I went to see her I nearly burst out crying on the stairs. And afterwards we both really did cry frightfully. Her mother knows about the couch, but it has not been sent yet. I do hope they won't forget about it at the shop.

December 23rd. Hella went home to-day. Her father carried her upstairs while I held her hand. The two tenants in the mezzanin came out to congratulate her and the old privy councillor on the second story and his wife sent down a great pot of lilac. She was so tired that I came away at 5 o'clock so that she could rest. To-morrow I'm going to their Christmas tree first and then to ours. Because of Hella the Br's are going to have the present giving at 5 o'clock, we shall have ours as usual at 7.

December 26th. Yesterday and the day before I simply could not write a word. It was lovely here and at Hella's. I shan't write down all the things I got, because I've no time, and besides I know anyhow. Hella was awfully pleased with the couch, her father carried her into the room and laid her on the sofa. Her mother cried. It was touching. It's certainly awfully nice to have got through a bad illness, when everyone takes care of one, and when no one denies you the first place. I don't grudge it to Hella. She's such a darling. Yesterday I was there all day, and after dinner, when she had to go to sleep, she said: Open the drawer of my writing-table, the lowest one on the right, and you'll find my diary there if you want to read it. I shall never forget it! It's true that we agreed we would let one another read our diaries, but we've never done it yet; after all we're a little shy of one another, and besides after a long time one can't remember exactly what one has written. What she writes is always quite short, never more than half a page, but what she writes is always important. Of course she couldn't sleep but instead I had to read her a lot of things out of her diary, especially the holidays when she was in Hungary. She was made much of there. By two cadets and her two cousins. We laughed so madly over some things that it hurt Hella's wound and I had to stop reading.

December 29th. We were put in such a frightful rage yesterday. This is how it happened. It is a long time since we both gave up playing with dolls and things of that sort but when I was rummaging in Hella's box I came across the dolls' things; they were quite at the bottom where Hella never looked at them. I took out the little Paris model and she said: Give it here and bring all the things that belong to it. I arranged them all on her bed and we were trying all sorts of things. Then Mother and Dora came. When

they came in Dora gave such a spiteful look and said: Ah, at their favourite occupation: look, Lizzi, their cheeks are quite red with excitement over their play. Wasn't it impertinent. We playing with dolls! Even if we had been, what business was it of hers to make fun of us? Hella was in a frightful rage and to-day she said: "One is never safe from spies; please put all those things away in the box so that I shan't see them any more." It really is too stupid that one should always be reproached about dolls as if it was something disgraceful. After all, one doesn't really understand until later how all the things are made; when one is 7 or 8 or still more when one is quite a little girl and one first gets dolls, one does not understand whether they are pretty and nicely dressed or not. Still, to-day we've done with dolls for ever. A good day to turn over a new leaf, for the day after to-morrow is New Year's Day.

But what annoys me most of all was this piece of cheek of Dora's; she says that Lizzi said: "We used to delight in those things at one time," but I was in such a rage that I did not hear it. But to eat all the best things off the Christmas tree on the sly!!! I saw it myself, *that* is nothing. *That's* quite fit and proper for a girl of 15. After supper yesterday I asked: But what's become of the second marzipan sandwich, I'm sure there were two on the tree. And I looked at her steadily till she got quite red. And after a time I said: the big basket of vegetables is gone too. Then she said. Yes, I took it, I don't need to ask your permission. As for the sandwich, Oswald took that. I was in such a temper, and then Father said: Come, come, you little witch, cool your wrath with the second sandwich and wash it down with a sip of liqueur. For Grandfather sent Father a bottle of liqueur.

December 30th. This is a fine ending to the year. I've no interest in the school any longer. We're silly little fools, love-sick and forward minxes. That's all the thanks we get for having gone every Tuesday and Friday to the school at half past 8 to arrange everything and dust everything and then he can say a thing like that. I shall never write *he* with a big h again; he is not worthy of it. And I had to swallow it all, choke it down, for I simply must not excite Hella. It made me frightfully angry when Mother told me, but still I'm glad for I know what line to take now. Mother was paying a call yesterday and the sister of our gymnastic master, who is at the —— High School, happened to be there, and she told Mother that her cousin Dr. W. is so much annoyed because the girls in the high school are so forward. Such silly little fools, and the little minxes begin it already in

the First Class. *For that reason he prefers to teach* boys, they are fond of him too but they don't make themselves such an *infernal nuisance*. Well, now that I know *I* shant make myself a nuisance to him any more. On Friday, when the next lesson is, I shall go there 2 minutes before nine and take the things into the class-room without saying a word. And I shall tell Kalinsky too that we're such an *infernal nuisance* to him. Just fancy, as if *we* were in the First Class!

January 1st, 19 — . This business with Prof. W. makes me perfectly furious. Hella kept on asking yesterday what was the matter, said I seemed different somehow. But thank goodness I was able to keep it in. I must keep it in for the sake of her health, even if it makes me ill. Anyway what use is life now. Since people are so falsehearted. He always looked so awfully nice and charming; when I think of the way in which he asked how Hella was and all the time he was so false!!! If Hella only knew. Aha, to-morrow!

January 2nd. I treated him *abominably*. Knocked at the door — Good-morning, Herr Prof. please what do we want for the lesson to-day? He very civilly: Nothing particular to-day. Well, what sort of a Christmas did you have — I: Thank you, much as usual. — He turned round and stared at me: It does not seem to have been; to judge from your manner. — I: There are quite other reasons for that. He: O-o-h? He may well say O-o-h! For he has not the least idea that I know the way in which he speaks of us.

January 6th. To-day Hella was able to go out for her first drive. She's much better now and will come back to school by the middle of the month. I *must* tell her before that or she'll get a shock. Yesterday she asked: Does not S. C. ask about me any more? — Oh yes, I fibbed, but not so often as before. And she said: That's the way it goes, out of sight out of mind. What will happen when she learns the truth. Anyhow I shan't tell her until she's quite strong.

January 10th. I've had to tell Hella already. She was talking so enthusiastically about S. G. At first I said nothing. And then she said: What are you making such a face for? Are not you allowed to arrange the things any more? — I: *Allowed*? Of course I'm *allowed*, but I don't *want* to any more. I did not tell Hella *how* bad I feel about it; for I really *was* madly in love with him.

January 12th. Hella must have been madly in love with him too or rather must be in love with him still. On Sunday evening she was so much

upset that her mother believed she was going to have a relapse. She had pains and diarrea at the same time. Thank goodness she's got over it like me. She said to-day: Don't let's bother ourselves about it any more. We wasted our feelings (not love!!) on an unworthy object. At such moments she is magnificent, especially now when she is still so pale. Besides in the holidays and now since she has been ill she has grown tremendously. Before I was a little taller and now she is a quarter head taller than me. Dora is frightfully annoyed because I am nearly as tall as she is. Thank goodness it makes me look older than 12 1/2.

Hella is not to come to school on January 15th, for her mother is going to take her to Tyrol for 2 or 3 weeks.

January 18th. It's horridly dull with Hella away. Only now do I realise, since her illness. I am always feeling as if she had fallen ill again. Her mother has taken her to Meran, they are coming back in the beginning of February.

January 24th. Since Hella has been ill, that is really since, she went away, I spend most of my time with Fritzi Hubner. She's awfully nice, though I did not know it last year. Till Hella comes back she and I sit together. For it's horrid to sit alone on a bench Fritzi knows a good deal already. She would not talk about it at first because it so often leads to trouble. Her brother has told her everything. He's rather a swell and is called Paul.

January 29th. Yesterday was the ice carnival and Dora and I were allowed to go. I skated with Fritzi and Paul most of the time and won 2 prizes, one of them with Paul. And one of them skating in a race with 5 other girls. Paul is awfully clever, he says he's going into the army, the flying corps. That's even more select than being on the general staff. Her father is a major and he, I mean Paul, ought to have gone to the military academy, but his grandfather would not allow it. He is to choose for himself. But of course he will become an officer. Most boys want to be what their father is. But Oswald is perhaps going into the Navy. I wish I knew what Father meant once when he said to Mother: Good God, I'm not doing it on my own account. I'm only doing it because of Oswald. The two girls won't get much out of it.

February 3rd. I've just been reading what I wrote about Father. I am wondering what it can be. I think that Father either wants to win the great

prize in the lottery or is perhaps going to buy a house. But Dora and I would get something out of that, for it would not belong to Oswald only.

February 4th. Yesterday I asked Mother about it. But she said she didn't know; if it was anything which concerned us, Father would tell us. But it must be something, or Mother would not have told Father in the evening that I had asked. I can't endure these secrets. Why shouldn't we know that Father's going to buy a house. Fritzi's grandfather has a house in Brunn and another in Iglau. But Fritzi is very simply dressed and her mother too.

February 9th. Thank goodness Hella is coming back to-morrow, just before her birthday. Luckily she can eat everything again so I am giving her a huge bag of Viktor Schmid's sweets with a silver sugar tongs. Mother and I are going to meet Hella at the station. They are coming by the 8.20.

February 10th. I am so glad Hella is coming to-day. I nearly could not meet her because Mother is not very well to-day. But Father's going to take me. Fritzi wanted to come and see Hella to-morrow afternoon, but she can't. She's an awfully nice girl and her brother is too, but on the first day Hella is back we must be alone together. She said so too in the last letter she wrote me. She's been away more than 3 weeks. It's a frightfully long time when you are fond of one another.

February 15th. I simply can't write my diary because Hella and I spend all our free time together. Yesterday we got our reports. Of course Hella has not got one. Except in Geography and History I have nothing but Ones, even in Natural History although since New Year I have not done any work in that subject. I detest Natural History. When Hella comes back to school we are going to ask the *sometime* S. G. to relieve us from the labours of looking after the things. Hella is still too weak to do it. Hella is 13 already and Father says she is going to be wonderfully pretty. *Going to be*, Father says; but she's lovely already. She's been burned as brown as a berry by the warm southern sun, and it really suits *her*, though only her. I can't stand other people when they are sun-burned. But really everything suits Hella; when she was so pale in hospital, she was lovely; and now she is just as lovely, only in quite a different way. Oswald is quite right when he says: You can measure a girl's beauty by the degree in which she bears being sunburned without losing her good looks. He really used to say that in the holidays simply to annoy Dora and me, but he's quite right all the same.

February 20th. The second half-year began yesterday. They were all awfully nice to Hella, and Frau Doktor M. stroked her cheeks and put her arm round her so affectionately. Now for the chief thing. Today was the Natural History lesson. We knocked at the door and when we went in Prof. W. said: Ah I'm glad to see you Bruckner; take care that you don't give us all another fright. How are you? Hella said: "Quite well, thank you, Herr Prof." And as I looked at her she put on a frightfully serious face and he said: It seems to me that you've caught your friend's ill humour. — Hella: "Herr Prof., you are really too kind, but we don't want to trouble you. What things have we to take to the class-room? And then we beg leave to resign our posts, for I don't feel strong enough for the work." She said this in quite a soldierly way, the way she is used to hear her father speak. It sounded most distinguished. He looked at us and said: "All right, two of the other pupils will take it over." We don't know whether he really noticed nothing or simply did not wish to show that he had noticed. But as we shut the door I felt so awfully sorry; for it was the last time, the very last time.

February 27th. In Natural History to-day I got *Unsatisfactory*. I was not being questioned, but when Klaiber could not answer anything I laughed, and he said: Very well, Lainer, you correct her mistake. But since I had been thinking of something quite different I did not know what it was all about, and so I got an Unsatisfactory. *Before* of course that would not have mattered; but now since . . . Hella and Franke did all they could to console me and said: "That does not matter, it wasn't an examination; he'll *have* to examine you properly later." Anyhow Franke thinks that however hard I learn, I shall be well off if he gives me a Satisfactory. She says no professor can forget *such a defeat*. For we told her about the silly little fools. She said, indeed, that we had made it too obvious. That's not really true. But now she takes our side, for she sees that we were in the right. Verbenowitsch and Bennari bring in the things now. They are much better suited for it. Hella's father did not like her doing it anyhow; he says: The porter or the maidservant are there for that — we never see them all the year round, that's a fine thing.

March 8th. Easter does not come this year until April 16th. I am going with the Bruckners to Cilli, outside the town there they have a vineyard with a country house. Hella needs a change. I am awfully glad. All the flowers begin to come out there at the end of March or beginning of April.

March 12th. Hella is not straightforward. We met a gentleman to-day, very fashionably dressed with gold-rimmed eyeglasses and a fair moustache. Hella blushed furiously, and the gentleman took off his hat and said: Ah, Fraulein Helenchen, you are looking very well. How are you? He never looked at me, and when he had gone she said: “That was Dr. Fekete, who assisted at my operation.”— “And you tell me *that* now for the first time?” Then she put on an innocent air and said: “Of course, we’ve never met him before,” but I said: “I don’t mean *that*. If you knew how red you got you would not tell me a lie.” Then she said: “What am I telling you a lie about? Do you think I’m in love with him? Not in the very least.” — But when one is *not* in love one does not blush like that. Anyhow I shan’t tell everything now either; I can hold my tongue too.

March 14th. Yesterday we did not talk to one another so much as usual; I especially was very silent. When the bell rang at 5 and I had just been doing the translation Hella came and begged my pardon and brought me some lovely violets, so of course I forgave her. This is really the first time we’ve ever quarrelled. First she wanted to bring me some sweets, but then she decided upon violets, and I think that was much more graceful. One gives sweets to a little child when it has hurt itself or been in a temper. But flowers are not for a child.

March 19th. Frieda Belay is dead. We are all terribly upset. None of us were very intimate with her, but now that she is dead we all remember that she was a schoolfellow. She died of heart failure following rheumatic fever. We all attended her funeral, except Hella who was not allowed to come. Her mother cried like anything and her grandmother still more; her father cried too. We sent a wreath of white roses with a lovely inscription: Death has snatched you away in the flower of your youth — Your Schoolfellows.

I have no pleasure in anything to-day. I did not see Frieda Belay after she was dead, but Franke was there yesterday and saw her in her coffin. She says she will never forget it, it gave her such a pang. In the church Lampl had a fit of hysterics, for her mother was buried only a month ago and now she was reminded of it all and was frightfully upset. I cried a lot too when I was with Hella. She fancied it was because I was thinking she might have died last Dec. But that wasn’t it, I don’t think about that sort of thing. But when anyone dies it is so awfully sad.

March 24th. I never heard of such a thing. I can't go to Cilli with Hella. Her mother was at her cousin's, and when she heard that she was going to Cilli at Easter she asked her to take Melanie with her. That is, she didn't ask straight out, but kept on hinting until Hella's mother said: Let Melanie come with us, it will help to set her up after her illness. In the winter she had congestion of the lung. Hella and I can't bear her because she's always spying on us and is so utterly false. So of course I can't go. Hella says too she's frightfully sorry, but when *she* is about we could never say a word about anything, it would drive us crazy. She quite agrees that I had better not come. But oh I'm so annoyed for first of all I do so like going away with Hella and secondly I should like to go away in the holidays anyhow for nearly all the girls in our class are going away. Still, there's nothing to be done. Hella's mother says she can't see why we can't all 3 go though it simply would not work. But we can't explain it to her. Hella is so poetical and she says "A beautiful dream vanished."

In Hella's mouth such fine words sound magnificent, but when Dora uses such expressions they annoy me frightfully because they don't come from her heart.

March 26th. The school performances finish today with Waves of the Sea and Waves of Love. I'm awfully fond of the theatre, but I never write anything about that. For anyhow the play is written by a poet and one can read it if one wants to, and one just sees the rest anyhow. I can't make out what Dora finds such a lot to scribble about always the day after we've been to the theatre. I expect she's in love with one of the actors and that's why she writes such a lot. Besides we in the second class did not get tickets for all the performances, but only the girls from the Fourth upwards. Still, it did not matter much to me anyhow for we often go in the evening and on Sunday afternoons. But unfortunately I mayn't go in the evening as a rule.

March 29th. To-day something horrible happened to Dora and me. I simply can't write it down. She was awfully nice and said: Two years ago on the Metropolitan Railway the same thing had happened when she was travelling with Mother on February 15th, she can never forget the date, to Hietzing to see Frau v. Martini. Besides her and Mother there was only one gentleman in the carriage, Mother always travels second class. She and Mother were sitting together and the gentleman was standing farther down the carriage where Mother could not see him but Dora could. And as Dora

was looking he opened his cloak and —— — ! just what the man did to-day at the house door. And when they got out of the train Dora's boa got stuck in the door and she had to turn round though she did not want to, and then she saw again —— — ! She simply could not sleep for a whole month afterwards. I remember that time when she could not sleep but I did not know why it was. She never told anyone except Erika and the same thing happened to her once. Dora says that happens at least once to nearly every girl; and that such men are "*abnormal*." I don't really know what that means, but I did not like to ask. Perhaps Hella will know. Of course I did not really look, but Dora shivered and said: "And *that* is what one has to endure." And then, when we were talking it over she said to me that *that* was why Mother was ill and because she has had five children; Then I was very silly and said: "But how from *that*? one does not get children from that?" "Of course," she said, "I thought you knew that already. That time there was such a row with Mali about the waistband, I thought you and Hella had heard all about everything." Then I was silly again, really frightfully stupid; for instead of telling her what I really knew I said: "Oh, yes, I knew all about it except just that." Then she burst out laughing and said: "After all, what you and Hella know doesn't amount to much." And in the end she told me a *little*. If it's really as Dora says, then she is right when she says it is better not to marry. One can fall in love, one must fall in love, but one can just break off the engagement. Well, that's the best way out of the difficulty for then no one can say that you've never had a man in love with you. We walked up and down in front of the school for such a long time that we were very nearly late and only got in just as the bell rang. On the way home I told Hella the awful thing we'd seen the man do. She does not know either what "abnormal" really means *as far as this is concerned*. But now we shall use it as an expression for something horrible. Of course no one will understand us. And then Hella told me about a drunken man who in Nagy K. . . . was walking through the streets *like that* and was arrested. She says *too* that one can never forget seeing anything like *that*. Perhaps the man this morning was drunk too. But he didn't look as if he were drunk. And if he hadn't done *that* one would really have taken him for a fine gentleman. Hella knows too that it is from *that* that one gets children. She explained it all to me and now I can quite understand that *that* must make one ill. Yesterday it was after 11 at night and so I'm finishing to-day. Hella says: *That* is the original sin, and *that* is

the sin which Adam and Eve committed. Before I had always believed the original sin was something quite different. But that — that. Since yesterday I've been so upset I always seem to be seeing *that*; really I did not look at all, but I must have seen it all the same.

March 30th. I don't know why, but in the history lesson to-day it all came into my head once more what Dora had said of Father. But I really can't believe it. Because of Father I'm really sorry that I know it. Perhaps it does not all happen the way Dora and Hella say. Generally I can trust Hella, but of course she may be mistaken.

April 1st. To-day Dora told me a lot more. She is quite different now from what she used to be. One does not say P[eriod], but M[enstruation]. Only common people say P — . Or one can say one's *like that*. Dora has had M — since August before last, and it is horribly disagreeable, because men always know. That is why at the High School we have only three men professors and all the other teachers are women. Now Dora often does not have M — and then sometimes it's awfully bad, and that's why she's anemic. That men always know, that's frightfully interesting.

April 4th. We talk a lot about such things now. Dora certainly knows more than I do, that is not more but better. But she isn't quite straightforward all the same. When I asked her how she got to know about it all, whether Erika told her or Frieda, she said: "Oh, I don't know; one finds it all out somehow; one need only use one's eyes and one's ears, and then one can reason things out a little." But seeing and hearing don't take one very far. I've always kept my eyes open and I'm not so stupid as all that. One must be told by some one, one *can't* just happen upon it by oneself.

April 6th. I don't care about paying visits now. We used always to like going to see the Richters, but to-day I found it dull. Now I know why Dora hates going second class on the Metropolitan. I always thought it was only to spite me because I like travelling second. She never likes going second since *that* happened. It seems one is often unjust to people who never meant what one thought. But why did she not tell me the truth? She says because I was still a child then. That's all right, but what about this winter when I was cross because we went Third class to Schonbrunn; I really believed she did it to annoy me, for I could not believe she was afraid that in the second class, where one is often alone, somebody would suddenly attack her with a knife. But now I understand quite well, for of course she

could not tell Mother the truth and Father still less. And in winter and spring there are really often no passengers to speak of on the Metropolitan, especially on the Outer Circle.

April 7th. Mother said to-day that at the Richters yesterday we, especially I, had been frightfully dull and stupid. Why had we kept on exchanging glances? We had been most unmannerly. If she had only known what we were thinking of when Frau Richter said, the weather to-day is *certainly quite abnormal*; we have not had such *abnormal* heat for years. And then when Herr Richter came home and spoke about his brother who had spent the whole winter at Hochschneeberg and said: Oh, my brother is a little *abnormal*, I think he's got a tile loose in the upper storey, I really thought I should burst. Luckily Frau R. helped us once more to a tremendous lot of cake and I was able to lean well forward over my plate. And Mother said that I ate like a little glutton and just as if I never had any cake at home. So Mother was *very* unjust to me, for the cake had nothing at all to do with it. Dora says too that I must learn to control myself better, that if I only watch her I'll soon learn. That's all very well, but why should one have to bother? If people did not use words that really mean something quite different then other people would not have to control themselves. Still, I must learn to do it somehow.

April 8th. We were terribly alarmed to-day; quite early, at half past 8, they telephoned from the school that Dora had suddenly been taken ill in the Latin lesson and must be fetched in a carriage. Mother drove down directly in a taxi and I went with her because anyhow my lessons began at 9 and we found Dora on the sofa in the office with the head sitting by her and the head's friend, Frau Doktor Preisky, who is a medical doctor, and they had loosened her dress and put a cold compress on her head for she had suddenly fainted in the Latin lesson. That's the third time this year, so she must really have anemia. I wanted to drive home with her, but Mother and Frau Dr. P. said I'd better just go to my lessons. And as I went out I heard Frau Dr. P. say: "That's a fine healthy girl, a jolly little fellow." Really one should only use that word of boys and men, but I suppose she has got into the way of using it through being with men so much. If one studies medicine one has to learn all about *that* and to look at everything. It must be really horrid.

Dora is kept in bed to-day and our Doctor says too that she's anemic. To-morrow or the day after Mother is going to take her to see a specialist.

Dora says it's a lovely feeling to faint. Suddenly one can't hear what people are saying and one feels quite weak and then one does not know anything more. I wonder if I shall ever faint? Very likely when —— — We talked a lot about everything we are interested in. In the afternoon Hella came to ask after Dora, and she thinks she looks awfully pretty in bed, an interesting invalid and at the same time so distinguished looking. It's quite true, we all look distinguished.

April 9th. To-day is Father and Mother's *wedding day*. Now I know *what* that really means. Dora says it can't really be true that it is the most lovely day in one's life, as everyone says it is, especially the poets. She thinks that one must feel frightfully embarrassed because after all everyone knows. . . . That's quite true, but after all one need not tell anyone which one's wedding day is. Dora says she will never tell her children which her wedding day is. But it would be a great pity if parents always did that for then in every family there would be one anniversary the less. And the more anniversaries there are, the jollier it is.

April 10th. To-morrow I'm going with Father to Salzburg. Dora can't come, for they think she might faint in the train. I'm rather glad really, though I've nothing against her and I'm sorry for her, but it's much nicer to go with Father alone. It's a long time since I was in Salzburg. I'm so awfully glad to go. Our spring coats and skirts are so pretty, dark green with a silk lining striped green and gold-brown, and light brown straw hats with daisies for the spring and later we shall have cherries or roses. I'm taking my diary so that I can write everything which *interests* me.

April 12th. I slept all the way in the train. Father says I ground my teeth frightfully and was very restless: but I did not know anything about it. We had a compartment by ourselves, except just at first when there was a gentleman there. Hella did not come with us, because her aunt, who has just been married, is coming to visit them. Really I'm quite glad, for I like so much being with Father quite alone. This afternoon we were in Hellbrunn and at the Rock Theatre. It is wonderful.

April 13th. Father always calls me: Little Witch! But I don't much like it when other people are there. To-day we went up the Gaisberg. The weather was lovely and the view magnificent. When I see so extensive a view it always makes me feel sad. Because there are so many people one does not know who perhaps are very nice. I should like to be always travelling. It would be splendid.

April 14th. I nearly got lost to-day. Father was writing a letter to Mother and he let me go to see the salt works; I don't know how it happened, but suddenly I found myself a long way from anywhere, in a place I did not know. Then an old gentleman asked me what I was looking for; because I had walked past the same place 3 times and I said we were staying in the "Zur Post Hotel" and I did not know how to find my way back. So he came with me to show me and as we were talking it came out that he had known Father at the university. So he came in with me and Father was awfully glad to see him. He is a barrister in Salzburg but he has a grey beard already. As he was going away he said in an undertone to Father: "I congratulate you old chap on your daughter; she'll be something quite out of the ordinary!" He whispered it really, but I heard all the same. We spent all the afternoon with him at the Kapuzinerberg. There was a splendid military band; two young officers in the Yagers who were sitting at the next table to ours kept on looking our way; one was particularly handsome. My new summer coat and skirt is awfully becoming everyone says. Father says too: "I say, you'll soon be a young lady! But don't grow up too quickly!" I can't make out why he said that; I should like to be quite grown up; but it will be a long time yet.

April 14th. It's been raining all day. How horrid. One can't go anywhere. All the morning we were walking about the town and saw several churches. Then we were at the pastrycook's, where I ate 4 chocolate eclairs and 2 tartlets. So I had no appetite for dinner.

April 15th. Just as I was writing yesterday Dr. Gratzl sent up the hotel clerk to ask us to dinner. We went, they live in the Hellbrunnerstrasse. He has 4 daughters and 2 sons and the mother died three years ago. One of the sons is a student in Graz and the other is a lieutenant in the army; he is engaged to be married. The daughters are quite old already; one of them is 27 and is engaged. I think that is horrid. The youngest (!!!) is 24. It is so funny to say "the youngest" and then she is 24. Father says she is very pretty and will certainly get married At 24!! when she's not even engaged yet; I don't believe she will. They have a large garden, 3 dogs and 2 cats, which get on very well together. There are steps leading up and down from room to room, it is lovely, and all the windows are bow-windows. Everything is so old-fashioned, even the furniture I do think it's all so pretty. The hall is round like a church. After tea we had candied fruits, stewed fruit, and pastries. I had a huge go of stewed fruit. They have a

gramaphone and then Leni and I played the piano. Just as we were going away Fritz, the student, came in; he got quite red and in the hall Dr. Gratzl said to me: “You’ve made a conquest to-day.” I don’t really believe I have, but I do like hearing it said. I’m sorry to say we are going away to-morrow, for we are going to stay 2 days in Linz with Uncle Theodor whom I don’t know.

April 17th. Uncle Theodor is 60 already and Aunt Lina is old too. Still, they are both awfully nice. I did not know them before. We are staying with them. In the evening their son and his wife came. They are my cousins, and they brought their little girl with them; I am really a sort of aunt of hers. It’s awfully funny to be an aunt when one is only 12 and 3/4 and when one’s niece is 9. To-day we went walking along the Danube. It only rained very gently and not all the time.

April 18th. We are going home to-day. Of course we have sent a lot of picture postcards to Mother and Dora and Hella; we sent one to Oswald too. He came home for Easter. I don’t know whether he will still be there to-morrow.

April 22nd. We’ve begun school again. Dora and I generally walk to school together since she does not go to the Latin lesson now because it was too great a strain for her. The specialist Mother took her to see wanted her to give up studying altogether, but she absolutely refuses to do that. But I’m very furious with her; she’s learning Latin in secret. When I came into the room the day before yesterday she was writing out words and she shut her book quickly instead of saying openly and honestly: Rita, don’t tell Father and Mother that I’m still studying in the evening: “I trust your word.” She could trust me perfectly well. There are plenty of things I could tell if I liked! Perhaps she fancies that I don’t see that the tall fair man always follows us to school in the morning. Hella has noticed him too, besides he is frightfully bald and must be at least 30. And I’m certain she would not talk as much as she does to Hella and me if it were not that she wants to talk about *that*. But this deceitfulness annoys me frightfully. Otherwise we are now quite intimate with one another.

April 24th. We went to confession and communion to-day. I do hate confession; though it’s never happened to me what many girls have told me, even girls in the Fifth. No priest has ever asked me about the 6th commandment; all they’ve asked is: In thought, word, or deed? Still, I do hate going to confession, and so does Dora. It’s much nicer for Hella as a

Protestant for they have no confession. And at communion I'm always terrified that the host might drop out of my mouth. That would be awful. I expect one would be immediately excommunicated as a heretic. Dora was not allowed to come to confession and com., Father would not let her. She must not go out without her breakfast.

April 26th. In the Third there really is a girl who dropped the host out of her mouth. There was a frightful row about it. She said it was not her fault the priest's hand shook so. It's quite true, he was very old, and that is why I'm always afraid it will happen to me. It's much better when the priest is young, because then that can never happen. Father says that the girl won't be excommunicated for this, and luckily one of her uncles is a distinguished prelate. He is her guardian too. That will help her out.

April 27th. To-day we got to know this girl in the interval. She is awfully nice and she says she really did not do it on purpose for she is frightfully pious and perhaps she's going to be a nun. I am pious too, we go to church nearly every Sunday, but I would not go into a convent, not I. Dora says people generally do that when they've been crossed in love, because then the world seems empty and hateful. She looked so frightfully sentimental that I said: Seems to me you've a fancy that way yourself? Then she said: "No, thank goodness, I've no reason for that." Of course what she meant was that she was not crossed in love but the other way. No doubt the tall man in the mornings. I looked hard at her for a long time and said: "I congratulate you on your good fortune. But Hella and I wish he was not bald," then she said with an astonished air: "Bald? What are you talking about, he has the lofty brow of a thinker."

27th. To-day Mademoiselle came for the first time. I have forgotten to say that Dora has to go out every day for two hours to sit and walk in the sunshine. Since Mother is not very well and can't walk much, we've engaged the Mad. Father says that when I have time I must go too "as a precautionary measure." I don't like the idea at all, it's much too dull; besides I have simply no time. Mad. is coming 3 times a week, Mondays, Wednesdays, and Fridays, and on Mondays, Thursdays, and Saturdays I have my music lesson, so I can't go; so Finis and Jubilation! That's what Oswald always says at the end of the year and at the end of term. Still, she's very pretty, has fair curly hair, huge grey eyes with black lashes and eyebrows, but she speaks so fast that I can't understand all she says. On the other 3 days an Englishwoman is to come, but we have not got one yet,

they are all so expensive. It does seem funny to me to get a salary for going out with *grown up girls*, that's only an amusement. With regular tomboys, such as we saw last year in Rathaus Park, it would be different. As for the French or English conversation! If they did not want to talk what would it matter? And besides why should one want to talk either French or English, it's so stupid.

April 28th. The Richters were here to-day, and the eldest son came too, the lieutenant from Lemberg; he is awfully handsome and made hot love to Dora; Walter is very nice too, he is at the School of Forestry in Modling; to-morrow the lieutenant is going to bring Dora one of Tolstoi's books to read. Then they will do some music together, she piano and he violin; it's a pity I can't play as well as Dora yet. At Whitsuntide Walter is coming too and Viktor (that means conqueror) is on furlough for 6 months, because he's ill, or because he is said to be ill; for one does not look like *that* when one is really ill.

May 4th. Lieutenant R. is always coming here, he must be frightfully smitten with Dora. But Father won't have it at any price. He said to Dora to-day:

"You get this gay young spark out of your head; he is no good. But at sight of a uniform there is no holding you girls. I've no objection to you doing music together for an hour or two; but this perpetual running to and fro with books and notes is all humbug."

May 6th. Lieutenant R. walks with us, that is with Dora, to school every day. He is supposed to lie in bed late every morning, for he is really ill but for Dora's sake he gets up frightfully early and comes over from Heitzing and waits in —— Street. Of course I go on alone with Hella and we all meet In —— Street, so that no one shall notice anything at school.

May 13th. To-morrow is Mother's birthday and Viktor (when I am talking about him to Dora I always speak of him as V.) brought her some lovely roses and invited us all to go there next Sunday. In the hall he called me "the Guardian Angel of our Love." Yes, that is what I am and always shall be; for he really deserves it and Dora too is quite different from what she used to be. Hella says one can see for oneself that love ennobles; up till now she has always thought that to be mere poetical fiction.

May 15th. Father said: I don't care much about these visits to the Richters as long as that *young jackanapes* is still there, but Mother can't very well refuse. We shall wear our green coats and skirts with the white

blouses with the little green silk leaves for Dora does not like to wear all white except in summer. And because the leaves on the blouses are *clover leaves*, that is because of their meaning. We are looking forward to it tremendously. I do hope Mother will be all right, for she is in bed to-day. It's horrid being ill anyhow, but when being ill interferes with other people's pleasure it's simply frightful.

May 16th. The day before yesterday was Mother's birthday; but it was not so jolly as usual because Mother is so often ill; for a birthday present I painted her a box with a spray of clematis, which looks awfully chic. Dora gave her a book cover embroidered with a spray of Japanese cherries, I don't know what Father gave her, money I think, because on her birthday and name day he always hands her an envelope. But since Mother is not well we were not very cheerful, and when we drank her health at dinner she wiped her eyes when she thought we were not looking. Still, it's not so dangerous as all that; she is able to go out and doesn't look bad. I think Mother's awfully smart, she looks just as well in her dressing gown as when she's dressed up to go out. Dora says that if she had been made ill by her husband she would hate him and would never let her daughters marry. That's all very well, but one ought to be quite *sure* that *that* is why one has become ill. They say that is why Aunt Dora doesn't like Father. Certainly Father is not so nice to her as to other relations or to the ladies who some to see Mother. But after all, Aunt Dora has no right to make *scenes* about it to Father, as Dora says she does. Mother's the only person with any right to do that. Dora says she is afraid that it will come to Mother's having to have an operation. Nothing would ever induce me to undergo an operation, it must be horrible, I know because of Hella and the appendicitis. But Dora says: "Anyone who's had five children must be used to that sort of thing." I shall pray every night that Mother may get well without an operation. I expect we shan't all go away together at Whitsuntide this year, for Mother and Dora are to go to a health resort, most likely to Franzensbad.

May 18th. It was lovely at the Richters; Walter was there from Modling, he was awfully nice, and said I was so like my sister that it was difficult to tell us apart. That's a frightful cram, but I know what he really meant. He plays the flute splendidly, and the three played a trio, so that I was frightfully annoyed with myself for not having worked harder at my music. From to-morrow on I shall practice 2 hours every day, if I can possibly find time. Next winter Viktor is going to found a private dramatic

club, so he must be going to stay more than six months in Vienna. Walter thinks Dora awfully charming, and when I said: “The great pity is that she’s got such frightful anemia,” he said: In a man’s eyes that is no drawback whatever, as you can see in my brother. Moreover, that illness is not a real illness, but often makes a girl more charming than ever, as you can see in your sister.

Day before yesterday Miss Maggie Lundy came for the first time; anybody can have her for me. She wears false hair, flaxen. She says she is engaged, but Dora says, has been. I simply don’t believe it. V. says Mad. is awfully pretty. When I asked Dora if she was not jealous, she said she didn’t care, she was quite sure of his love. He means to leave the army and go into the civil service, and then he will be able to marry. But Dora said, there’s plenty of time for that, a secret engagement is much nicer. Then she noticed she’d given herself away, and she blushed like anything and said: You naturally must be engaged before you are married, mustn’t you? — of course she *is* secretly engaged, but she won’t tell me about it. What’s the good of my being the “Guardian Angel of their Love?” If he only knew.

May 19th. I really ought to practice to-day, but I simply have no time, first of all I had my lesson anyhow, and secondly something awful happened to Dora. She left her diary lying about in the school; and because we have our religion lesson in the Fifth I saw a green bound book lying under the third bench. Great Scott, I thought, that looks like Dora’s diary. I went up as quickly as I could and put my satchel over it. Later in the lesson I picked it up. When I got home at 1 o’clock I did not say anything at first. After dinner she began rummaging all over the place, but without saying anything to me, and then I said quite quietly: “Do you hap — pen to be look — ing for your di — ar — y? Here it is; you — left — it in — the — fifth — class — un — der — the — third — bench.” (I kept her on tenter hooks that way.) She got as white as a sheet and said: “You *are* an angel. If any one else had found it, I should have been expelled and Mad. would have had to drown herself.” “Oh, it can’t be as bad as all that,” I said, for what she said about Mad. was frightfully exciting. In class I had looked chiefly at what she had written about V. But I could not read it there, because it was written very small and close together and was several pages, but I had not looked much at what she had written about Mad. “Did you read it?” “No, only where it happened to come open because there’s a page torn out.” “About V. or about Mad?” “A little about Mad; but tell me

all about it; I shan't tell anyone. For if I'd wanted to betray you, you know quite well. . . ." And then she told me all about Mad. But first I had to promise that I would not even tell Hella. Mad. is secretly engaged to a man to whom she has given "the utmost gifts of love," that is to say she has . . . . She is madly in love with him, and they would marry directly but he is a lieutenant too, and they have not enough money for the security. She says that when one really loves a man one can bear everything for his sake. She has often been to his rooms, but she has to be frightfully careful for her father would kill her if he found out. Dora has seen the lieutenant and says he is very handsome, but that V. is much handsomer. Mad. says that you can't trust men as a rule, but that her lover is quite different, that he is true as steel. I am sure V. is too.

May 21st. When Mad. came to-day I simply could not look at her while Mother was there and Dora says I made an awful fool of myself. For I went out walking with them to-day, and when we met a smart-looking officer I hemmed and looked at Dora. But she didn't know why. Mad. is the daughter of a high official in the French military service and she only took her teacher's degree in order to get free from her Mother's "*tyranny*;" she nagged at her frightfully and until she began to give lessons she was never allowed to go out alone. Dora says she is very refined in her speech, especially when she is talking about *these* things. Of course about *them* she always speaks German, for it's much more difficult to say it in French, and probably Dora would not understand it and then Mad. would only have to translate it. She is called Sylvia and he calls her Sylvette. Mad. says that if one is madly in love with a man one does whatever he asks. But I don't see that one need do that, for he might ask the most idiotic things; he might ask you to get the moon out of the skies, or to pull out a tooth for his sake. Dora says she can understand it quite well; that I still lack *the true inwardness of thought and feeling*. It looks like utter nonsense. But since it sounds fine I've written it down, and perhaps I shall find a use for it some day when I'm talking to Walter. Mad. is always frightfully anxious lest she should get a baby. If she did she's sure her father would kill her. The lieutenant is in the flying corps. He hopes he's going to invent a new aeroplane, and that he will make a lot of money out of it. Then he will be able to marry Mad. But it would be awful if *something happened* and she got a baby already.

May 22nd. Dora asked me to-day how it was I knew all about these things, whether Hella had told me. I did not want to give Hella away, so I said quite casually: “Oh, one can read all about that in the encyclopedia.” But Dora laughed and said: “You are quite on the wrong scent; you can’t find a tenth of all those things in the encyclopedia, and what you do find is no good. In *these* matters it is *absolutely no good* depending on books.” First of all she would not tell me any more, but after a time she told me a good deal, especially the names of certain parts, and about *fertilisation*, and about the microscopic baby which really comes from the husband, and not as Hella and I had thought, from the wife. And how one knows whether a woman is *fruitful*. That is really an awful word. In fact almost every word has a second meaning of *that* sort, and what Dora says is quite true, one must be fearfully careful when one is talking. Dora thinks it would be best to make a list of all such words, but there are such a frightful lot of them that one never could. The only thing one can do is to be awfully careful; but one soon gets used to it. Still it happened to Dora the other day that she said to V.: I don’t want any *intercourse*. And that really means “the utmost gifts of love,” so Mad. told her. But V. was so well-mannered that he did not show that he noticed anything; and it did not occur to Dora until afterwards what she had said. It’s really awfully stupid that every ordinary word should have such a meaning. I shall be so frightfully careful what I say now, so that I shan’t use any word with two meanings. Mad. says it’s just the same in French. We don’t know whether it is the same in English and we could never dream of asking that awful fright, Miss Lundy. Very likely she does not know the first thing about it anyhow. I know a great deal more than Hella now, but I can’t tell her because of betraying Dora and Mad. Perhaps I can give her a hint to be more careful in what she says, so as not to use any word with two meanings. That is really my duty as a friend.

May 23rd. I quite forgot. Last week Oswald had his written matriculation exam, he wrote a postcard every day and Mother was frightfully annoyed because he made such silly jokes all the time that we could not really tell how he got on. Dora and I are awfully excited because next Monday we are going to the aerodome with Frau Richter and her niece who is at the conservatoire. Lieutenant Streinz is going to fly too. Of course we’ll motor out because the railway is not convenient. Of course Viktor will be there, but he is motoring over with some other officers. It’s

a great pity, for it would have been lovely if he'd been in our car. By the way, I saved the class to-day, the school inspector has been this week and examined our class first in History and then in German, and I was the only one who knew all that Frau Doktor M. had told us about the Origin of Fable. The insp. was very complimentary and afterwards Frau Doktor M. said: its quite true one can always depend upon Lainer; she's got a trustworthy memory. When we were walking home she was awfully nice: "Do you know, Lainer, I feel that I really must ask your pardon." I was quite puzzled and Hella asked: But why? She said: "It seemed to me this year that you were not taking quite so much interest in your German lessons as you did last year; but now you've *reinstated* yourself in my good opinion." Afterwards Hella said: I say you know, Frau Doktor M. is not so far wrong when I think of all that we used to read last year so that we might know everything when the lesson came, and when I think of what we do this year!!! You know very well —— —— . Hella is quite right, but still one can learn in spite of *those things*, one can't be *always* talking about them. And then it's quite easy to learn for such an angel as Frau Doktor M. Hella says that I got as red as a turkey cock from pride because I could say it all in the very words of Frau Doktor M., but it was not so, for first of all I was not a bit puffed up about it, and secondly I really don't know myself how I managed to say it all. I only felt that Frau Doktor M. is so annoyed when no one offers to answer a question, and so I took it on.

May 25th. Confound it, I could slap myself a hundred times. How could I be so stupid! Now we're not allowed to go to the aerodome. Father only let us go because Viktor is in Linz and Father believed he was going to stay there another fortnight. And at dinner to-day I made a slip and said: "It is a pity there's no room for five in our car. If Fraulein Else were not coming Lieutenant Richter could come with us." Dora kicked me under the table and I tried to brazen it out, but Father was so angry and said. "Hullo, is the flying man coming? No, no, children, nothing doing. I shall make your excuses to Frau Richter directly. I'm not having any, did not I tell you you weren't to see the fellow any more?" Of course this last was to Dora. Dora did not say anything but she did not eat any pudding or fruit, and as soon as we were back in our room she gave it me hot, saying: You did that on purpose, you little beast, but really you are only a child whom I never ought to have trusted, and so on. It's really too bad to say I did it *on*

purpose, as if I envied her. Besides it's bad for me as well as for her, for I like him very much too, for he makes no difference between us and treats me exactly like Dora. Of course we are not on speaking terms now, and what infuriated me more than anything was that she said she grudged every word she had said to me in *this* connection: "Pearls before Swine." What a rude thing to say. So I am an S. But I should like to know who told most. I forsooth? Anyhow I'm quite sure that I shall never talk to her again about *anything of that sort*. Thank goodness I have a friend in Hella. She would never say or think anything of the kind of me.

May 26th. Neither of us could sleep a wink all night; Dora cried frightfully, I heard her though she tried to stifle it, and I cried too, for I was thinking all the time what I could do to prevent Viktor from thinking unkindly of me. That would be awful. Then I thought of something, and chance or I ought to say luck helped me. Viktor does not walk to school with us any longer, because the girls of the Fifth have seen us several times, but he comes to meet Dora when she comes away at 1 o'clock. So quite early I telephoned to him at a public telephone call office, for I did not dare to do it at home. Dora was so bad that she could not go to school so I was going alone with Hella. I telephoned saying a friend was ringing him up, that was when the maid answered the telephone, and then she called him. I told him: that whatever happened he was not to think unkindly of me and I must see him at 1 o'clock because Dora was ill. He must wait at the corner of —— Street. All through lessons I was so upset that I don't in the least know what we did. And at 1 o'clock he was there all right, and I told him all about it and he was so awfully kind and he consoled me; *he* consoled *me*. That's quite different from the way Dora behaved. I was so much upset that I nearly cried, and then he drew me into a doorway and *put his arm round me* and with his *own* handkerchief wiped away my tears. I shall never tell Dora about that. Then he asked me to be awfully kind to Dora because she had such a *lot* to bear. I don't really know *what* she has to bear, but still, for his sake, because it's really worth doing it for that, after dinner I put a note upon her desk, saying: V. sends oceans of love to you and hopes you will be all right again by Monday. At the same time his best thanks for the book. I put the note in Heidepeter's Gabriel, which she had lent to me to read and put it down very significantly. When she read it she flushed up, swallowed a few times and said: "Have you seen him? Where was it and when?" Then I told her all

about it and she was frightfully touched and said: “You really are a good girl, only frightfully undependable.” What do you mean, undependable? She said: Yes undependable, for one simply must not blurt out things in that way; never mind, I will try to forget. Have you finished Heidepeter’s Gabriel yet? “No,” I said, “I’m not going to read anyone’s book with whom I’m angry.” In the end we made it up, but of course we did not talk any more about it and I did not say a word about that business with the handkerchief.

May 29th. On June 10th or 12th, Mother and Dora are going to Frazensbad, because they both have to take mud baths. Besides, Father says that a change will give Dora new thoughts, so that she won’t go about hanging her head like a sick chicken. To-day Dora told me something very interesting. Unmarried men have little books and with these they can go to visit women “of a certain kind” in Graben and in the Karntnerstrasse. There, Dora says, they have to pay 10 florins or 10 crowns. In Dora’s class there is a girl whose father is police surgeon, and they have all to be examined every month to see if they are healthy, and if not they can’t visit these “ladies,” and that’s why the Preusses can never keep a servant. In my bath yesterday I noticed that I had a certain line, so I must be fr — . But I shan’t have more than 1 or 2 children at most for the line is very faint. When I’m studying I often think of such things, and then I read a whole page and turn over and have not the remotest idea what I’ve been reading. It’s very tiresome, for soon the other school insp. for maths. and the other subjects is coming, and I should not like to make a fool of myself; especially not because perhaps the inspectors talk us over with one another about who is clever and who stupid.

May 30th. The concert was glorious. When I hear such grand music I always have to keep myself well in hand for I fear I should cry. It’s very stupid, of course, but at such times I can only think of sad things, even if it’s just a small piece. Dora can play Brahms’ Hungarian Dances, too, but that never makes me want to cry. I only get annoyed because I can’t play them myself. I could all right, but I have not got patience to practice long enough. I never tell anyone that I want to cry when I am listening to music, not even Hella, though I tell her everything, except of course about Mad. Yesterday I made a fool of myself; at least so Dora says. I don’t know how it happened, we were talking about books at supper, and I said: “What’s the use of books, one can’t learn anything out of them; everything

is quite different from what they say in books." Then Father got in a wax and said: "You little duffer, you can thank your stars there are books from which you can learn something. Anyone who can't understand a book always says it is no good." Dora gave me a look, but I didn't know what she meant, and I went on: "Yes, but there's an awful lot that the encyclopedia puts all wrong." "What have you been ferreting in the encyclopedia for; we shall have to keep the key of the bookcase in a safer place." Thank goodness Dora came to my help and said: "Gretel wanted to look up something about the age of elephants and mammoths, but it's quite different in the encyclopedia from what Prof. Rigl told her last year." I was saved. Dora can act splendidly; I've noticed it before. In the evening she rowed me, and said: "You little goose, will you never learn caution; first that stupidity about Viktor and to-day this new blunder! I've helped you out of a hole once but I shan't do it again." And then she spent all the time writing a letter, to him of course — ! Hella and I have just been reading a lot of things in the encycl., about *Birth* and *Pregnancy*, and I on my own about abor — ; we came across the words Embyro and Foetus, and I said nothing at the time but tied 2 knots in my handkerchief to remind me, and yesterday I looked them up. Mad. need not be anxious even if she *really* did get like that. But every doctor knows about it and one often dies of it. I wonder if Mad. knows anything about it. We were talking about the *differences* between men and women, and it came out that when Hella has her bath she is still washed by Anna who has been with them for 12 years. Nothing would induce me to allow that, I would not let anyone wash me, except Mother; certainly not Dora, for I don't want her to know what *I* look like. The nurse in the hosp. told Hella that she is developed just like a little nymph, so lovely and symetrical. Hella says that is nothing unusual, that every girl looks like that, that the female body is *Nature's Work of Art*. Of course she's read that somewhere, for it does not really mean anything. *Nature's* work of art; it ought to be: a work of art made by husband and wife!!!

May 30th. Dora and Mother are going to Franzensbad on June 6th, directly after Whitsuntide. Dora has got another new coat and skirt, grey with blue stripes; yesterday our white straw hats came, it suits me very well says Hella and everyone, with white ribbons and wild roses. There might have been a fearful row about what's just happened. When I went to telephone I had my Christmas umbrella with the rose-quartz handle and I

left it in the telephone box; the girl in the tobacco shop found it there, and as she knows me she brought it here and gave it to the porter who brought it upstairs. Thank goodness it occurred to me at once to say that I went into the tobacco shop to buy stamps and I must have left it in the *shop*. No one noticed anything.

May 31st. They wanted me to go and stay with Hella for the month when Mother and Dora are away. It would be awfully nice, but I'm not going to, for I want to stay with Father. What would he do all alone at meal times, and whom would he have to talk to in the evenings? Father was really quite touched when I said this and he stroked my hair as he can and no one else, not even Mother. So I'm going to stay at home whatever happens. Flowers are very cheap now, so I shall put *different* flowers on the table every day, I shall go to the Market every day to buy a little posy, so that they can always be fresh. It would be stupid for me to go to the Brs., why should I, Resi has been with us for such a long time, she knows how to do everything even if Mother is not there and everything else I can arrange. Father won't want for anything.

June 1st. We've had such an experience to-day! It's awful; it's quite true then that one takes off *every stitch* when one is madly fond of anyone. I never really believed it, and I'm sure Dora did not, although Mad. hinted it to her; but *it's true*. We've seen it *with our own eyes*. I was just sitting and reading Storm's The Rider of the Grey Horse and Dora was arranging some writing paper to take to Franzensbad when Resi came and said: Fraulein Dora, please come here a moment, I want you to look at something! From the tone of her voice I saw there was something up so I went too. At first Resi would not say what it was but Dora was generous and said: "It's all right, you can say *everything* before her." Then we went into Resi's room and from behind the curtain peeped into the mezzanin. A young *married couple* live there!!! At least Resi says people say they are *not* really married, but simply live together!!!! And what we saw was awful. She was absolutely naked lying in bed without any of the clothes on, and he was kneeling by the bedside quite n — too, and he kissed her all over, *everywhere!!!* Dora said afterwards it made her feel quite sick. And then he stood up — no, I can't write it, it's too awful, I shall never forget it. So *that's* the way of it, it's simply frightful. I could never have believed it. Dora went as white as a sheet and trembled so that Resi was terribly frightened. I nearly cried with horror, and yet I could not help laughing

too. I was really afraid he would stifle her because he's so big and she's so small. And Resi says he is certainly much too big for her, and that he nearly tears her. I don't know why he should tear her but certainly he might have crushed her. Dora was so terrified she had to sit down and Resi hurried to get her a glass of water, because she believed she was going to faint. I had not imagined it was anything like *that*, and Dora certainly had not either. Or she would never have trembled so. Still I really don't see why she should tremble like that. There is no reason to be frightened, one simply need not marry, and then one need never strip off every stitch, and oh dear, poor Mademoiselle who is so small and the lieutenant is very tall. But just think if anyone is as fat as Herr Richter or our landlord. Of course Herr Richter is at least 50, but last January the landlord had another little girl, so something *must have happened*. No, I'm sure it's best not to marry, for *it* is really too awful. We did not look any more for then came the worst, suddenly Dora began to be actually sick, so that she could hardly get back to our room. If she had not been able to, everything would have come out. Mother sent for the doctor directly and he said that Dora was very much overworked; that it was a good thing she was going away from Vienna in a few days. No girl ought to study, it does not pay. Then he said to me: "You don't look up to much either. What are you so hollow-eyed for?" "I'm so frightened about Dora," I said. "Fiddlededee," said the doctor, "that does not give anyone black rings round the eyes." So it must be true that one gets to look ill when one always has to think about *such* things. But how can one help it, and Hella says: It's awfully interesting to have black rings under the eyes and men *like* it.

We were going to make an excursion to-morrow to Kahlenberg and Hermannskogel, but probably it won't come off. Its 11 already and I'm fearfully tired from writing so much; I must go to bed. I do hope I Shall be able to sleep, but —— ——

June 3rd. Father took Hella and me to Kahlenberg; we enjoyed ourselves tremendously. After dinner, when Father was reading the paper in the hotel, we went to pick flowers, and I told Hella all about what we'd seen on Friday. She was simply speechless, all the more since she had never heard what Mad. told us about taking off everything. She won't marry either, for it's too disagreeable, indeed too horrid. — The doctor said too: This perpetual learning is poisonous for young girls *in the years of development*. If he only knew *what* we had seen. Hella is frightfully

annoyed that she was not there. She can be jolly glad, I don't want to see it a second time, and I shall never forget it all my life long; what I saw at the front door was nothing to this. Then Hella went on making jokes and said: "I say, just think if it had been Viktor." "Oh, do shut up," I screamed, and Father thought we were quarrelling and called out: "You two seem to be having a dispute in the grand style." If he'd only known what we were talking about!!! Oswald has been home since Friday evening; he did not arrive till half past 10. But he did not come on the excursion with us yesterday, although Father would have liked him to; he said he would find it much too dull to spend the day with two "flappers;" that means that we're not grown up enough for him and is a piece of infernal cheek especially as regards Hella. She says she will simply ignore him in future. Since I am his sister I can't very well do that, but I shan't fetch and carry for him as he would like me to. He's no right to insult even his sister.

Dora has just said to me: It's horrible that one has to endure that (you know what!!! —— ——) when one is married. Resi had told her about those two before, and that only the Jews do it just like *that*. She said that other people did not strip quite naked and that perhaps it's different in some other ways!! —— — But Mad. implied that it was just *that* way, only she did not say anything about the crushing; but I suppose that's because of the cruelty of the Jews —— — . I'm afraid every night that I'm going to dream about it, and Dora has dreamed about it already. She says that whenever she closes her eyes she sees it all as if it were actually before her.

June 4th. We understand now *what* Father meant the other day when he was speaking about Dr. Diller and his wife and said: "But they don't suit one another at all." I thought at the time he only meant that it looks so absurd for so tiny a woman to go about with a big strong man. But that's only a minor thing; the main point is something quite different!!!! Hella and I look at all couples now who go by arm in arm, thinking about them from *that* point of view, and it amuses us so much as we are going home that we can hardly keep from laughing. But really it's no laughing matter, especially for the woman.

June 5th. This morning Mother took Dora with her to pay a farewell call at the Richter's. But there was no one at home, that is Frau R. was certainly at home, but said she was not because they are very much offended with Father. In the afternoon Dora and I had a lot of things to get,

and we met Viktor, by arrangement of course. Dora cried a lot; they went into the Minorite church while I went for a walk in Kohlmarkt and Herrengasse. He is going to America in the beginning of July, before Dora comes home. He has given her some exquisite notepaper stamped with his regimental arms, specially for her to write to him on, and a locket with his portrait. To-morrow she is going to send him her photo, through me, I shall be awfully glad to take it. Dora has been much nicer to me lately.

June 6th. Mother and Dora left early this morning. Mother has never gone away from us before for long at a time, so I cried a lot and so did she. Dora cried too, but I know on whose account. Father and I are alone now. At dinner he said to me: “My little housewife.” It was so lovely. But it’s frightfully quiet in the house, for 2 people don’t talk so much as 4. It made me feel quite uncomfortable. To-day I talked several things over with Resi. What I think worst of all is that one saw the whole of his behind, it was really disgusting. Dora said the other day she thought it was positively infamous. Resi said they might at least have pulled down the blind so that nobody could see in, that’s what respectable people would do. But *respectable* people simply would not strip, or at least they’d cover themselves respectably with the bedclothes. Then Resi told me some more about the bank clerk and his wife, that is *not*-wife. She does not know if her parents know about it, and what excuse she makes for not living at home. She is not a Jewess, though he is a Jew. Resi absolutely curled up with laughing because I said: “Ah, that is why he insists that they shall *both* strip though ordinarily only the wife has to strip.” But she herself said a little while ago that only Jews do it *that way*, and to-day she laughed as if I were talking utter nonsense. Really she does not know exactly herself, and she cloaks it with laughter because she’s annoyed, first because *she* does not know, and then also I’m sure because she really began to talk about the matter. One thing that puzzles me is that I never dream about *it*. I should like to know whether perhaps Dora never really dreamed of it, though she pretended she did. As for Hella saying she dreamed of it the day before yesterday, I’m sure that was pure invention, for she was not there at all. She says it’s a good thing she was not for if she had been she would have burst out laughing. But I fancy if she’d seen what we saw she would have found there was nothing to laugh at.

June 7th. It’s frightfully dull after dinner and in the evening before bed time, especially because this year, since the affair at the front door, Dora

and I have always had plenty to talk about. I miss it. I wish Hella would come and stay with us for the 4 weeks. But she does not want to. Father had work to do to-day, so I'm quite alone and feel as if I'd like to cry.

June 9th. Yesterday, when I was feeling so melancholy, Resi came to make my bed, and we talked about the married couple opposite, and then she told me awful things about a young married couple where she was once. She left because they always went into the bath together; she says she's certain that *something happened* there. And then she told me about an old gentleman who made *advances* to her; but of course she would not have anything to do with him; besides he was married, and anyhow he would never have married a servant for he was a privy councillor. Yesterday Father said: Poor little witch, it's very lonely for you now; but look here, Resi is no fit company for you; when your little tongue wants to wag, come to my room. And I was awfully stupid, I began to cry like anything and said. "Father, please don't be angry, I'll never think and never talk of such things any more." Father did not know at first what I meant, but afterwards it must have struck him, for he was so kind and gentle, and said: "No, no, Gretel, don't corrupt your youth with such matters, and when there's anything that bothers you, ask Mother, but not the servants. A girl of good family must not be too familiar with servants. Promise me." And then, though I'm so big he took me on his knee like a child and petted me because I was crying so. "It's all right, little Mouse, don't worry, you must not get so nervous as Dora. Give me a nice kiss, and then I'll come with you to your room and stay with you till you go to sleep." Of course I stayed awake on purpose as long as I could, till a quarter to 11.

And then I dreamed that Father was lying in Dora's bed so that when I woke up early in the morning I really looked across to see if he had not gone to bed there. But of course I'd only dreamed it.

June 12th. To-morrow there's a great school excursion; I am so glad, a whole day with Frau Doktor M. and without any lessons. We are going up Eisernes Tor. Last year there was no outing, because the Fourth did not want to go to the Anninger, but to the Hochschneeberg, and the Head did not want to go there.

June 13th. We had a lovely outing. Hella and I spent the whole day with Frau Doktor M.; in the afternoon Franke said: "I say, why do you stick to Frau Doktor like that? One can't get a word with you." So then we went for

a good walk through the forest with Franke and she told us about a student who is in the Eighth now and who is madly in love with her. For all students are in love with her, *so she says*. We were not much interested in that, but then she told us that Frau Doktor M. is secretly engaged to a professor in Leipzig or some other town in Germany. Her cousin is Frau Doktor's dressmaker, and she is quite certain of it. Her parents are opposed to it because he is a *Jew* but they are frantically in love with one another and they intend to marry. And then we asked Franke, since she is a Jewess too whether it was all true what Mali, who was here when Resi was in hospital, had told us about the Jews. And Franke said: "Oh yes, it is true I can confirm it in every point. But it's not so bad about the cruelty, every man is cruel, especially in this matter." No doubt she's right, but it's horrible to think that our lovely and refined Frau Doktor M is going to have a cruel husband. Hella says that if *she* is satisfied, I don't need to get excited about it. But perhaps she does not know that —— — . When we came out of the wood the Herr Religionsprofessor who is awfully fond of Frau Doktor M. called out: "Frau Doktor, you have lost your two satellites!" And everybody laughed because we'd come back. Father came to fetch Hella and me, and since it was nearly 11 o'clock Hella stayed the night with us. It was awfully nice, but at the same time I was sorry because I could not have any more talk with Father. When we were getting up in the morning we splashed one another and played the fool generally, so that we were nearly late for school. The staff was still in high spirits, including Professor Wilke, about whom we had not bothered ourselves all day; that is he did not come until the afternoon when he came to meet us on our way. We believe he is in love with Frau Doktor M. too, for he went about with her all the time, and it was probably on her account that he came. None of the other professors were there, for they were all taking their classes in the different Gymnasiums.

June 14th. I am so excited. We were going to school to-day at 9 and suddenly we heard a tremendous rattling with a sword; that is Hella heard it, for she always notices that sort of thing before I do, and she said: "Hullo, that's an o — in a frightful hurry," and looked round; "I say, there's Viktor behind us" and he really was, he was saluting us and he said: Fraulein Rita, can you give me a moment; you'll excuse me won't you, Fraulein Hella? He always calls me Rita, and it shows what a nice refined kind of a man he is that he should know my friend's name. Hella said

directly: “Don’t mention it, Herr Oberleutenant, don’t let me be in your way if it’s anything important,” and she went over to the other side of the street. He looked after her and said: “What a lovely, well-mannered young lady your friend is.” Then he came back to the main point He has already had 2 letters from Dora, but not an answer to his letter, because she can’t fetch it from the post office, *poste restante*. Then he implored me to enclose a letter from him in mine to Dora. But since Mother naturally reads my letters, I told him it was not so simple as all that; but I knew of a splendid way out of the difficulty; I would write to Mother and Dora *at the same time*, so that Dora could get hold of *his letter* while Mother was not noticing. Viktor was awfully pleased and said: “You’re a genius and a first-class little schemer,” and kissed my hand. Still, he might have left out the “little.” If one’s is so *little*, one can’t very well be a schemer. From the other side of the street Hella saw him kiss my hand. She says I did not try to draw it away, but held it out to him like a grand lady and even dropped it at the wrist. She says we girls of good family do that sort of thing by instinct. It may be so, for I certainly did not do it intentionally. In the afternoon I wrote the two letters, just the ordinary one to Mother and a short one to Dora with the enclosure, and took it to the post *myself*.

June 16th. I’ve already got so used to being alone with Father that I take it as a matter of course. We often drive in the Prater, or go in the evening to have supper in one of the parks, and of course Hella comes with us. I am frightfully excited to know what Dora will write. I forgot to write in my diary the other day that I asked Viktor if he was really going to New York. He said he had no idea of doing anything of the kind, that had only been a false alarm on the part of the Old Man. That’s what he calls his father. I don’t think it’s very nice of him, a little vulgar, and perhaps that is why Father can’t stand him. In fact Father does not like any officers very much, except Hella’s father, but then he’s fairly old already. I say, Hella mustn’t read that, it would put her in an awful wax; but her father really is at least 4 or 5 years older than Father.

June 17th. Frau Doktor M. is ill, but we don’t know what’s the matter with her. We were all frightfuly dull at school. The head took her classes and we were left to ourselves in the interval. I do hope she has not got appendicitis, that would be awful.

June 18th. *She* isn’t back yet. Frau Doktor Steiner says she has very bad tonsillitis and won’t be able to come for at least a week.

June 19th. There was a letter from Dora to-day. I'm furious. Not a word about my sisterly affection, but only: "Many thanks for your trouble." It's really too bad; *he* is quite different!! I shan't forget this in a hurry. Hella says that she only hinted at it like that to be on the safe side. But it's not true, for she knows *perfectly well* that Father never reads our letters. She simply takes it as a matter of course. Yesterday was the first time I stayed away from school since I went to the High School. Early in the morning I had such a bad sore throat and a headache, so Father would not let me go. I got better as the day went on, but this morning I was worse again. Most likely I shall have to stay at home for 2 or 3 days. Father wanted to send for the doctor, but it really was not necessary.

June 20th. When Resi was doing our room to day she wanted to begin talking once more about *various things*, but I said I did not particularly care to hear about such matters, and then she implored me never to tell Mother and Father anything about what she had said to us about the young married couple; she said she would lose her place and she would be awfully sorry to do that.

June 21st. My knees are still trembling; there might have been a frightful row; luckily Father was out. At half past 6, when Hella and I were having a talk, the telephone bell rang. Luckily Resi had gone out too to fetch something so I answered the telephone, and it was Viktor! "I must see you to-morrow morning early or at 1 o'clock; I waited for you *in vain* at 1 to-day." Of course, for I was still ill, that is still am ill. But well or ill I must go to school to-morrow. If Father had been at home; or even Resi, she might have noticed something. It would have been very disagreeable if I had had to ask her not to give me away. Hella was frightfully cheeky, she took the receiver out of my hand and said: "Please don't do this again, it's frightfully risky for my friend." I was rather annoyed with her, but Hella said he certainly deserved a lecture.

To-morrow we are going to a concert and I shall wear my new white dress. It does look rather nice after all for sisters to be dressed alike. I've taken to wearing snails, * * * Father calls them "cow-pats;" but everyone else says it's exceedingly becoming.

* * * Flat rolls of hair-plait covering the ears. — Translators'

Note.

June 22nd. He was awfully charming when he came up to us and said: “Can a repentant sinner be received back into grace?” And he gave each of us a lovely rose. Then he handed me a letter and said: “I don’t think we need make any secret before your energetic friend.” Really I did not want to forward any more letters but I did not know how to say so without offending him, for Dora’s cheek is not his fault, and I did not want to say anything to-day, 1 because of the roses, and 2 because Hella was there. There can’t be more than 2 or 3 times more, so I shan’t bother. But *Dora* doesn’t deserve it, really. Franke is a vulgar girl. She saw us together the other day, and the next day she asked: Where did you pick up that handsome son of Mars? Hella retorted: “Don’t use such common expressions when you are speaking of Rita’s cousin.” “Oh, a cousin, that’s why he kisses her hand I suppose?” Since then we only speak to Franke when we are positively obliged. Not to speak to her at all would be too dangerous, you never can tell; but if we speak only a little, she can’t take offence.

June 23rd. The school insp. came yesterday, the old one who always comes for Maths. He is so kind and gentle that all the girls can answer everything; we like him better than the one who comes for languages. Verbenowitsch was awfully puffed up because he praised her. Good Lord, I’ve been praised often enough, but that does not make *me* conceited. Anyhow he did not call on me yesterday because I’d been absent 4 days. Frau Doktor M. came back to-day. She looks awfully pale and wretched, I don’t know why; it’s such a pity that she does not let us walk home with her, except last year when there was all that fuss about Fraulein St.’s bead bag. She bows to us all very politely when we salute her, but she won’t walk with any of the pupils, though Verbenowitsch is horribly pushing and is always hanging about on the chance.

June 26th. It’s really stupid how anxious I am now at Communion lest the host should drop out of my mouth. I was so anxious I was very nearly sick. Hella says there must be some reason for it, but I don’t know of any, except that the accident which that girl Lutter in the Third had made me even more anxious that I was before. Hella says I’d better turn Protestant, but nothing would induce me to do that; for after Com. one feels so pure and so much better than one was before. But I’m sorry to say it does not last so long as it ought to.

June 27th. Mother is *really* ill. Father told me about it. He was awfully nice and said: If only your Mother is spared to us. She is far from well. Then I asked: Father, what is really wrong with Mother? And Father said: “Well, dear, it’s a hidden trouble, which has really been going on for a long time and has now suddenly broken out.” “Will she have to have an operation?” “We hope we shall be able to avoid that. But it’s a terrible thing that Mother should be so ill.” Father looked so miserable when he said this that I did my best to console him and said: “But *surely* the mud baths will make her all right, or why should she take them?” And Father said: “Well, darling, we’ll hope for the best.” We went on talking for a long time, saying that Mother must take all possible care of herself, and that perhaps in the autumn Aunt Dora would come here to keep house. I asked Father, “Is it true that you don’t like Aunt Dora?” Father said: “Not a bit of it, what put that idea into your head?” So I said: “But you do like Mother much better, don’t you?” Father laughed and said: “You little goose, of course I do, or I should have married Aunt Dora and not Mother.” I should have liked awfully to ask Father a lot more, but I did not dare. I really do miss Dora, especially in the evenings.

July 2nd. I was in a tremendous rage at school to-day. Professor W., the traitor, did not come because he had confession and communion in the Gymnasium, and the matron did not know anything about the subject so there was no one to take his class. Then the Herr Religionsprofessor took it, he had come earlier than usual to write up the reports. But since the Jewish girls were there too, of course there was no religion lesson. But the H. Rel. Prof. had a chat with us. He asked each of us where we were going to spend the summer, and when I said I was going to Rodaun, Weinberger said: I say, *only* to Rodaun! and several of the other girls chimed in: *Only* to Rodaun; why that’s only a drive on the steam tram. I was frightfully annoyed, for we generally go to Tyrol or Styria; I said so directly, and then Franke said: Last year too, I think, you went somewhere quite close to Vienna, where was it, Hain — , and then she stopped and made as if she had never heard of Hainfeld. Of course that was all put on, but she’s very angry because we won’t speak to her since that business about the *cousin!* But now I was to learn what true friendship is. While I was getting still more angry, Hella said: Rita’s Mother is now in *Franzensbad, the world-famous health resort*; she is ill, and Prof. Sch. has to go and see her at least once a week. The Herr Rel. Prof. was awfully nice and said: Rodaun is a

lovely place. The air there is very fine and will certainly do your Mother a lot of good. That's the chief thing, isn't it children? I hope that God will spare all your parents for many years. When the Herr Rel. Prof. said that, Lampel, whose Mother died last winter, burst out crying, and I cried too, for I thought of my talk with Father. Weinberger and Franke thought I was crying because I was annoyed because we were only going to Rodaun. In the interval Franke said: After all, there's no harm in going to Rodaun, that's no reason for crying. But Hella said: "Excuse me, the Lainers can go anywhere they please, they are so well off that many people might envy them. Besides, her Mother and her sister are in Franzensbad now, where everything is frightfully expensive, and in Rodaun they have rented a house all for themselves. Rita is crying because she is anxious about her Mother, not because of anything you said." Of course we don't speak a word to Franke now. Mother does not want us to anyhow, she did not like her at all when she met her last year. Mother has a fine instinct in such matters.

July 6th. We broke up to-day. I have nothing but Very Goods, except of course in —— Natural History! That was to be expected. What —— (I can't bring myself to write the name) said was perfectly right. Nearly all the girls who were still there brought Frau Doktor M. and Frau Doktor St. flowers as farewell tokens. This time, Hella and I were allowed to go with Frau Doktor M. to the metropolitan. When we kiss her hand she always blushes, and we love doing it. This summer holidays she is going to —— — *Germany*, of course; really Hella need not have asked; it's obvious!!!

July 8th. Mother and Dora are coming home today. We are going to meet them at the station. By the way, I'd quite forgotten. The other day Father hid a new 5 crown piece in my table napkin, and when I lifted up my table napkin it fell out, and Father said: In part payment of your outlay on flowers for the table. Father is such a darling, the flowers did not cost anything like 5 crowns, 3 at most, for though they were lovely ones, I only bought fresh ones every other day. Now I shall be able to buy Mother lots of roses, and I shall either take them to the station or put them on her table. On the one hand I'm awfully glad Mother is coming home, but on the other hand I did like being alone with Father for he always talked to me about everything just as he does to Mother; that will come to an end now.

July 10th. Mother and Dora look splendid; I'm especially glad about Mother; for one can see that she is quite well again. If we had not taken the house in Rodaun, we might just as well go to Tyrol, for one can't deny it would be much nicer. Dora looks quite a stranger. It's absurd, for one can't alter in 1 month, still, she really looks quite different; she does her hair differently, parted over the ears. I have had no chance yet to say anything about the "trouble," and she has not alluded to it. In the autumn she will have to have a special exam. for the Sixth because she went away a month before the end of term. Father says that is only pro forma and that she must not take any lesson books to the country. Hella went away yesterday, she and her Mother and Lizzi are going first to Gastein and then to stay with their uncle in Hungary. Life is dull without Hella, much worse than without Dora; without her I was simply bored sometimes in the evening, at bedtime. Dora gives it out that in Franzensbad people treated her as a grown-up lady. I'm sure that's not true for anyone can see that she's a long way from being a grown-up lady yet.

July 11th. I can't think what's happened to Dora. When she goes out she goes alone. She doesn't tell me when she is going or where, and she hasn't said a word about Viktor. But he must know that she is back. To-morrow we are going to Rodaun, by train of course, not by the steam tram. The day after to-morrow, the 13th, Oswald has the viva voce exam for his matriculation. He says that in every class there are at least 1 or several *swotters*, like Verbenowitsch in ours, he says they spoil the pitch for the others, for, because of the swotters, the professors expect so much more of the others and sit upon them. This may be so in the Gymnasium, but certainly not at the High School. For though Verb. is always sucking up to the staff, they can't stand her; they give her good reports, but none of them really like her. Mother says the 13th is an unlucky day, and it makes her anxious about Oswald. Because of that she went to High Mass yesterday instead of the 9 o'clock Mass as usual. I never thought of praying for Oswald, and anyhow I think he'll get through all right.

July 13th. Thank goodness Oswald has wired he is through, that is he has wired his favourite phrase: Finis with Jubilation. At any rate that did not worry Mother as he did over the written exam., when he made silly jokes all the time. He won't be home until the 17th, for the matriculation dinner is on the 15th. Father is awfully pleased too. It's lovely here; of course we have not really got a whole house to ourselves, as Hella

pretended at school, but a flat on the first story; in the mezzanin a young married woman lives, that is to say a *newly married couple!!* Whenever I hear that phrase it makes me shake with horror and laughter combined. Resi must have thought of it too, for she looked hard at Dora and me when she told us. But they have a baby already, so they are not really a newly married couple any more. The landlord, who lives on the same floor as us, is having a swing put up for me in the garden for it is horrid not to have a swing in the country.

July 16th. At last Dora has said something to me about Viktor, but she spoke very coldly; there must be something up; she might just as well tell me; she really ought to seeing all that I've done. I have not seen him since that last letter of June 27th; that time something must have hap — no that word means something quite different, there must be something up, but I do wonder what. Hella is delighted with Gastein, she writes that the only thing wanting is *me*. I can quite understand that, for what I want here is *her*. Before the end of term Ada wrote to ask whether we were not coming to H. this year; she said she had such a frightful lot to tell me, and *she wants my advice*. I shall be very glad to advise her, but I don't know what it is about.

July 18th. Something splendid, we are —— — But no, I must write it all out in proper order. Oswald came home yesterday, he is in great form and said jokingly to Dora that she is so pretty he thinks he would fall in love with her if she were not his sister. Just before it was time to go to supper, Mother called us in, and I was rather annoyed when I saw that it was only a quarter to 8. Then Father came in with a paper in his hand as he often does when he comes back from the office, and said: "Dear Oswald and you two girls, I wanted to give you and especially Oswald a little treat because of the matriculation." Aha, I thought, the great prize after all! Then Father opened the paper and said: "You have often wondered as children why we have no title of nobility like the other Lainers. My grandfather dropped it, but I have got it back again for you Oswald, and also for you two girls. Henceforward we shall call ourselves Lanier von Lainsheim like Aunt Anna and your uncles." Oswald was simply speechless and I was the first to pull myself together and give Father a great hug. But first of all he said: "Do credit to the name." Oswald went on clearing his throat for a frightfully long time, and then he said: Thank you, Father, I shall always hold the name in trust, and then they kissed one

another. We were on our best behaviour all through the evening, although Mother had ordered roast chicken and Father had provided a bottle of champagne. I am frightfully happy; it's so splendid and noble. Think of what the girls will say, and the staff! I'm frantically delighted. To-morrow I must write and tell Hella all about it.

July 19th. I've managed it beautifully. I did not want to write just: We are now noble, so I put it all in the signature, simply writing Always your loving friend Rita Lainer von Lainsheim. I told Resi about it first thing this morning, but Father scolded me about that at dinner time and said it was quite unnecessary; it seems the nobility has gone to your head. Nothing of the sort, but it's natural that I should be frightfully glad and Dora too has covered a whole sheet of paper writing her new name. Father says it does not really make us any different from what we were before, but that is not true, for if it were he would not have bothered to revive the title. He says it will make it easier for Oswald to get on, but I'm sure there's more in it than that. Resi told the landlord about it and in the afternoon he and his wife called to congratulate us.

July 20th. Oswald says he won't stay here, it's much too dull, he is going for a walking tour through the Alps, to Grossglockner, and then to the Karawanken. He will talk of Father as the "Old Man," and I do think it is so vulgar. Dora says it is absolutely *flippant*.

July 24th. Hella's answer came to-day; she congratulates me most heartily, and then goes on to write that at first she was struck dumb and thought I'd gone crazy or was trying to take her in. But her mother had already heard of it from her father for it had been published in the Official Gazette. Now we are both noble, and that is awfully nice. For I have often been annoyed that she was noble when I was not.

July 25th. Oswald left to-day. Father gave him 300 crowns for his walking tour, because of the matriculation. I said: "In that case I shall matriculate as soon as I can" and Oswald said: "For that one wants rather more brains in one's head than you girls have." What cheek, Frau Doktor M. passed the Gymnasium matriculation and Frau Doktor Steiner passed it too as an extra. Dora said quietly: Maybe I shall show you that your sister can matriculate too; anyhow you have always said yourself that the chief thing you need to get through the matriculation is cheek. Then I had a splendid idea and said: "But we girls have not got cheek, we *study* when we have to pass an examination!" Mother wanted us to make it up with

him, but we would not. In the evening Dora said to me: Oswald is frantically arrogant, though he has had such a lot of Satisfactories and has only just scraped through his exam. By the way here's another sample of Oswald's stupidity; directly after the wire: "Finis with Jubilation" came another which ought to have arrived first, for it had been handed in 4 hours earlier, with nothing but the word "Through" [Durch]. Mother was frightfully upset by it for she was afraid it really meant *failed* [durchgefallen], and that the other telegram had been only an idiotic joke. Dora and I would never condescend to such horseplay. Father always says Oswald will sow all his wild oats at the university, but he said to-day that he was not going to the university, but would study mining, and then perhaps law.

July 29th. It's sickeningly dull here, I simply don't know what to do; I really can't read and swing the whole day long, and Dora has become as dull as she used to be; that is, even duller, for not only does she not quarrel, but she won't talk, that is she won't talk about *certain things*. She is perfectly crazy about the baby of the young couple in the mezzanin; he's 10 months old, and I can't see what she sees to please her in such a little pig; she's always carrying him about and yesterday he made her all wet, I wished her joy of it. It made her pretty sick, and I hope it will cure her infatuation.

Thank goodness to-morrow is my birthday, that will be a bit of a change. To-morrow we are going to the Parapluie Berg, but I hope we shan't want our umbrellas. Father is coming back at 1 so that we can get away at 2 or half past. Hella has sent me to-day a lock-up box for letters, etc.!!! of course filled with sweets and a tremendously long letter to tell me how *she* is getting on in Gastein. But they are only going to stay a month because it is frantically expensive, a roll 5 krenzer and a bottle of beer 1 crown. And the rolls are so small that one simply has to eat 3 for breakfast and for afternoon tea. But it's awfully smart in the hotel, several grooms; then there are masses of Americans and English and even a consul's family from Sydney in Australia. — I spend most of the day playing with two dachshund puppies. They are called Max and Moritz, though of course one of them is a bitch. That is really a word which one ought not to write, for it means something, at least in its other meaning.

THIRD YEAR, AGE THIRTEEN TO FOURTEEN

THIRD YEAR

July 31st. Yesterday was my birthday, the thirteenth. Mother gave me a clock with a luminous dial which I wanted for my night-table. Of course that is chiefly of use during the long winter nights; embroidered collars; from Father, A Bad Boy's Diary, which one of the nurses lent Hella when she was in hospital; it's such a delightfully funny book, but Father says it's stupid because no boy could have written all that, a new racquet with a leather case, an awfully fine one, a Sirk, and tennis balls from Dora. Correspondence cards, blue-grey with silver edge. Grandfather and Grandmother sent a basket of cherries, red ones, and a basket of currants and strawberries; the strawberries are only for me for my birthday. Aunt Dora sent three neckties from Berlin for winter blouses. In the afternoon we went to the Par.-Berg. It would have been awfully jolly if only Mother could have gone too or if Hella had been there.

August 1st. I got a letter from Ada to-day. She sends me many happy returns, for she thinks it is on the 1st of August, and then comes the chief thing. She is frightfully unhappy. She writes that she wants to escape from the cramping environment of her family, she simply can't endure *the stifling atmosphere of home*. She has been to St. P. to see the actor for whom she has such an admiration, he heard her recite something and said she had real dramatic talent; he would be willing to train her for the stage, but only with her parents' consent. But of course they will never give it. She writes that this has made her *so nervous* she feels like crying or raving all day long, in fact she can't stand so dismal a life any longer. *I* am her last hope. She would like me to come to stay with them, or still better if she could come and stay with us for two or 3 weeks, then she would tell Mother about everything, and perhaps it might be possible to arrange for her to live with us in Vienna for a year; in the autumn Herr G., the actor, is coming to the Raimund Theatre and she could begin her training there. At the end of her letter she says that it rests with my discretion and my tact to make her the happiest creature in the world! I don't really know what I shall be able to do. Still, I've made a beginning; I said I found it so frightfully dull — if only Hella were here, or at least Ada, or even Marina. Then Mother said: But Marina is away in the country, in Carinthia, and it's

not likely that Ada will be able to come. Father, too, is awfully sorry that I find it so dull, and so at supper he said: Would you really like Ada to come here? Certainly her age makes her a better companion for you than Dora. You seemed to get on better together last year. And then he said to Mother: Do you think it would bother you, Berta, to have Ada here? and Mother said, “Not a bit; if Gretel would like it; it’s really her turn now, Dora came with me to Franzensbad, Oswald is having his walking tour, and only our little pet has not had anything for herself; would you like it Gretel?” “Oh yes, Mother, I should like it awfully, I’ll write directly; it’s no fun to me to carry about that little brat the way Dora does, and jolly as the Bad Boy’s Diary is I can’t read it all day.” So I am writing to Ada directly, just as if *I* had thought of it and wanted her to come. I shall be so frightfully happy if it all comes off and if Ada really becomes a great actress, like Wolter whom Mother is always talking of, then I shall have done something towards helping Vienna to have a great actress and towards making Ada the happiest creature in the world instead of the unhappiest.

August 2nd. In my letter I did not say anything to Ada about our having been ennobled, or as Dora says *re-ennobled*, since the family has been noble for generations; she will find out about it soon enough when she comes here. Mother keeps on saying: Don’t put on such airs, especially about a thing which we have not done anything particular to deserve. But that’s not quite fair, for unless Father had done such splendid service in connection with the laws or the constitution or something two years ago, sometimes sitting up writing all night, perhaps he would never have been re-ennobled. Besides, I really can’t see why Father and Mother should have made such a secret about it last winter. They might just as well have let us know. But I suppose Father wanted to give us a real surprise. And he did too; Dora’s face and the way Oswald cleared his throat!! As far as I can make out no one seems to have noticed what sort of a face I was making.

August 3rd. I’ve found out now why Dora is so different, that is why she is again just as she was some time ago, before last winter. During the 4 weeks in Fr. she has *found a real friend in Mother!* To-day I turned the conversation to Viktor, and all she said at first was: Oh, I don’t correspond with him any more. And when I asked: “Have you had a quarrel, and whose fault was it?” she said: “Oh, no, I just *bade him farewell*.” “What do you mean, bade him farewell; but he’s not really going to America, is he?”

And then she said: “My dear *Rita*, we had better clear this matter up; I parted from him upon the well-justified wish of our *dear Mother*.” I must say that though I’m *awfully, awfully* fond of Mother, I really can’t imagine having her as a *friend*. How can one have a true friendship with one’s own mother? Dora really can’t have the least idea *what* a *true friendship* means. There are some things it’s impossible for a girl to speak about to her mother, I could not possibly ask her: Do you know what, *something has happened*, really means? Besides, I’m not quite sure if she does know, for when she was 13 or 15 or 16, people may have used quite different expressions, and the modern phrases very likely did not then mean what they mean now. And what sort of a friendship is it when Mother says to Dora: You must not go out now, the storm may break at any moment, and just the other evening: Dora you *must* take your shawl with you. Friendship between mother and daughter is just as impossible as friendship between father and son. For between friends there can be no orders and forbiddings, and what’s even more important is that one really can’t talk about all the things that one would like to talk of. All I said last night was: “Of course Mother has forbidden you to talk to me about *certain things*; do you call that a friendship?” Then she said very gently: “No, Rita, Mother has not forbidden me, but I recognise now that it was thoughtless of me to talk to you about those things; one learns the seriousness of life quite soon enough.” I burst out laughing and said: “Is *that* what you call the seriousness of life? Have you really forgotten how screamingly funny we found it all? It seemed to me that your memory has been affected by the mud baths.” She did not answer that. I do hope Ada will come. For *I* need *her* now just as much as *she* needs *me*.

August 4th. Glory be to God, Ada’s coming, but not directly because they begin their family washing on the 5th and no one can be spared to come over with her till the 8th. I am so glad, the only thing I’m sorry about is that *she* will sleep in the dressing-room and not Dora. But Mother says that Dora and I must stay together and that Ada can leave the door into the dining-room open so that she won’t feel lonely.

August 7th. The days are so frightfully long. Dora is as mild and gentle as a nun, but she talks to me just as little as a nun, and she’s eternally with Mother. The two dachshunds have been sold to some one in Neulengbach and so it is so horribly dull. Thank goodness Ada is coming to-morrow. Father and I are going to meet her at the station at 6.

August 8th. Only time for a word or two. Ada is more than a head taller than I am; Father said: “Hullo you longshanks, how you have shot up. I suppose I must treat you as a grown-up young lady now? And Ada said: Please, Herr Oberlandesgerichtsrat; please treat me just as you used to; I am so happy to have come to stay with you.” And her mother said: “Yes, unfortunately she is happy anywhere but at home; *that is the way with young people to-day*.” Father helped Ada out and said: “Frau Haslinger, the sap of life was rising in us once, but it’s so long ago that we have forgotten.” And then Frau Dr. H. heaved a tremendous sigh as if she were suffocating, and Ada took me by the arm and said under her breath: “Can you imagine what my life is like *now*? Her mother is staying the night here, and she spent the whole evening lamenting about everything under the sun” (that’s what Ada told me just before we went to bed); but I did not pay much attention to what Frau H. was doing, for I’m positively burning with curiosity as to what Ada is going to talk to me about. To-morrow morning, directly after breakfast!

August 12th. For 3 days I’ve had no time to write, Ada and I have had such a lot to say to one another. She *can’t* and *won’t* live any longer without art, she would *rather die than give up her plans*. She still has to spend a year at a continuation school and must then either take the French course for the state examination or else the needlecraft course. But she wants to do all this in Vienna, so that in her spare time she can study for the stage under Herr G. She says she is not in love with him any longer, that he is only a *means to an end*. She would sacrifice *anything* to reach her goal. At first I did not understand what she meant by anything, but she explained to me. She has read Bartsch’s novel Elisabeth Kott, the book Mother has too, and a lot of other novels about artistic life, and they all say the same thing, that *a woman cannot become a true artist until she has experienced a great love*. There may be something in it. For certainly a *great love* does make one *different*; I saw that clearly in Dora; when she was madly in love with Viktor, and the way she’s relapsed now!! She is learning Latin again, to make up for lost time! Ada does not speak to her about her plans because Dora *lacks true insight!* Only to-day she mentioned before Dora that whatever happened she wanted to come to Vienna in the autumn so that she could often go to the theatre. And Dora said: You are making a mistake, even people who live in Vienna don’t go to the theatre often; for first of all one has very little time to spare, and

secondly one often can't get a seat; people who live in the country often fancy that everything is much nicer in Vienna than it really is.

August 14th. Just a word, quickly. To-day when Ada was having a bath Mother said to *us two*: "Girls, I've something to tell you; I don't want you to get a fright in the night. Ada's mother told me that Ada is very nervous, and often walks in her sleep." "I say," said I, "that's frightfully interesting, she must be *moonstruck*; I suppose it always happens when the moon is full." Then Mother said: "Tell me, Gretel, how do you know about all these things? Has Ada talked to you about them?" "No," said I, "but the Frankes had a maid who walked in her sleep and Berta Franke told Hella and me about it." It has just struck me that Mother said: how do you know about all *these* things? So it must have something to do with *that*. I wonder whether I dare ask Ada, or whether she would be offended. I'm frightfully curious to see whether she will walk in her sleep while she is staying here.

August 15th. Hella's answer came to-day to what I had written her about the *friendship* between Mother and Dora. Of course she does not believe either that *that* is why Dora *bade farewell* to Viktor, for it is no reason at all. Lizzi has never had any particular friendship with her mother, and Hella could never dream of anything of the sort; she thinks I'm perfectly right, one may be *awfully* fond of one's parents, but there simply can't be any question of a friendship. She would not stand it if I were so changeable in my friendships. She thinks Dora can never have had a true friendship, and that is why she has taken up with Mother now. The Bruckners are coming back on the 19th because everything is so frightfully expensive in Gastein. After that most likely they will go to stay with their uncle in Hungary, or else to Fieberbrunn in Tyrol. For Hella's name day I have sent her A Bad Boy's Diary because she wanted to read it again. Now we have both got it, and can write to one another which are the best bits so that we can read them at the same time.

August 20th. *Last night Ada really did walk in her sleep,* probably we should never have noticed it, but she began to recite Joan of Arc's speech from The Maid of Orleans, and Dora recognised it at once and said: "I say, *Rita,* Ada really is walking in her sleep." We did not stir, and she went into the dining-room, but the dining-room door was locked and the key taken away, for it opens directly into the passage, and then she knocked up against Mother's sofa and that woke her up. It was horrible. And then she lost her way and came into our room instead of going into her own; but she

was already awake and begged our pardon and said she'd been looking for the W. Then she went back to her own room. Dora said we had better pretend that we had not noticed it, for otherwise we should upset Ada. Not a bit of it, after breakfast she said: "I suppose I gave you an awful fright last night; don't be vexed with me, I often get up and walk about at night, I simply can't stay in bed. Mother says I always recite when I am walking like that; do I? Did I say anything?" "Yes," I said, "you recited Joan of Arc's speech." "Did I really," said she, "that is because they won't let me go on the stage; I'm certain I shall go off my head; if I do, you will know the real reason at any rate." This sleep-walking is certainly very interesting, but it makes me feel a little creepy towards Ada, and it's perfectly true what Dora has always said: One never knows what Ada is really looking at. It would be awful if she were really to go off her head. I've just remembered that her mother was once in an asylum. I do hope she won't go mad while she is staying here.

August 21st. Mother heard it too the night before last. She is so glad that she had warned us, and Dora says that if she had not known it beforehand she would probably have had an attack of palpitation. Father said: "Ada is thoroughly histerical, she has inherited it from her mother." In the autumn Lizzi is going to England to finish her education and will stay there a whole year. Fond as I am of Ada and sorry as I am for her, she makes me feel uneasy now, and I'm really glad that she's going home again on Tuesday. She told me something terrible to-day: Alexander, he is the actor, has *venereal disease*, because he was once an officer in the army; she says that all officers have venereal disease, as a matter of course. At first I did not want to show that I did not understand exactly what she meant, but then I asked her and Ada told me that what was really amiss was that *that* part of the body either gets continually smaller and smaller and is quite eaten away, or else gets continually larger because it is so frightfully swollen; the last kind is much better than the other, for then an operation can help; a retired colonel who lives in H. was operated upon in Vienna for *this*; but it did not cure him. There is only one real cure for a man with a venereal disease, that a young girl should *give herself* to a man suffering from it! (Mad. often said that too), then she gets the disease and he is cured. That made Ada understand that she did not really love A., but only wanted him to train her; for she could never have done that for him, and she did not know how she could propose *that* to him even *if* she had

been willing to. Besides, it is generally the man concerned who asks it of the girl. And when I said: “But just imagine, what would you do if you got a baby that way,” and she said: “That does not come into the question, for when a man has venereal disease it is *impossible* to have a child by him. But after all, only a woman who has had a baby can become a true artist.” Franke, who has a cousin on the stage said something of the same sort to Hella and me; but we thought, Franke’s cousin is only in the Wiener Theatre, and that might be true there; but it may be quite different in the Burg Theatre and in the Opera and even in the People’s Theatre. I told Ada about this, and she said: Oh, well, I’m only a girl from the provinces, but I have known for ages that *every* actress has a child.

23rd. Ada really is a born artist, to-day she read us a passage from a splendid novel, but oh, how wonderfully, even Dora said: “Ada, you are really phenominal!” Then she flung the book away and wept and sobbed frightfully and said: “My parents are sinning against their own flesh and blood; but they will rue it. Do you remember what the old gypsy woman foretold of me last year: ‘A *great* but *short* career after many difficult struggles; and my line of life is broken!’ That will all happen as predicted, and my mother can recite that lovely poem of Freiligrath’s or Anastasius Grun’s, or whosever it is ‘Love as long as thou canst, love as long as thou mayst. The hour draws on, the hour draws on, when thou shalt stand beside the grave and make thy moan.’” Then Ada recited the whole poem, and when I went to bed I kept on thinking of it and could not go to sleep.

August 24th. To-day I ventured to ask Ada about the sleep-walking, and she said that it was really so, when she walked in her sleep it was always at *that time* and when the moon is full. The first time, it was last year, she did it on purpose in order to frighten her mother, when her mother had first told her she would not be allowed to go on the stage. It does not seem to me a very clever idea, or that she is likely to gain anything by it. The day after to-morrow someone is coming to fetch her home, and for that reason she was crying all the morning.

August 25th. Hella was here to-day with her mother and Lizzi. Hella had a splendid time in Gastein. She wanted to have a private talk with me, to tell me something important. That made it rather inconvenient that Ada was still there. Hella never gets on with Ada, and she says too that one never really knows what she is looking at, she always looks right through one. We could not get a *single minute* alone together for a talk. I do hope

Hella will be able to come over once more before she goes to Hungary. Last week they went to Fieberbrunn in Tyrol because an old friend of her mother's from Berlin is staying there.

August 26th. Ada went home to-day, her father came to fetch her. He says she has a screw loose, because she wants to go on the stage.

August 28th. Hella came over to-day; she was alone and I met her at the steam tram. At first she did not want to tell me what the important thing was because it was *not flattering* to me, but at last she got it out. The Warths were in Gastein, and since Hella knows Lisel because they used to go to gym. together, they had a talk, and that cheeky Robert said: Is your friend still such a baby as she was that time in er . . . er . . ., and then he pretended he could not remember where it was; and he spoke of *that time* as if it had been 10 years ago. But the most impudent thing of all was this; he said that I had not wanted to call him Bob, because that always made me think of a certain part of the body; I never said anything of the kind, but only that I thought Bob silly and vulgar, and then he said (it was before we got intimate): "Indeed, Fraulein Grete, I really prefer that you should use my full name." I remember it as well as if it had happened this morning, and I know exactly where he said it, on the way to the Red Cross. Hella took him up sharply: That may be all quite true, we have never discussed such trifles, and, at that time we were "all, *every one of us*, still nothing but children." Of course she meant to include —— . I won't even write his name. Another thing that made me frightfully angry is that he said: I dare say your friend is more like you now, but at that time she was still quite undeveloped. Hella answered him curtly: "That's not the sort of phrase that it's seemly to use to a young lady," and she would not speak to him any more. I never heard of such a thing, what business is it of his whether I am *developed* or not! Hella thinks that I was not quite particular enough in my choice of companions. She says that Bob is still nothing but a Bub [young cub]. That suits him perfectly, Bob — Bub; now we shall never call him anything but Bub; that is if we ever speak of him at all. When we don't like some one we shall call him simply Bob, or better still B., for we really find it disagreeable to say Bob.

August 31st. The holidays are so dull this year, Hella has gone to Hungary, and I hardly ever talk to Dora, at least about anything *interesting*. Ada's letters are full of nothing but my promises about Vienna. It's really too absurd, I never promised anything, I merely said I would speak to

Mother about it when I had a chance. I have done so already, but Mother said: There can be no question of anything of the kind.

September 1st. Hullo, Hurrah! To-morrow Hella's father is going to take me to K — M — in Hungary to stay with Hella. I am so awfully delighted. Hella is an angel. When she was ill last Christmas her father said: She can ask for anything she likes. But she did not think of anything in particular, and had her Christmas wishes anyhow, so she saved up this wish. And after she had been here she wrote to her father in Cracow, where he is at manoeuvres, saying that if he would like to grant her her chief wish, then, when he came back to Vienna, he was to take me with him to K — M — ; this was really the *greatest wish* she had ever had in her life! So Colonel Bruckner called at Father's office to-day and showed him Hella's letter. To-morrow at 3 I must be at the State Railway terminus. Unfortunately that's a horrid railway. The Western Railway is much nicer, and I like the Southern Railway better still.

September 2nd. I am awfully excited; I'm going to Vienna alone and I have to change at Liesing, I do hope I shall get into the right train. I got a letter from Hella first thing this morning, in which she wrote: "Perhaps we shall be together again in a few days." That's all she said about that; I suppose she did not know yet whether I was really coming. Mother will have to send my white blouses after me, because all but one are dirty. I'm going to wear my coat and skirt and the pink blouse. I'm going to take twenty pages for my diary, that will be enough; for I'm going to write whatever happens, in the mornings I expect, because in the holidays I'm sure Hella will never get up before 9; on Sundays in Vienna she would always like to lie in bed late, but her father won't let her.

But whatever happens I won't learn to ride, for it must be awful to tumble off before a strange man. It was different for Hella, for Jeno, Lajos, and Erno are her cousins, and one of them always rode close beside her with his arm round her waist: but that would not quite do in my case.

September 6th. Oh it is so glorious here. I like Jeno best, he goes about with me everywhere and shows me everything; Hella is fondest of Lajos and of Erno next. But Erno has still a great deal to learn, for he was nearly flunked in his exam. Next year Lajos will be a lieutenant, and this autumn Jeno is going to the military academy, Erno has a slight limp, nothing bad, but he can't go into the army; he is going to be a civil engineer, not here, he is to go to America some day.

I have time to write to-day, for all 4 of them have gone to S. on their cycles and I have never learned.

It was lovely on the journey! It's so splendid to travel with an officer, and still more when he is a colonel. All the stationmasters saluted him and the guards could not do enough to show their respect. Of course everyone thought I was his daughter, for he has always said "Du" to me since I was quite a little girl. But to Ada Father always says "Sie." We left the train at Forgacs or Farkas, or whatever it is called, and Hella's father hired a carriage and it took us 2 hours to drive to K — M — . He was awfully jolly. We had our supper in F., though it was only half past 6. It was a joke to see all the waiters tumbling over each other to serve him. It s just the same with Father, except that the stationmasters don't all salute. Father looks frightfully distinguished too, but he is not in uniform.

Here is something awfully interesting: Herr von Kraics came yesterday from Radufalva, his best friend left him the Radufalva estate out of gratitude, because 8 years ago he gave up his fiancee with whom the friend was in love. It's true, Colonel Bruckner says that K. is a wretched milksop; but I don't think so at all; he has such fiery eyes, and looks a real Hungarian nobleman. Hella says that he used to run himself frantically into debt, because every six months he had an *intimacy* with some new woman; and all the presents he gave *reduced him almost to beggary*. Still, it's difficult to believe that, for however fond a woman may be of flowers and sweets, one does not quite see why that should reduce anyone to beggary. Before we went to sleep last night Hella told me that Lajos had already been "infected" more or less; she says there is not an officer who has not got venereal disease and that is really what makes them so frightfully interesting. Then I told her what Ada had told me about the actor in St. P. But Hella said: I doubt if that's all true; of course it is more likely since he was an actor, and especially since he was in the army at one time, but generally speaking civilians are *wonderfully* healthy!!! And she could not stand that in her husband. Every officer has *lived* frantically; that's a polite phrase for having had venereal disease, and she would never marry a man who had not *lived*. Most girls, especially when they get a little older; want the very opposite! and then it suddenly occurred to me that *that* was probably the *real* reason why Dora *bade farewell* to *Lieutenant R.*, and not the *friendship with Mother*; it is really awfully funny, and no one would have thought it of her. Hella's father thinks me

charming; he is really awfully nice. Hella's uncle hardly ever says anything, and when he does speak he is difficult to understand; Hella's father says that his sister-in-law wears the breeches. That would never do for me; the man must be the *master*. "But not too much so" says Hella. She always gets cross when her father says that about wearing breeches. I got an awful start yesterday; we went out on the veranda because we heard the boys talking, and found Hella's great uncle lying there on an invalid couch. She told me about him once, that he's quite off his head, not really paralysed but only pretends to be. Hella is terribly afraid of him, because long ago, when she was only 9 or 10 years old, he wanted to give her a thrashing. But her uncle came in, and then he let her go. She says he was only humbugging, but she is awfully afraid of him all the same. He keeps his room, and he has a male attendant, because no nurse can manage him. He ought really to be in an asylum but there is no high class asylum in Hungary.

September 9th. There was a frightful rumpus this morning; the great uncle, the people here call him "kutya mog" or however they spell it, and it means *mad dog*, well, the great uncle *spied in on us*. He can walk with a stick, our room is on the ground floor, and he came and planted himself in front of the window when Hella was washing and I was just getting out of bed. Then Hella's father came and made a tremendous row and the uncle swore horribly in Hungarian. Before dinner we overheard Hella's father say to Aunt Olga: "They would be dainty morsels for that old swine, those innocent children." We did laugh so, *we* and *innocent children!!!* What our fathers really think of us; we innocent!!! At dinner we did not dare look at one another or we should have exploded. Afterwards Hella said to me: "I say, do you know that we have the same name day?" And when I said: "What do you mean, it seems to me you must have gone dotty this morning," she laughed like anything and said: "Don't you see, December 27th, Holy Innocents' Day!" Oh it did tickle me. She knew that date although she's a Protestant because December 27th is Marina's birthday, and in our letters we used to speak of that deceitful cat as "The Innocent."

The three boys and I have begun to use "Du" to one another, at supper yesterday Hella's father said to Erno: "You seem frightfully ceremonious still, can't you make up your minds to drop the 'Sie?'" So we clinked glasses, and afterwards when Jeno and I were standing at the window admiring the moon, he said: "You Margot, that was not a real pledge of

good-fellowship, we must kiss one another for that; hurry up, before anyone comes," and before I could say No he had given me a kiss. After all it was all right as it was Jeno, but it would not have done with Lajos, for it would have been horrid because of Hella, or Ilonka as they call her here.

Hella has just told me that they saw us kissing one another, and Lajos said: "Look Ilonka, they are setting us a good example." We are so awfully happy here. It's such a pity that on the 16th Jeno and Lajos have got to leave for the Academy, where Jeno is to enter and Lajos is in his third year: Erno, the least interesting of the three, is staying till October. But that is always the way of life, beautiful things pass and the dull ones remain. We go out boating every day, yesterday and to-day by moonlight. The boys make the boat rock so frightfully that we are always terrified that it will upset. And then they say: "You have your fate in your own hands; buy your freedom and you will be as safe as in Abraham's bosom."

September 12th. The great uncle *hates us* since what happened the other day; whenever he sees us he threatens us with his stick, and though we are not really afraid, because he can't do anything to us, still it's rather creepy. One thinks of all sorts of things, stories and sagas one has read. That is the only thing I don't quite like here. But we are leaving on the 18th. Of course Lajos and Jeno will often come to see the Bruckners; I'm awfully glad. I don't know why, I always fancied that they could only speak Magyar; but that is not so at all, though they always speak it at home when they are alone. Hella told me to-day for the first time that all the flowers on the table by her bed one Sunday in hospital had been sent by Lajos; and she did not wish to tell me at that time because he wished her to keep it a secret. This has made me rather angry, for I see that I have been much franker with her than she has been with me.

September 16th. The boys left to-day, and we stayed up till midnight last night. We had been to N — K — , I don't know how to spell these Hungarian names, and we did not get back till half past 11. It was lovely. But it seems all the sadder to-day, especially as it is raining as well. It's the first time it's rained since I came. Partings are horrid, especially for the ones left behind; the others are going to new scenes anyhow. But for the people left behind everything is hatefully dull and quiet. In the afternoon Hella and I went into Jeno's and Lajos' room, it had not been tidied up yet and was in a frightful mess. Then Hella suddenly began

sobbing violently, and she flung herself on Lajos' bed and kissed the pillow. *That* is how she loves him! I'm sure *that* is the way Mad. loves the lieutenant, but Dora is simply incapable of *such* love, and then she can talk of her *true and intimate friendship with Mother*. Hella says she has always been in love with Lajos, but that *her eyes were first opened* when she saw Jeno and me going about together and talking to one another. Now she will love Lajos for evermore. Next year they will probably get engaged, she can't be engaged till she is 14 for her parents would not allow it. It is for her sake that he is going into the Hussars because she likes the Hussars best. They all *live frightfully hard*, and are tremendously smart.

September 21st. Since Saturday we have been back In Vienna, and Father, Mother, and Dora came back from Rodaun on Thursday. Dora really is too funny; since Ada stayed with us and walked in her sleep Dora is afraid she has been *infected*. She does not seem to know what the word really means! And while I was away she slept with Mother, and Father slept in our room, because she was afraid to sleep alone. Of course no one takes to walking in their sleep simply from sleeping alone, but that was only a pretext; Dora has never been very courageous, in fact she is rather a coward, and she was simply afraid to sleep alone. If Father had been afraid too, I suppose I should have had to come back post-haste, and if I had been afraid to travel alone, and there had been no one to come with me, that would have been a pretty state of affairs. I told them so. Father laughed like anything at my "*combinations*," and Dora got in a frightful wax. She is just as stupid and conceited as she was *before* she fell in love. So Hella is right when she says: Love enobles [veredelt]. Erno made a rotten joke about that when he heard Hella say it once. He said: "You've made a slip of the tongue, you meant to say: Love makes fools of people [vereselt]." Of course that's because he's not in love with anyone.

September 22nd. School began again to-day. Frau Doktor M. is perfectly fascinating, she looks splendid and she said the same to both of us. Thank goodness she's the head of our class again. In French we have a new mistress Frau Doktor Dunker, she is perfectly hideous, covered with pimples, a thing I simply can't stand in any one; Hella says we must be careful never to let her handle our books; if she does we might catch them. In Maths and Physics we have another new mistress, she is a Doktor too, and she speaks so fast that none of us can understand her; but she looks frightfully clever, although she is very small. We call her "*Nutling*"

because she has such a tiny little head and such lovely light-brown eyes. Otherwise the staff is the same as last year, and there are a few new girls and some have left, but only ones we did not know intimately. This is Franke's last year at the Lyz., she will be 16 in April and has a splendid figure. Her worst enemy must admit that. Dora is having English lessons from the matron, and she is *awfully pleased* about it, for she is one of her favourites and it will help her too in her matriculation.

September 25th. Yesterday and the day before Mother was so ill that the doctor had to be sent for at half past 10 at night. Thank goodness she is better now. But on such days I simply can't write a word in my diary; I feel as if I oughtn't to. And the days seem everlasting, for nobody talks much, and it's awful at mealtimes. Mother was up again to-day, lying on the sofa.

September 29th. I've had such an awful toothache since the day before yesterday. Dora says it's only an ache for a gold filling like Frau Doktor M.'s. Of course that's absurd; for first of all, surely I ought to know whether my own tooth hurts or not, and secondly the dentist says that the tooth really is decayed. I have to go every other day and I can't say I enjoy it. At the same time, this year we have such a frightful lot to learn at school. The Nutling is really very nice, if one could only understand better what she says, but she talks at such a rate that in the Fifth, where she teaches too, they call her Waterfall. Nobody has ever given Frau Doktor M. a nickname, not even an endearing one. The only one that could possibly be given to her is Angel, and that could not be a real name, it's quite unmeaning. In the drawing class we are going to draw from still life, and, best of all, animal studies too, I am so delighted.

October 4th. Goodness, to-day when we were coming home from the Imperial Festival, we met Viktor in M. Street, but unfortunately he did not see us. He was in full-dress uniform and was walking with 3 other officers whom neither I nor Hella know. We were frightfully angry because he did not recognise us; Hella thinks it can only be because we were both wearing our big new autumn hats, which shade our faces very much.

October 11th. There was a frightful row in the drawing lesson to-day. Borovsky had written a note to one of her friends: "The little Jewess, F. (that means the Nutling) is newly imported from Scandalavia with her horsehair pate with or without inhabitants." Something of that sort was what she had written and as she was throwing it across to Fellner, Fraulein

Scholl turned round at that very moment and seized the note. “Who is F.?”, she asked, but no one answered. That made her furious and she put the note in her pocket. At 1 o’clock, when the lesson was over, Borovsky went up to her and asked her for the note. Then she asked once more: “Who is F.?” And Fellner, thinking I suppose that she would help Borovsky out, said: “She forgot to write Frau Doktor Fuchs.” Then the row began. I can’t write it all down, it would take too long; of course Borovsky will be expelled. She cried like anything and begged and prayed, and said she did not mean it, but Fraulein Scholl says she is going to give the letter to the head.

October 12th. Continuation; the head is laid up with a chill, so Frl. Scholl gave the note to Frau Doktor M.; that was both good and bad. Good because Borovsky will perhaps be able to stay after all, and bad because Frau Doktor M. was frightfully angry. She gave us a fine lecture about True Good Manners, simply splendid. I was so glad that I was not mixed up in the business, for she did give Borovsky and Fellner a rating. It’s probably true, then, that her own fiance is a Jew. Its horrible that *she* above all should be going to have a cruel husband; at least if all that Resi told us is true; and I expect there is some truth in it. We are frightfully curious to know whether the Nutling has heard anything about it and if so what she will do.

October 13th. I don’t think the Nutling can have heard anything for she seemed just as usual; but Hella thinks and so do I that she would not show anything even if Frl. Scholl had told her; anyhow it was horridly vulgar; one is not likely to pass it on to the person concerned. Why we think she does not know anything is that neither Borovsky nor Fellner were called up.

October 14th. To-day the needlewoman brought Dora’s handkerchiefs with her monogram and the coronet, lovely; I want some like them for Christmas. And for Mother she has embroidered six pillow-cases, these have a coronet too; by degrees we shall have the coronet upon everything. By the way, here is something I’d forgotten to write: In one of the first days of term Father gave each of us one of his new visiting cards with the new title, I was to give mine to Frau Doktor M. and Dora hers to Frau Prof. Kreidl, to have the names properly entered in the class lists. Frau Prof. Kreidl did not say anything, but Frau Doktor M. was awfully sweet. She said: “Well, Lainer, I suppose you are greatly pleased at this rise in rank?”

And I said: “Oh yes, I’m awfully delighted, but only inside,” then she said: That’s right; “Religion, name, and money do not make the man.” Was not that charming! I write the v before my name awfully small; but anyone who knows can see it. What a shame that she is not noble! *She* would be worthy of it!!

October 15th. Oswald has gone to Leoben to-day, he is to study mining, but *against* Father’s will. But Father says that no one must be forced into a profession, for if he is he will always say throughout life that he only became this or that on compulsion. The other evening Dora said that Oswald had only chosen mining in order to get away from home; if he were to study law or agricultural chemistry he could not get away from Vienna, and that is the chief thing to him. Besides, he is a bit of a humbug; for when he came home from Graz after matriculation he said in so many words: “How delightful to have one’s legs under one’s own table again and to breathe the *family atmosphere*.” Dora promptly said to him: “Hm, you don’t seem to care so very much about home, for always when you come home for the holidays the first thing you do is to make plans for getting away.” For she is annoyed too that Oswald can travel about wherever he likes. And yet he goes on talking about being “*subjected to intolerable supervision”!!* What about us? He can stay out until 10 at night and *never* comes to afternoon tea, and in fact does just what he likes. If I go to supper with Hella and am just ever so little late, there’s a fine row. As for the lectures poor Dora had to endure when Viktor was waiting for her, I shall never forget them. Of course she denies it all now, but I was present at some of them so I know; otherwise he would not have called me “the Guardian Angel.” She behaves now as if she had forgotten all about that, so I often remind her of it on purpose when we are alone together. The other day she said: “I do beg you, Grete (not Rita), don’t speak any more of that matter; I have buried the affair for ever.” And when I said: “Buried, what do you mean? A true love can’t simply be *buried* like that,” she said: “It was not a true love, and that’s all there is to say about it.”

October 16th. I had a frantically anxious time in the arithmetic lesson to-day. All of a sudden Hella flushed dark red and I thought to myself: Aha, that’s it! And I wrote to her on my black-line paper: Has it begun??? for we had agreed that she would tell me directly, she will be 14 in February and *it* will certainly begin soon. Frau Doktor F. said: Lainer, what was that you pushed over to Br.? and she came up to the desk and took the

black-line paper. “What does that mean: Has it begun???” Perhaps she really did not know what I meant, but several of the girls who knew about it too laughed, and I was in a terrible fright. But Hella was simply splendid. “Excuse me, Frau Doktor, Rita asked whether the frost had begun yet.” “And that’s the way you spend your time in the mathematics lesson?” But thank goodness that made things all right. Only in the interval Hella said that really I am inconceivably stupid sometimes. What on earth did I want to write a thing like that for? *When* it begins, *of course* she will let me know directly. As a matter of fact it has *not* begun yet. We have agreed now that it will be better to say “Endt,” a sort of portmanteau word of *developed* [entwickelt] and *at last* [endlich] . That will really be splendid and Hella says that I happened upon it in a lucid interval. It’s really rather cheeky of her, but after all one can forgive anything to one’s friend. She absolutely insists that I must never again put her in such a fix in class. Of course it happened because I am always thinking: Now then, this is the day.

November 8th. On Father’s and Dora’s birthday Mother was so ill that we did not keep it at all. I was in a terrible fright that Mother was seriously ill, or even that —— —— — No, I won’t even think it; one simply must not write it down even if one is not superstitious. Aunt Dora came last week to keep house for Mother. We are not going skating, for we are always afraid that Mother might get worse just when we are away. As soon as she is able to get up for long enough Father is going to take her to see a specialist in the *diseases of women*; so it must be true that Mother’s illness comes from *that*.

November 16th. Oh it’s horrible, Mother has to have an operation; I’m so miserable that I can’t write.

November 19th. Mother is so good and dear; she wants us to go skating to take our thoughts off the operation. But Dora says too that it would be brutal to go skating when Mother is going to have an operation in a few days. Father said to us yesterday evening: “Pull yourselves together children, set your teeth and don’t make things harder for your poor Mother.” But I can’t help it, I cry whenever I look at Mother.

November 23rd. It is so dismal at home since Mother went away; we had to go to school and we believed she would not leave until the afternoon, but the carriage came in the morning. Dora says that Father had

arranged all that because I could not control myself. Well, who could? Dora cries all day; and at school I cried a lot and so did Hella.

November 28th. Thank goodness, it's all safely over, Mother will be home again in a fortnight. I'm so happy and only now can I realise how *horribly* anxious I have been. We go every day to see Mother at the hospital; I wish I could go alone, but we always go all together, that is either with Father or with Aunt Dora. But I suspect that Dora does go to see Mother quite alone, she gave herself away to-day about the flowers, she behaves as if Mother were only *her* mother. On Thursday, the first time we saw Mother, we all whispered, and Mother cried, although the operation had made her quite well again. Unfortunately yesterday, Aunt Alma was there when we were, and Father said that seeing so many people at once was too exciting for Mother, and we must go away. Of course he really meant that Aunt Alma and Marina had better go away, but Aunt did not understand or would not. Why on earth did Aunt come? We hardly ever meet since the trouble about Marina and that jackanapes Erwin; only when there is a family party; Oswald says it's not a family gathering but a family dispersal because nearly always some one takes offence.

November 30th. To-day I managed to be *alone* with Mother. At school I said I had an awfully bad headache and asked if I might go home before the French lesson; I really had. What I told Mother was that Frau Doktor Dunker was ill, so we had no lesson. Really one ought not to tell lies to an invalid, but this was a *pious fraud* as Hella's mother always calls anything of the sort, and no one will find out, because Frau Doktor Dunker has nothing to do with the Fourth, so Dora won't hear anything about it. Mother said she was *awfully pleased* to be able to see *me* alone for once. That absolutely proves that Dora does go alone. Mother was so sweet, and Sister Klara said she was a perfect angel in goodness and patience. Then I burst out crying and Mother had to soothe me. At first, after I got home, I did not want to say anything about it, but when we were putting on our things after dinner to go and see Mother I said en passant as it were: "This is the second time I shall be seeing Mother to-day." And when Dora said: What do you mean? I said quite curtly: "One of our lessons did not come off, and so I took the chance *too* of being able to see Mother *alone*." Then she said: Did the porter let you in without any trouble? It surprises me very much that such *very* young girls, who are almost children still, are allowed to go in alone. Luckily Aunt came in at that moment and said:

“Oh well, nobody thinks Gretl quite a child now, and *both of you* can go alone to the hospital all right.” On the way we did not speak to one another.

December 5th. For St. Nicholas day we took Mother a big flower pot, and tied to the stick was a label on which Father had written; “Being ill is punishable as an unpermissible offence in the sense of Section 7 the Mothers’ and Housewives’ Act.” Mother was frightfully amused. The doctor says she is going on nicely, and that she will be able to come home in a few days.

December 6th. It was awful to-day. In the evening when we were leaving the dining-room Father said: “Gretl you have forgotten something.” And when I came back he took me by the hand and said: “Why didn’t you tell me that you want so much to see Mother *alone*? You need not make such a secret of it.” And then I burst out crying and said: “Yes, I need not keep it secret from you, but I don’t like Dora to know all about it. Did she tell you what happened the other day?” But Father does not know anything about my pretended headache, but only that I wanted so much to see Mother alone. He was awfully kind and kissed and petted me, saying: “You are a dear little thing, little witch, I hope you always will be.” But I got away as quick as I could, for I felt so ashamed because of my fibbing. If it were not for Dora I’m sure I should never tell any lies.

December 6th. Father is an angel. He and I went to see Mother in the morning, and Aunt and Dora went in the afternoon. And since Father had to go into the Cafe where he had an appointment with a friend, I went on alone to see Mother and he came in afterwards. Mother asked me about my Christmas wishes; but I told her I had only one wish, that she should get well and live for ever. I was awfully glad that Dora was not there, for I could never have got that out before her. Still, she made me tell her my wishes after all, so I said I wanted handerkerchiefs with “monogram and coronet,” visiting cards with *von*, a satchel like that which most of the girls in the *higher* classes have, and the novel Elizabeth Kott. But I am not to have the novel, for Mother was horrified and said: My darling child, that’s not the sort of book for you; who on earth put that into your head; Ada, I suppose? From what I know of your tastes, it really would not suit you at all. So I had to give that up, but I’m certain I should not find the book stupid.

December 11th. Mother came home again to-day; we did not know what time she was coming, but only that it was to be to-day. And because I was so glad that Mother is quite well again, I sang two or three songs, and Mother said: That is a good omen when one is greeted with a song. Then Dora was annoyed because *she* had not thought of singing. We had decorated the whole house with flowers.

December 15th. I am embroidering a cushion for Mother and Dora is making her a footstool so that she can sit quite comfortably when she is reading. For Father we have bought a new brief bag because his own is so shabby that it makes us quite ashamed; but he always says: “It will do for a good while yet.” For a long time I did not know what to get for Aunt Dora, and at length we have decided upon a lace fichu; for she is awfully fond of lace. I am giving Hella a sketch book and a pencil case; she draws beautifully and will perhaps become an artist, for Dora I am getting a vanity bag and for Oswald a cigarette case with a horse’s head on it, for he is frightfully taken up with racing and the turf.

December 16th. Owing to Mother’s illness I’ve had simply no time to write anything about the school, although there has been a *great deal* to write about, for example that Prof. W. is very friendly again, although he no longer gives us lessons, and that most of the girls can’t bear the Nutling because she makes such favourites of the Jewish girls. It’s quite true that she does, for example Franke, who is never any good, will probably get a Praiseworthy in Maths and Physics; and she lets Weinberger do anything she likes. I always get Excellent both for school work and prep.; so it really does not matter to me, but Berbenowitsch is frightfully put out because she is no longer the favourite as she was with Frau Doktor St. The other day it was quite unpleasant in the Maths lesson. In the answer to a sum there happened to be 1-3, and then the Nutling asked what 1-3 would be as a decimal fraction; so we went on talking about recurring [periodic] decimals and every time she used the word *period*, some of the girls giggled, but luckily some of them were Jews, and she got perfectly savage and simply screamed at us. In Frau Doktor St’s lesson in the First, some of the girls giggled at the same thing and she went on just as if she had not noticed it, but afterwards she always spoke of *periodic places*, and then one does not think of the real meaning so much. Frau Doktor F. said she should complain to Frau Doktor M. about our unseemly behaviour. But really all the girls had not giggled, for ex. Hella and I simply exchanged

glances and understood one another at once. I can't endure that idiotic giggling.

December 20th. Oswald came home to-day; he's fine. It's quite true that he has really had a moustache for a long time, but was not allowed to grow it at the Gymnasium; in boarding schools the barber comes every Saturday, and they *have* to be shaved. He always says that at the Gymnasium everything manly is simply suppressed. I am so glad I am not a man and need not go to Gymnasium. Anyhow he has a splendid moustache now. Hella did not recognise him at first and drew back in alarm, she only knew him after a moment by his voice. We have reckoned it up, and find that she has not seen him since the Easter before last. At first he called her Fraulein, but her mother said: Don't be silly. It did not seem silly to me, but most polite!!!

December 23rd. Mother is so delighted that Oswald is home again and he really is awfully nice; he is giving her a wonderful flowers-of-iron group representing a mountain scene with a forest, and in the foreground some roe deer as if in a pasture.

December 25th. Only time for a few words. Mother was very well yesterday, and it has not done her any harm to stay up so long. I am so happy. We both got a tie pin with a sapphire and 3 little diamonds, they have been made out of some earrings which Mother never wears now. But the nice thing about it is that they are made from her earrings. The satchel and Stifter's Tales are awfully nice and so are the handkerchiefs with the coronet and everything else. Hella gave me a reticule with my monogram and the coronet as well. Oswald has given Dora and me small paperweights and Father a big one, bronze groups. We really need two writing tables, but there is no room for two. So I am going to arrange the little corner table as my writing table and have all my things there.

December 27th. At the Bruckners yesterday it was really awful. Hella's mother is perfectly right; when anyone looks like *that* she ought not to pay visits when she knows that other people may be there. Hella told me the day before yesterday how frightfully noticeable it is in her cousin that she is in an i — c — ! Her mother was very much put out on her account and she wanted to prevent Emmy's standing up. We were simply disgusted and horrified. But her husband is awfully gentle with her; She is certainly not pretty and especially the puffiness under her eyes is horrid. They say that many women look like that when they are pr. She was wearing a *maternity*

dress, and that gives the whole show away! Hella says that some women look awfully pretty when they are in an i — c — , but that some look hideous. I do hope I shall be one of the first kind, if I ever . . . No, it is really horrible, even if it makes one pretty; when I think of Frau von Baldner and what she looked like last summer, yet Father has always said she is a a perfect beauty. Really no one is pretty in an i — c — . Soon after tea Hella and I went up to her room, and she said it had really been too much for her and that she could not have stood it much longer. And we went on talking about it for such a long time, that it really made both of us nearly ill. On Sunday Emmy and her husband are coming to dine with the Brs., and Hella begged me to ask her to dinner with us, or she would be quite upset. So of course she is coming here and thank goodness that will save her from feeling ill. And then she said that I must not think she wanted to come to us because of Oswald, but only for that *other* reason. I understand that perfectly well, and she does not need to make any excuses to me.

29th. Hella came to dinner to-day, she was wearing a new dress, a light strawberry colour, and it suited her admirably. In the evening Oswald said: “two or three years more, and Hella will look ripping.” It does annoy me so this continual *will*. Hella’s father simply said of me that I *was* charming,, and not that idiotic: I *was going to become* charming. I do hate the way people always talk out into the future. However, Oswald paid Hella a great deal of attention. In the afternoon, when Hella and I were talking about him, I wanted to turn the conversation to Lajos, but she flushed up and said he was utterly false, for since October he had only been to see them once, on a Sunday, just when they were going to the theatre. Of course he says he does not care a jot about the visits unless he can see her alone. She can’t realise that that shows the greatness of his love. I understand it perfectly. But it is really monstrous that Jeno has asked after me only once, quite casually. And he really might have sent me a card at Christmas. But that’s what young men are like. The proverb really applies to them: Out of sight out of mind.

December 30th. Frau Richter called to-day, but only in the morning for a quarter of an hour. Not a word was said about Viktor, though I stayed in the drawing-room on purpose. Dora did not put in an appearance, though I’m sure she was at home. He is extraordinarily like his mother, he has the same lovely straight nose, and the small mouth and well-cut lips; but he is

very tall and she is quite small half a head shorter than Mother. We owe them a call, but I don't much think that we shall go.

December 31st. I really have no time, since this is New Year's Eve, but I simply *must* write. Dora and I went skating this morning, and we met Viktor on the ice; he went frightfully pale, saluted, and spoke to us; Dora wished to pass on, but he detained her and said that she must allow him to have a talk, so he came skating with us since she would not go to a confectioner's with him. She was certainly quite right not to go to a confectioner's. Of course I don't know what they talked about, but in the afternoon Dora cried frightfully, and Viktor never said good-bye to me; it's impossible that he can have forgotten, so either I must have been too far away at the time, or else Dora did not want him to; most likely the latter. I'm frantically sorry for him, for he is passionately in love with her. But she won't come to her senses until it is too late. I don't think she has said a word to Mother either. But all the afternoon she was playing melancholy music, and that shows how much she had felt it.

January 2nd. Yesterday I had no time to write because we had callers, pretty dull for the most part, the Listes and the Trobisches; Julie Tr. is such a stupid creature, and I don't believe she knows the first thing about *those matters*; Annie is not quite all there, Lotte is the only tolerable one. Still, since we played round games for prizes, it was not as dull as it might have been, and Fritz and Rudl are quite nice boys. In the evening Mother was so tired out that Father said he really must put a stop to all this calling; I can't say I care much myself for *that* sort of visits, especially since Dora always will talk about *books*. People always talk about such frightfully dull books whenever they have nothing else to say. School began again to-day, with a German lesson thank goodness. Though I'm not superstitious in general, I must say I do like a good beginning. Besides, first thing in the morning we met two chimneysweeps, and without our having tried to arrange it in any way they passed us on our *left*. That ought to bring good luck.

January 5th. Most important, Hella since yesterday evening —— —— ! She did not come to school yesterday, for the day before she felt frightfully bad, and her mother really began to think she was going to have another attack of appendicitis. Instead of that!!! She looks so ill and interesting, I spent the whole afternoon and evening with her; and at first she did not want to tell me what was the matter. But when I said I should

go away if she did not tell me, she said: “All right, but you must not make such idiotic faces, and above all you must not look at me.” “Very well,” I said, “I won’t look, but tell me everything about it.” So then she told me that she had felt frantically bad, as if she was being cut in two, much worse than after the appendicitis operation, and then she had frantically high fever and shivered at the same time, all Friday, and yesterday ——— tableau!! And then her mother told her the chief things, though she knew them already. Earlier on Friday the doctor had said: “Don’t let us be in a hurry to think about a relapse, there may be *other!!* causes.” And then he whispered to her mother, but Hella caught the word *enlighten*. Then she knew directly what time of day it was. She acted the innocent to her mother, as if she knew nothing at all, and her mother kissed her and said, now you are not a child any more, now you belong among the grown-ups. How absurd, so *I* am still a child! After all, on July 30th I shall be 14 too, and at least one month before I shall have it too, so I shan’t be a *child* for more than six months more. Hella and I laughed frightfully, but she is really a little puffed up about it; she won’t admit that she is, but I noticed it quite clearly. The only girl I know who did not put on airs when that happened was Ada. Because of the school Hella is awfully shy, and before her father too. But her mother has promised her not to tell him. If only one can trust her!!!

January 7th. Hella came to school to-day *in spite of everything*. I kept on looking at her, and in the interval she said: “I have told you already that you must not stare at me in that idiotic way, and this is the second time I’ve had to speak to you about it. One must not make a joke about such things.” I was not going to stand that. One must not look at her; very well, in the third lesson I sat turning away from her; then suddenly she hooked one of my feet with hers so that I nearly burst out laughing, and she said: “Do look round, for that way is even stupider.” Of course Dunker promptly called us to order, that is, she told Hella to go on reading, but Hella said promptly that she felt very unwell, and that what she had said to me was, she would have to go home at 12. All the girls looked at one another, for they all know what *unwell* means, and Frau Doktor Dunker said Hella had better leave directly, but she answered in French — that pleases Dunker awfully — that she would rather stay till the end of the lesson. It was simply splendid!

January 12th. We went to the People's Theatre to-day to the matinee of The Fourth Commandment. The parting from the grandmother was lovely; almost everyone was in tears. I managed to keep from crying because Dora was only two places from me, and so did Hella, probably for the same reason. Anyway she was not paying much attention to the play for in the main interval Lajos, who had been in the stalls, came up and said how d'you do to Hella and her mother. He wanted to go home with them after the performance. Jeno has mumps, it is a horrid sort of illness and if I had it I should never admit it. Those illnesses in which one is swelled up are the nastiest of all. The Sunday after next Lajos and Jeno have been invited to the Brs. and of course they asked me too, I am so glad.

January 18th. I have not written for a whole week, we have such a frantic lot of work, especially in French in which we are very backward, at least Dunker says so!! She can't stand Madame Arnau, that's obvious. For my part I liked Mad. Arnau a great deal better, if only because she had no pimples. And Prof. Jordan's History class is awfully difficult, because he always makes one find out the causes for oneself; one has to learn *intelligently!*, but that is very difficult in History. No one ever gets an Excellent from him, except Verbenowitsch sometimes, but she learns out of a book, not our class book, but the one on which Herr Prof. J. bases his lectures. And because she reads it all up beforehand, naturally she always knows all the causes of the war and the *consequences*. Really *consequences* means something quite different, and so Hella and I never dare look at one another when he is examining us and asks: What were the consequences of this event? Of course the Herr Prof. imagined that Franke was laughing at *him* when she was only laughing at *consequences*; and it was impossible for her to explain, especially to a gentleman!!!!

January 20th. When Dora and I were coming home from skating to-day we met Mademoiselle, and I said how d'you do to her at once, and I was asking her how *she* (much emphasised) was getting on, when suddenly I noticed that Dora had gone on, and Mademoiselle said: "Your sister seems in a great hurry, I don't want to detain her." When I caught Dora up and asked her: "Why did you run away?" she tossed her head and said: "That sort of company does not suit me." "What on earth do you mean, you were so awfully fond of Mad., and besides she is really lovely." That's true enough, she said; but it was awfully tactless of her to tell me of all that — you know what. Such an intimacy behind her parents' backs *cannot*

possibly lead to happiness. Then I got in such a fearful temper and said: “Oh do shut up. Father and Mother did not know anything about Viktor either, and you were happy enough then. It is just the secrecy that makes one so happy.” Then she said very softly: “Dear Grete, you too will change your views,” and then we did not say another word. But I was awfully angry over her meanness; for first of all she wanted to hear the whole story, although Mad. never offered to tell her, and now she pretends that *she* did not wish it. If I only knew where to find Mad. I would warn her. Anyhow, this day week at 7 I shall take care to be in W. Street, and perhaps I may meet her, for she probably has a private lesson somewhere in that neighborhood.

January 24th. Mother is very ill again to-day, *in spite of* the operation. I have decided that I won’t go on Sunday to the Brs. although Jeno will be there, and that I won’t wait about for Mademoiselle on Monday. I have not told Hella anything about this for she would probably say it was very stupid of me, but I would rather not; not because Dora has twice spoken to me pointedly about a *clear conscience*, but because I don’t enjoy anything when Mother is ill.

January 26th. Mother is an angel. Yesterday she asked Aunt Dora: “By the way, Dora, has Grete put a fresh lace tucker in her blue frock, ready for the Brs. to-morrow?” Then I said: “I’m not going Mother,” and Mother asked: “But why not, surely not on my account?” Then I rushed up to her and said: “I can’t enjoy anything when you are ill.” And then Mother was so awfully sweet, and she wept and said: “*Such moments* make one forget all pains and troubles. But really you *must* go, besides I’m a good deal better to-day, and to-morrow I shall be quite well again.” So I answered: “All right, I’ll go, but only if you are *really* well. But you must tell me *honestly*.” But in any case I shan’t go to meet Mademoiselle on Monday.

January 28th. It was Mathematics to-day at school, so I could not write yesterday. We had a heavenly time on Sunday. We laughed till our sides ached and Hella was nearly suffocated with laughing. Lajos is enough to give one fits; it was absolutely ripping the way he imitated the wife of Major Zoltan in the Academy and Captain Riffl. I can hardly write about it, for my hand shakes so with laughing when I think of it. And then, while Hella and Lajos were singing songs together, Jeno told me that every student in the Neustadt has an inamorata, a *real* one. Mostly in Vienna, but some in Wiener Neustadt though that is dangerous because of being

caught. All the officers know about it, but no one must be found out. Then I told him about Oswald's affair and he said: "Oswald was a great donkey, you'll excuse me for saying so since he's your brother; but really he made a fool of himself. He was only a civilian; it's quite different in the army." Then I got cross and said: "That's all very well, Jeno, but you are not an officer yourself, so I don't see how you can know anything about it." Then he said to Hella: "I say, Ilonka, you must keep your friend in better order, she is rather inclined to be insubordinate." She is to make a written note of every act of *insubordination*, and then he will administer *exemplary* punishment. All very fine, but it will take two to that.

January 30th. I wish I knew whether Mademoiselle really passed through W. Street again at 7 o'clock on Monday, for she certainly said very distinctly: "Au revoir, ma cherie!" She is so pretty and so pale; perhaps she is really ill, and she must be awfully nervous about ——— That would be terrible. We wonder whether she knows about certain means, but one simply can't tell her.

February 2nd. I've had a wonderful idea and Hella thinks it a positive inspiration. We are going to write anonymously to Mademoiselle about those means, and Hella will write, so that no one can recognise my writing. We think something of that sort must have happened to Mademoiselle, for the other day I heard Mother say to Aunt Dora: "If we had known that, we should never have engaged her for the children; it will be a terrible thing for her parents." And Aunt Dora said: "Yes, those are the sort of people who hide their disgrace under the water." It seems quite clear, for *disgrace* means an *illegitimate* child. And the worst of it is, that they know that she has done *that*. We must help the poor thing. And *that* is why Dora is so indignant all of a sudden. But how can she know? there is nothing to notice yet in Mademoiselle; if there had been I should certainly have seen it, for Hella often says I've a keen eye for it. That is quite true, I was the first person to notice it in the maid at Prof. Hofer's, when even Father had not noticed it.

February 4th. Well, we have written to her, at least Hella has, saying there are *such* means, and that she will find all the details in the encyclopedia. We have addressed it to F. M. and signed it "Someone who understands you." Unfortunately we shall never be able to find out whether she got the letter, but the main thing is that she *should*.

February 7th. What a frightful lot of anxiety a letter can give one! In the interval to-day the school servant came up to me and said: Please are you Fraulein Lainer of the Third. “There is a letter for you.” I blushed furiously, for I thought, it must be from Mademoiselle, but my blushing made Frau Berger think it must be from a young man: “Really I ought to give it to the head mistress; I am not allowed to deliver any letters to the pupils, but in your case I will make an exception. But please remember if it happens again I shall have to hand it in to the office.” Then I said: “Frau Berger, I am quite certain it is not from a gentleman, but from a young lady,” and when she gave it to me I saw directly that it really was not from a gentleman but only from Ada! It really is too stupid of her! At the New Year she reproached me for having broken my word, and now she begs me to enquire at the Raimund Theatre or at the People’s Theatre whether Herr G. is there; she says she can’t live without him in St. P. But in the holidays she told me that she was not in love with him, that for her he was only *a means to an end*. I’m absolutely certain she said that. Nothing will induce me to go to enquire at a theatre *office*, and Hella says too that to make *such* a suggestion is a piece of impudence. I shall just write her an ordinary letter, telling her what a row she might have got me into at school. I really think Ada has a bee in her bonnet, as Father always says.

February 10th. I never heard of such a thing! I was sent for to the office to-day because the school servant had complained that on two occasions I had thrown down some orange peel at the entrance. It’s quite true that I did drop one piece there yesterday, but I pushed it out of the way with my foot into the corner, and as for any other time I know nothing about it. But I see which way the wind is blowing. Frau Berger thought I would give her some money for that letter; just fancy, how absurd, money for a letter like that, I wouldn’t give 20 kreuzer for such a letter. But since then she’s been in a frightfully bad temper, I noticed it on Wednesday when we were wiping our shoes at the door. What I said to the head was: “It happened only once, and I kicked the peel into the corner where no one could tread on it, but I certainly did not do it twice, and Bruckner can confirm what I say.” Then the head said: “Oh well, we need not make a state affair of it, but the next time you drop something, please pick it up.” Frau Berger is furious, and all we girls in our class have decided that while we won’t make more mess than we need, still, we shan’t be too particular. If any one

of us happens to drop a piece of paper she will just let it lie. Such cheek, one really can't stand it!

February 12th. We got our reports to-day. I have not got any Satisfactories, only Praiseworthy and Excellent. Father and Mother are awfully pleased and they have given each of us 2 crowns. Indeed Dora has practically nothing but Excellents, only three Praiseworthies; but she studies frantically hard, and she is learning Latin again with Frau Doktor M. If she is still teaching the lower classes next year, I shall go too, for that way we shall have her for 3 hours longer each week. By the way, Franke has actually got Praiseworthy in Maths. and Physics, though she's hardly any good. The Nutling seems to give extraordinarily good reports, for twice in the Maths. schoolwork Hella has had an Unsatisfactory, and yet now in her report she has Praiseworthy. With Frau Doktor M. one has really to deserve one's report, and it was just the same last year with Fr. Dr. St. The worst of all is with Herr Prof. Jordan. Not a single one of us has got an Excellent except that deceitful cat Verbenowitsch. To-morrow the Brs. are giving a great birthday party because of Hella's 14th birthday. Lajos and Jeno are coming and the two Ehrenfelds, because Hella is very fond of them, especially Trude, the elder, that is she is 2 days older than Kitty, for they are *twins!!* How awful!!! They only came to the Lyz this year, and Hella meets them skating every day, I don't because we have no season tickets this year but only take day tickets when we can go, because of Mother's illness. I am giving Hella an electric torch with a very powerful reflector, so that it really lights up the whole room, and an amber necklace.

February 14th. It's a good thing that we have the half-term holiday to-day and to-morrow for that gives me time to write all about yesterday. It was simply phenomenal! I went to wish Hella many happy returns quite early, and I stayed to dinner and Lajos and Jeno had been invited to dinner too in the afternoon the 2 Ehrenfelds came and brought a box of sweets, and 3 of Hella's girl cousins and two boys, one of whom is frightfully stupid and never speaks a word, and several aunts and other ladies, for the grown-ups had their friends too. But we did not bother about them, for the dining-room, Lizzi's room, and Hella's room had been arranged for us. Hella had been sent such a lot of flowers that they nearly gave us a headache. At dinner Lajos proposed a toast to Hella and another at tea. Hella was splendid, and in the evening she said to me: "At 14 one really

does become a different being.” For in proposing his toast Lajos had said that every 7 years a human being is completely changed, and Hella thinks that is perfectly true. Thank goodness, *in 6 1/2 months I shall change my whole being too*. There really did seem to be something different about her, and when we all had to blow to extinguish the candles on her birthday cake, all except the life-light in the middle, as a sign that the other years have passed, she really got quite pale, for she was afraid that in joke or through awkwardness some one would blow out her life-light. Thank goodness it was all right. I don’t much care for such things myself, for I’m always afraid that something might happen. Of course I know that it’s only a superstition, but it would have been horribly unpleasant if anyone had blown out the life-light. *Openly!!* Lajos gave Hella an enormous *square* box of sweets, and *secretly!!* a silver ring with a heart pendant. He wanted her to wear this until it is replaced by a *gold* one — the *wedding* ring. But she can’t because of her parents, so she begged me to allow her to say that I had given it her, but that would not do either because of Father and Mother. *These* things are such a nuisance, and that is why no young man will ever go on living at home where one is continually being questioned about everything one has, and does, and wears. After tea we sang: “Had I but stayed on my lonely Hearth” and other sad songs, because they are the prettiest, and in the evening we danced while Hella’s Father played for us; and then Elwira, the tall cousin, danced the czardas with Lajos, it was wonderful. I’ve never known such a birthday party as yesterday’s. It’s only possible in winter; you can never have anything like it on my birthday, July 30th, for the people one is fondest of are never all together at that time. Really no one ought to have a birthday in the holiday months, but always sometime between the end of September and June. I do wish I were 14, I simply can’t wait. Hella’s mother said to Hella, You are not a child any longer, but a grown-up; I do wish I were too!!!

February 16th. We have a new schoolfellow. All the girls and all the staff are delighted with her. She is so small she might be only 10, but awfully pretty. She has brown curls (Hella says foxy red, but I don’t agree) hanging down to her shoulders, large brown eyes, a lovely mouth, and a complexion like milk and roses. She is the daughter of a bank manager in Hamburg; he shot himself, I don’t know why. Of course she is in mourning and it suits her wonderfully. She has a strong North German accent. Frau

Doktor Fuchs is simply infatuated with her and the head is awfully fond of her too.

February 19th. Hella and I walked home to-day with Anneliese. She is called Anneliese von Zerkwitz. Her mother has been so frightfully upset by her father's death that she'll probably have to be sent to a sanatorium; that is why Anneliese has come to Vienna to stay with her uncle. He is a professor and they live in Wiedner Hauptstrasse. Dora thinks her charming too, the whole school is in love with her, she is going to gym. with us; I am so glad. Of course she won't stand near Hella and me because she's so small; but we can always keep an eye on her, show her everything, and help her with the apparatus. Hella is a trifle jealous and says: "It seems to me that Anneliese has quite taken my place in your affections." I said that was not a bit true, but did she not think Anneliese awfully loveable? "Yes," said Hella, "but one must not neglect old friends on that account." "I certainly shan't do anything of the kind; but Anneliese really needs some one who will show her everything and explain everything." Besides, the head mistress and Frau Doktor M. placed her in front of me and said to us: "Give her a helping hand."

February 20th. It's such a pity that I can't ask Anneliese here, for Mother has been in bed for the last week. But she is going to Hella's on Sunday, and since I am going too of course I am frightfully glad. Naturally I would much rather have her here; but unfortunately it's impossible because of Mother. Dora thinks that Mother will have to have another operation, but I don't believe it, for *such* an operation can only be done *once*. What I can't understand is why there should be anything wrong with Mother if the operation was successful. Dora is afraid that Mother has cancer, that would be horrible; but I don't believe she has, because if one has cancer one can't recover.

February 23rd. It was heavenly at the Bruckners! Anneliese did not come until 4, for they don't have dinner until 3. She wore a white embroidered frock with black silk ribbons. Hella's mother kissed her with tears in her eyes. For her mother really is in a sanatorium because is suffering from *nervous* disease. Anneliese is living with her uncle and aunt. But she often cries because of her father and mother. Still, she enjoyed herself immensely in the round games, winning all the best prizes, a pocket comb and mirror, a box of sweets, a toy elephant, a negro with a vase, and other things as well. I won a pen-wiper, a double vase, a pencil

holder, a lot of sweets, and a note book, Hella won a lot of things too, and so did her two cousins and Jenny.

Then we had some music and Anneliese sang the Wacht am Rhein and a lot of folk songs; her voice is as sweet as herself. She was fetched at 7, I stayed till 8.

March 1st. To-morrow Hella and I have been in vised to Anneliese's. I am so awfully glad. I shall ask Mother to let me wear my new theatre blouse and the green spring coat and skirt. The temperature went up to 54 degrees to-day.

March 3rd. Yesterday we went to Anneliese's. She shares a room with her cousin; she is only 11 and goes to the middle school, but she is a nice girl I expected to find everything frightfully smart at Professor Arndt's, but it was not so at all. They have only 3 rooms not particularly well furnished. He has retired on a pension, Emmy is their granddaughter, she lives with them because her father is in Galicia, a captain or major I think. It was not so amusing as at Hella's. We played games without prizes, and that is dull; it is not that one plays for the sake of the prizes, but what's the use of playing if one does not win anything? Then they read aloud to us out of a story book. But what Hella and I found exasperating was that Anneliese's uncle said "Du" to us both. For Hella is 14, and I shall be 14 in a few months. But Hella was quite right; in conversation she said: "At the High School only the mistresses say Du to us, the professors *have* to say Sie." Unfortunately he went away soon after, so we don't know whether he took the hint. Hella says too that it was not particularly entertaining.

March 9th. Oh dear, Mother really has got cancer; of course Father has not told us so, but she has to have another operation. Dora has cried her eyes out and my knees are trembling. She's going to hospital on Friday. Aunt Dora is coming back on Thursday and will stay here till Mother is well again. I do so dread the operation, and still more Mother's going away. It's horrible, but still lots of people have cancer and don't die of it.

March 22nd. Mother is coming home again tomorrow. Oh I am so glad! Everything is so quiet in the hospital and one hardly dares speak in the passages. Mother said: "I don't want to stay here any longer, let me go back to my children." We went to see Mother in hospital every day and took her violets and other flowers, for she was not allowed to eat anything during the first few days after the operation. But it's quite different now that she's home again. I should have liked to stay away from school to-day,

but Mother said: “No, children, go to school, do it to please me.” So of course we went, but I simply could not attend to my lessons.

March 24th. Mother is asleep now. She looks frightfully ill and still has a lot of pain. I’m sure the doctors can’t really understand her case; for if they had operated properly she would not still have pain after the *second* operation. I should like to know *what* Mother has been talking to Dora about, for they both cried. Although Dora and I are on good terms now, she would not tell me, but said she had promised Mother not to speak about it. I can’t believe that Mother has told Dora a *secret*, but perhaps it was something about marrying. For Dora only said: “Besides, Mother did not need to say that to me, for my mind was quite made up in any case.” I do hate such hints, it’s better to say nothing at all. As soon as Mother can get up she is going to Abbazia for a change, and most likely Dora will go with her.

March 26th. Mother and Dora are going to Abbazzia next week. Dora thinks I envy her the journey, and she said: “I would *willingly* renounce the journey and the seaside if only Mother would get well. And this year when I have to matriculate, I certainly should not go for pleasure.” I’m so awfully miserable that I simply can’t wear a red ribbon in my hair, though red suits me best. I generally wear a black one now, but since yesterday a brown one, for Mother said: “Oh, Gretel, do give up that black ribbon; it looks so gloomy and does not suit you at all.” Of course I could not tell Mother *how* I was feeling, so I took the brown one and said the red ribbon was quite worn out.

April 12th. I never get my diary written. It’s so gloomy at home for Mother is very bad. Oswald is coming home to-morrow for the Easter holidays and Mother is looking forward so to seeing him. I was to have gone with Hella and her father to Maria-Zell, for this year they are probably going to take a house for the summer in Mitterbach or Mitterberg near Maria-Zell. But I am not going after all, for I don’t feel inclined, and I think Mother is better pleased that I should not; for she said: “So I shall have all my three darlings together here at Easter.” When she said that I wanted to cry, and I ran quickly out of the room so that she might not see me. But she must have seen, for after dinner she said: “Gretel, if you really *want* to go with the Bruckners, I should like you to; I should be so glad for you to have a little pleasure, you have not had much enjoyment all the winter.” And then I could not stop myself, and I burst out crying and said:

“No, Mother, I won’t go on any account. All I want is that you should get quite well again.” And then Mother cried too and said: “Darling, I’m afraid I shall never be quite well again, but I should like to stay until you are all grown up; after that you won’t need me so much.” Then Dora came in and when she saw that Mother was crying she said that Father had sent for me. He hadn’t really but in the evening she told me that Mother’s illness was hopeless, but that I must not do anything to upset her or let her see what I was feeling. And then we both cried a lot and promised one another that we would always stay with Father.

May 16th. Mother died on April 24th, the Sunday after Easter. We are all so awfully unhappy. Hardly anyone says a word at mealtimes, only Father speaks to us so lovingly. Most likely Aunt Dora will stay here for good. It’s not three weeks yet since Mother was buried, but in one way we feel as if she had already been dead three years, and in another way one is always suddenly wanting to go into her room, to ask her something or tell her something. And when we go to bed we talk about her for such a long time, and then I dream about her all night. Why should people die? Or at least only quite old people, who no longer have anyone to care about it. But a mother and a father ought never to die. The night after Mother died Hella wanted me to come and stay with them, but I preferred to stay at home; but late in the evening I did not dare to go into the hall alone, so Dora went with me. Father had locked the door into the drawing-room, where Mother was laid out, but all the same it was awfully creepy. They did not call me on the 24th until after Mother was dead; I should have so liked to see her once more. Good God, why should one die? If only I had been called Berta after her; but she did not wish that either of us should be called after her, nor did Father wish it in Oswald’s case.

May 19th. When Mother was buried, one thing made me frightfully angry with Dora, at least not really angry but hurt, that *she* should have gone into church and come out of church with Father. For *I* have always gone with Father and Dora has always gone with Mother. And while poor Mother was in hospital, Dora went with Aunt. But at the funeral Father went with her, and I had to go with Aunt Dora. A few days later I spoke to her about it, and she said it was quite natural because she is the elder. She said that Oswald ought to have gone with me, that that would have been the proper thing. But he went alone. Another thing that annoys me is this; when Aunt Dora came here in the autumn, Dora and I sat on the same side

of the table at dinner and supper, and Aunt sat opposite Mother, and when Mother took to her bed her place was left vacant. After she died Oswald sat on the fourth side, and now for about a week Dora has been sitting in Mother's place. I can't understand how Father can allow it!

May 19th. At dinner to-day no one could eat anything. For we had breast of veal, and we had had the same thing on the day of poor Mother's funeral, and when the joint was brought in I happened to look at Dora and saw that she was quite red and was sobbing frightfully. Then I could not contain myself any more and said: "I can't eat any breast of veal, for on Mother's burial day —— — ," then I could not say any more, and Father stood up and came round to me, and Dora and Aunt Dora burst out crying too. And after dinner Aunt promised us that we should never have breast of veal again. For tea, Aunt Dora ordered an Ulm cake because we had eaten hardly anything at dinner.

May 26th. To-day is the first day of Dora's written matriculation. Father wanted her to withdraw because she looks so ill, but she would not for she said it would be a distraction for her and that she would like to finish with the High School. Next year she is to go to a preparatory school for the Gymnasium. She ought really to go to a dancing class, for she is nearly 17, but since she is in mourning it is quite impossible and of course she does not want to go anyhow. The head thought too that Dora would withdraw from the examination because she is so overwrought, but she did not want to withdraw. The staff were so awfully sweet to us after Mother's death, at least the women teachers were. The professors don't bother themselves about our private concerns, for they only see us for 1 or 2 hours a week. Frau Doktor Steiner, from whom we don't have any lessons this year, was awfully sympathetic; I saw plainly that she had tears in her eyes, and Frau Doktor M. was an angel as she always is! We did not go to the spring festival on May 20th, though Father said we could go if we liked. Hella and Anneliese were awfully anxious that I should go; but I would not, and indeed I shall never go to any more amusements. No doubt the others enjoyed themselves immensely, but for Dora and me it would have been horrible. In the evenings I often fancy to myself that it is not really true, that Mother has simply gone to Franzensbad and will be back soon. And then I cry until my head aches or until Dora says: "Oh Gretel, I do wish you'd stop, it's awful." She often cries herself, I can hear her quite well, but *I* never say anything.

June 4th. So Dora looks upon Mother's death as *a sign of God's displeasure against Father!* But what could *we* have done to prevent it? She said, Oh, yes, we did a lot of things we ought not to have done, and above all we had secrets from Mother. That is why God has punished us. It's horrible, and now that she is always speaking of the eye of God and the finger of God it makes me so terribly afraid to go into a dark room, because I always feel there is some one there who is eying me and wants to seize me.

June 8th. Father is in a frightful rage with Dora; yesterday evening, when I opened the drawing-room door and there was Father coming out, quite unintentionally I gave a yell, and when Father asked what was the matter I told him about God's displeasure; only I did not tell him it was against him, but only against Dora and me. And then Father was frightfully angry for the first time since Mother's death, and he told Dora she was not to upset me with her ill-conditioned fancies, and Dora nearly had an attack of palpitation so that the doctor had to be sent for. Aunt came to sleep in our room and we both had to take bromide. To-day Father was awfully kind to us and said: "Girls, you've no reason to reproach yourselves, you have always been good children, and I hope you always will be good." Yes, I will be, for Mother's eye watches over us. Hella thinks I look very poorly, and she asked me to-day whether perhaps . . . . ?? But I told her that I would not talk about such things any more, that it would be an offence to my Mother's memory. She wanted to say something more, but I said: "No, Hella, I simply won't talk about *that* any more. You can't understand, because your mother is still alive."

June 12th. It is awful; just when I did not want to think any more about *such* things, there comes an affair of that very sort! I'm in a frightful mess through no fault of my own. Just after 9 to-day a girl from the Second came in to our Mathematic lesson and said: "The head mistress wishes to see Lainer, Bruckner, and Franke in the office directly." All the girls looked at us, but we did not know why. When we came into the office, the door of the head's room was shut and Fraulein N. told us to wait. Then the head came out and called me in. Inside a lady was sitting, and she looked at me through a lorgnon. "Do you spend much time with Zerkwitz?" asked the head. "Yes, said I," and I had a foreboding. "This lady is Zerkwitz's mother, she complains that you talk about very improper things with her daughter; is it so?" "Hella and I never wanted to tell her anything; but she

begged us to again and again, and besides we thought she really knew it anyhow and only pretended she didn't." "*What* did you think she knew, and what did you talk to her about?" broke in Anneliese's mother. "Excuse me," said the head, "I will examine the girls; so Bruckner was concerned in the matter too?" "Very seldom," said I; "Yes, the chief offender is Lainer, *the girl whose mother died recently*." Then I choked down my tears, and said: "We should never have said a word about these matters unless Anneliese had kept on at us." After that I would not answer any more questions. Then Hella was called in. She told me afterwards that she knew what was up directly she saw my face. "What have you been talking about to Zerkwitz?" Hella would not say at first, but then she said in as few words as possible: "About getting babies, and about being married!" "Gracious goodness, such little brats, and to talk about *such* things," said Anneliese's mother. "Such corrupt minds." "We did not believe that Anneliese did not *really* know, or we should never have told her anything," said Hella just as I had; she was simply splendid. "As regards Alfred, we have nothing to do with that, and we have often advised her not to allow him to meet her coming home from school; but she would not listen to us." "I am talking about your conversations with which you have corrupted the poor innocent child," said Frau von Zerkwitz. "She certainly must have known something about it before, or she would not have gone with Alfred or wanted to talk about it with us," said Hella. "Heavenly Father, that is worse still; such corruptness of mind!" Then we were sent out of the room. Outside, Hella cried frightfully, and so did I, for we were afraid there would be a row at home. We could not go back into the Mathematic lesson because we had been crying such a lot. In the interval Hella walked past Anneliese and said out loud: "Traitress!!" and spat at her. For that she was ordered out of the ranks. I stepped out of the ranks too, and when Frau Professor Kreindl said: "Not you, Lainer, you go on," I said: "Excuse me, I spat at her *too*," and went and stood beside Hella. All the girls looked at us. It was plain that Frau Prof. Kreindl knew all about it already for she did not say any more. In the German lesson from 11 to 12 Frau Doktor M. said: "Girls, why can't you keep the peace together? This continual misconduct is really too bad, and serves only to make trouble for you and for your parents and for us." Just before 12 Hella and I were summoned to the head's room again. "Girls," she said, "it's a horrible business this. Even if your own imaginations have been prematurely poisoned, why

should you try to corrupt others? As for you, Lainer, you ought to be especially ashamed of yourself that such complaints should be made of you when your mother has been buried only a few weeks." "Excuse me," said Hella, "all this happened in the spring, and even earlier, in the winter, for we were still skating at the time. Rita's mother was pretty well then. Besides, Zerkwitz was continually pestering us to tell her. I often warned Rita, and said: 'Don't trust her,' but she was quite infatuated with Zerkwitz. Please, Frau Direktorin, don't say anything about it to Rita's father, for he would be frightfully upset."

Hella was simply splendid, I shall never forget. She does not want me to write that; we are writing together. Hella thinks we must write it all down word for word, for one never can tell what use it may be. No one ever had a friend like Hella, and she is so brave and clever. "You are just as clever," she says, "but you get so easily overawed, and besides you are still quite nervous because of your mother's death. I only hope your father won't hear anything about it." That stupid idiot dug up the old story about the two students on the ice, a thing that was over and done with ages ago. "You should never trust anyone," says Hella, and she's perfectly right. I never could have believed Anneliese would be such a sneak. We don't know yet what was up with Franke. As she came in she put her finger to her lips, meaning of course "Betray nothing!"

June 15th. The school inspector came to-day. I was at the blackboard in the Maths lesson, when there was a knock at the door and the head came in with the Herr Insp. For a moment I thought he had come about *that matter*, and I went as white as a sheet (at least the girls say I did; Hella says I looked like Niobe mourning for her children). Thank goodness, the sum was an easy one, and besides I can always do sums; in Maths and French I am the best in the class. But the Herr Insp. saw that I had tears in my eyes and said something to the head; then the head said: "She has recently lost her mother." Then the Herr Insp. praised me, and like a stupid idiot I must needs begin to howl. The head said: "It's all right L., sit down," and stroked my hair. She is so awfully sweet, and I do hope that she and Frau Doktor M. will say a word for me at the Staff Meeting. And I do hope that Father won't hear anything of it, for of course he would reproach me dreadfully because it all comes so soon after Mother's death. But really it all happened long before that. The way it all happened was that Hella's mother went away to see Emmy, her married niece, who was *having her*

first baby. And then it was that we told the “innocent child” (that’s what we call the deceitful cat) everything. Hella still thinks that the “innocent child” was a humbug. That is quite likely, for after all she is nearly fourteen; and at 14 one must *surely* know a great deal already; it’s impossible that at that age a girl can continue to believe in the stork story, as Anneliese is said!!! to have done. Hella thinks that I shall soon be “developed” too, because I always have such black rings under my eyes. I overheard Frau von Zerkwitz say, “Little brats;” but Hella says that the head *hemmed loudly to drown it*. Afterwards Hella was in fits of laughter over the expression “little brats” for her mother always says about *such* things; *Little brats* like you have no concern with such matters. Good Lord, when is one to learn all about it if one does not know when one is nearly 14! As a matter of fact both Hella and I learned these things *very early*, and it has not done us any harm. Hella’s mother always says that if one learns such things too early one gets to look old; but of course that’s nonsense. But why do mothers not want us to know? I suppose they’re just ashamed.

June 16th. Yesterday evening after we had gone to bed, Dora said: “What were you really talking about to Z., or whatever her name is? The head called me into the office to-day and told me that you had been talking of improper matters. She said I must watch over you in *Mother’s place!*” Well that would be a fine thing! Besides, it all happened when Mother was still alive. A mother never knows what children are talking of together. Dora thinks that I shall have a written Reprimand from the Staff Meeting. I should hate that because of Father; that would mean another fearful row; although Father is really awfully sweet now; I have not had a single rowing since Mother first got ill. It’s quite true that death makes people gentle, but why? Really one would have thought people would get disagreeable, because they’ve been so much distressed. Last week the tombstone was put up and we all went to see it. I should like to go alone to the cemetery once at least, for one does not like to weep before the others.

June 18th. The “innocent child” does not come to gym. any longer, at least she has not been since *that affair*. We think she’s afraid, although we should not say anything to her. We punish her with *silent contempt*, she’ll *feel* that *more than anything*. And thank goodness she does not come to play tennis. I do hate people who are *deceitful*, for one never knows where to have them. When a girl tells an outright cram, then I can at least say to

her: Oh, clear out, don't tell such a frightful whacker; I was not born yesterday. But one has no safeguard against *deceitfulness*. That's why I don't like cats. We have another name for the "innocent child," we call her the "red cat." I think she knows. Day after tomorrow is the school outing to Carnuntum. I am so excited. We have to be at the quay at half past 7.

June 21st. The outing was lovely. Hella was to come and fetch me. But she overslept herself, so her mother took a taxi; and luckily I had waited for her. I should like to be always driving in a taxi. Dora would not wait, and went away at a quarter to 7 by electric car. At a quarter to 8 Hella came in the taxi, and just before the ship weighed anchor (I believe one ought only to say that of a sailing ship at sea, but it does not matter, I'm not Marina who knows *everything* about the navy), that is just at the right moment, we arrived. They all stared at us when we came rushing up in the taxi. I tumbled down as I got out of the car, it was stupid; but I don't think they all noticed it. Aunt Dora said that for this one day we had better put off our mourning, and Father said so too, so we wore our white embroidered frocks and Aunt Dora was awfully good and had made us black sashes; it looked frightfully smart, and they say that people wear mourning like that in America. I do love America, the land of liberty. Boys (that is young students) and girls go to school *together* there!! —— — But about the outing. In the boat we sat next Frau Doktor M., she was awfully nice; Hella was on the right and I was on the left, and we sat so close that she said: "Girls, you're squashing me, or at least you're crushing my dress!" She was wearing a white frock and had a coral necklace which suited her simply splendidly. When we were near Hainburg Hella's hat fell into the Danube, and all the girls screamed because they thought a child had fallen overboard. But thank goodness it was only the hat. We went up the Schlossberg and had a lovely view, that is, *I* did not look at anything except Frau Doktor M. because she was so lovely; Professor Wilke was with us, and he went about with her all the time. The girls say he will probably marry her, perhaps in the holidays. Oh dear, *that* would be horrid. Hella thinks that is quite out of the question because of the German professor; at any rate it would be better for her to marry Professor W. than the other, because he is said to be a Jew. "Still, with regard to all the things that hang upon marriage, it's the same with every man," said I. "That's just the chief point, you little goose," said Hella. And Frau Doktor M. said: "Do you allow your chum to talk to you like that?

What is the chief point?" I was just going to say: "We *can't* tell you *that*," when Hella interrupted me and said: "Just because I'm her chum I can talk to her like that; she would not let anyone else do it." Then we went to dinner. Unfortunately we did not sit next "*her*." We had veal cutlets and four pieces of chocolate cake, and as the Herr Religionsprof. went by he said: "How many weeks have you been fasting?" Before dinner we went to the museum to see the things they had dug up in the Roman camp. The head mistress and Fraulein V. explained everything. It was most instructive. In the afternoon we went to Deutsch-Altenburg. It was great fun at tea. Then we had games and all the staff joined in, the Fifth had got up a comedy by one of the girls. We were all in fits of laughter. Then suddenly there came along a whole troop of officers of the flying corps, frightfully smart, and one of them sat down at the piano and began to play dance music. Another came up to the head and begged her to allow the "young ladies" to dance. The head did not want to at first, but all the girls of the Fifth and Sixth begged her to, and the Herr Rel. Prof. said: "Oh, Frau Direktorin, let them have the innocent pleasure," and so they really were allowed to dance. The rest of us either danced with one another or looked on. And then, when Hella and I were standing right in front, up came a splendid lieutenant and said: "May I venture to separate the two friends for a little dance?" "If you please," said I, and sailed off with him. To dance with a lieutenant is glorious. Then the same lieutenant danced with Hella and in the evening on the way home she said that the lieutenant had really wanted to dance with her first, but I had been so prompt with my "If you please" and had placed my hand on his shoulder. Of course that's not true, but it is not a thing one would quarrel about with one's best friend, and anyhow he danced with both of us. Unfortunately we were not able to dance very long because we got so hot. Oh, and I had almost forgotten, a captain with a black moustache saluted Frau Doktor M., for they know one another. She blushed furiously; so he is probably the man she will marry, and not Herr Prof. Wilke and not the Jewish professor. He would please me a great deal better. They were all so awfully smart! Before we left a lieutenant brought in a huge bunch of roses, and the officers gave a rose to each member of the staff, the ladies I mean. Then something awfully funny happened. There is a girl in the Sixth who looks quite old, as if she might be 24, and "our" lieutenant offered her a rose too. And then she said: "No thank you, I am not one of the staff, I'm in the

Sixth." Everyone burst out laughing, and she was quite abashed because the lieutenant had taken her for one of the staff. And the Herr Rel. Prof. said to her: "Tschapperl, you might just as well have taken it." But really she was quite right to refuse. I think there must have been 20 officers at least. Of course Hella told the lieutenant that she was a colonel's daughter. I wonder if we shall ever see him again.

I am writing this four days after the outing. Dora told me yesterday that when I was dancing with the lieutenant the Herr Rel. Prof. said to the Frau Direktorin: "Do just look at that young Lainer; little rogue, see what eyes she's making." Making eyes, forsooth! I did not make eyes, besides, what does it mean anyhow to make eyes!! Of course I did not shut my eyes; if I had I should probably have fallen down, and then everyone would have laughed. And I don't like being laughed at. I hardly saw Dora all through the outing, and she did not dance. She said very cuttingly: "Of course not, for after all we *are* in mourning, even if we did wear white dresses; you are only a child, for whom that sort of thing does not matter." *That sort of thing*, as if I had done something dreadful! I don't love Mother any the less, and I don't forget her. Father was quite different; the day before yesterday evening he said: "So my little witch has made a conquest; you're beginning early. But it's no good taking up with an officer, little witch, they're too expensive." But I would like to have the lieutenant, I would go up with him in an aeroplane, up, up, till we both got quite giddy. In the religion lesson yesterday, when the Herr Prof. came in he laughed like anything and said: "Hullo, Lainer, is the world still spinning round you? The Herr Leutnant has not been able to sleep since." So I suppose he knows him. Still, I'm quite sure that he has not lost his sleep on my account, though very likely he said so. If I only knew what his name is, perhaps Leo or Romeo; yes, Romeo, that would suit him admirably!

June 26th. When I was writing hard yesterday Aunt Alma came with Marina and that jackanapes Erwin who was really responsible for all the row that time. Since Mother died we have been meeting again. I don't think Mother liked Aunt Alma much, nor she her. Just as Father and Aunt Dora are not particularly fond of one another. It is so in most families, the father does not care much for the mother's brothers and sisters and vice versa. I wonder why? I wonder whether *He* has a fiancee, probably he has, and what she looks like. I wish I knew whether He likes brown hair or fair hair or black hair best. But about the visit! Of course Marina and I were

very standoffish. She is so frightfully conceited because she goes to the Training College. As if that were something magnificent! The High School is much more important, for from the High School one goes on to the university, but not from the Training College; and they don't learn English, nor French properly, for it is only optional. Aunt Alma knows that it annoys Father when anyone says we don't look well, so she said: "Why, Dora looks quite overworked; thank goodness it's nearly over, and she won't get much out of it after all, it's really better for a girl to become a teacher." Erwin lounged in his chair and said to me: "Do you dare me to spit on the carpet?" "You are ill-bred enough to do it; I can't think why Marina, the future schoolmistress, does not give you a good smacking," said I. Then Aunt Alma chimed in: "What's the matter children? What game are you playing?" "It's not a game at all; Erwin wants to spit on the carpet and he seems to think that would be all right." Then Aunt said something to him in Italian, and he pulled a long nose at me behind Father's back, but I simply ignored it; little pig, and yet he's my cousin! Kamillo is supposed to have been just as impudent as Bub. But we have never seen him, for he has been in Japan as an ensign for the last two years. Mourning does not suit Marina at all; there's a provincial look about her and she can't shake it off. Her clothes are too long and she has not got a trace of b — , although she was 17 last September; she is disgustingly thin.

June 27th. The Herr Insp. came to our class to-day, in French this time. Frau Doktor Dunker is always frightfully excited by his visits, and at the beginning of the lesson she said: "Girls, the Inspector is coming to-day; pull yourselves together; please don't leave me in the lurch." So it must be true what Oswald always says that the inspectors come to inspect the teachers and not the pupils. "At the inspection," Oswald often says, "every pupil has the professor in his hands." Being first, of course I was called upon, and I simply could not think what "trotteur" meant. I would not say "Trottel" [idiot], and so I said nothing at all. Then Anneliese turned round and whispered it to me, but of course I was not going to say it after her, but remained speechless as an owl. At length the Herr Inspektor said: "Translate the sentence right to the end, and then you'll grasp its meaning." But I can't see the sense of that; for if I don't know one of the words the sentence has no meaning, or at least not the meaning it ought to have. If Hella had not been absent to-day because of —— , she might have

been able to whisper it to me. Afterwards Frau Doktor Dunker reproached me, saying that no one could ever trust anyone, and that I really did not deserve a One. “And the stupidest thing of all was that you laughed when you did not know a simple word like that.” Of course I could not tell her that my first thought had been to translate it “Trottel.” Unseen translation is really too difficult for us.

June 28th. The Staff Meeting is to-day. I’m on tenter hooks to know whether I shall have a Reprimand, or a bad conduct mark in my report. That would be awful. It does not matter so much to Hella, for her father has just gone away to manoeuvres in Hungary or in Bosnia, and by the time he is back the holidays will have begun and no one will be bothering about reports any more. So I shall know to-morrow. Oh bother, to-morrow is a holiday and next day is Sunday. So for another 2 1/2 days I shall have “to linger in suspense,” but a different sort of suspense from what Goethe wrote about.

June 30th. We were at home yesterday and this afternoon because of Dora’s matriculation. The Bruckners went to Breitenstein to visit an aunt, who is in a convalescent home, and so I could not go with them. In the evening we went to Turkenschanz Park to supper, but there was nothing on. By the way, I have not written anything yet about the “innocent child” at the outing. On the boat she began fussing round Hella and me and wanted to push into the conversation, indirectly of course! But she did not succeed; Hella is extraordinarily clever in such matters; she simply seemed to look through her Really I’m a little sorry for her, for she hasn’t any close friends beyond ourselves; but Hella said: “Haven’t you had enough of it yet? Do you want to be cooked once more with the same sauce?” And when Hella’s hat fell into the water and we were still looking after it in fits of laughter, all of a sudden we found Anneliese standing behind us offering Hella a fine lace shawl which she had brought with her for the evening because she so readily gets earache. “Wouldn’t you like to use this shawl, so that you won’t have to go back to Vienna without a hat?” “Please don’t trouble yourself, I’m quite used to going about bare-headed.” But the *way* she said it, like a queen! I *must* learn it from her. She is really shorter than I am, but at such moments she looks just like a grownup lady. I told her as much, and she rejoined: “Darling Rita, you can’t *learn* a thing like that; it’s *inborn*.” She rather annoyed me, for she always seems to think that an officer’s daughter is a thing apart.

July 1st. Thank goodness, everything has passed off without a public scandal. Frau Doktor M. spoke to me in the corridor, saying: “Lainer, you’ve had a narrow escape. If certain voices had not been raised on your behalf, I really don’t know —— — .” Then I said: “I’m quite certain, Frau Doktor, that you alone have saved me from a Bad Conduct Mark.” And I kissed her hand. “Get along, you little baggage, for the one part simply a child, and for the other with your head full of thoughts which grown-ups would do well to dispense with.”

After all, one can’t help one’s *thoughts*, and we shall be more careful in future as to the persons to whom we talk about *that sort of thing*. Here’s another thing I forgot to mention about the outing: When we got back into Vienna by rail, most of the parents came to meet us at the station; Father was there too, and so was the “innocent child’s” mother. Thank goodness Father did not know her. When we got out of the train there was a great scrimmage, because we were all trying to sort ourselves to our parents, and suddenly I heard Hella’s voice: “No, Madam, your child is not in our bad company.” I turned round sharply, and there was Hella standing in front of Frau von Zerkwitz who had just asked her: “Hullo, *you*, what has become of my little Anneliese?” The answer was splendid; I should never have been able to hit upon it; I always think of good repartees after the event. It was just the same that time when the old gentleman in the theatre asked Hella if she was alone there, and she snapped at him. He said: Impudent as a Jewess, or an impudent Jewess! It was too absurd, for first of all it’s not impudent to make a clever repartee, and secondly it does not follow because one can do it that one is a Jewess. So Hella finished up by saying to him: “No, you’ve made a mistake, you are not speaking to one of your own sort.”

We break up on the 6th; but because of Dora’s matriculation we are staying here until the 11th. Then we are going to Fieberbrunn in Tyrol, and this year we shall stay in a hotel, so I am awfully pleased. Hella had a splendid time there last year.

July 2nd. My goodness, to-day I have . . . ., no, I can’t write it plain out. In the middle of the Physics lesson, during revision, when I was not thinking of anything in particular, Fraulein N. came in with a paper to be signed. As we all stood up I thought to myself: Hullo, what’s that? And then it suddenly occurred to me: Aha!! In the interval Hella asked me why I had got so fiery red in the Physics lesson, if I’d had some sweets with

me. I did not want to tell her the real reason directly, and so I said: “Oh no, I had nearly fallen asleep from boredom, and when Fraulein N. came in it gave me a start.” On the way home I was very silent, and I walked so slowly (for of course one must not walk fast *when* . . .) that Hella said: “Look here, what’s up to-day, that you are so frightfully solemn? Have you fallen in love without my knowing it, or is it *at long last* . . . .?” Then I said “*Or is it at long last!*” And she said: “Ah, then now we’re equals once more,” and there in the middle of the street she gave me a kiss. Just at that moment two students went by and one of them said: “Give me one too.” And Hella said: “Yes, I’ll give you one on the cheek which will burn.” So they hurried away. We really had no use for them: to-day!! Hella wanted me to tell her *everything about it*; but really I hadn’t anything to tell, and yet she believed that I *wouldn’t* tell. It is really very unpleasant, and this evening I shall have to take frightful care because of Dora. But I must tell Aunt because I want a San — T — . It will be frightfully awkward. It was different in Hella’s case, first of all because she had such frightful cramps before it began so that her mother knew all about it without being told, and secondly because it was her *mother*. I certainly shan’t tell Dora whatever happens, for that would make me feel still more ashamed. As for a San — T — , I shall never be able to buy one for myself even if I live to be 80. And it would be awful for Father to know about it. I wonder whether men really do know; I suppose they must know about their wives, but at any rate they can’t know anything about their daughters.

July 3rd. Dora does know after all. For I switched off the light *before* I undressed, and then Dora snapped at me: “What on earth are you up to, switch it on again directly.” “No I won’t.” Then she came over and wanted to switch it on herself; “Oh do please wait until I’ve got into bed.” “O-o-h, is that it,” said Dora, “why didn’t you say so before? I’ve always hidden my things from you, and you haven’t got any yet.” And then we talked for quite a long time, and she told me that Mother had commissioned her to tell me everything *when* —— — Mother had told her all about it, but she said it was better for one girl to tell it to another, because that was least awkward. Mother knew too that in January Hella had . . . But how? I never let on! It was midnight before we switched off the light.

July 6th. Oh, I am so unhappy, when we went to get our reports to-day and said good-bye to Frau Doktor M., she was awfully sweet, and at the end she said: “I hope that you won’t give too much trouble to my

successor.” At first we did not understand, for we thought she only meant that it is always uncertain whether the same member of the staff will keep the same class from year to year, but then she said: “I am leaving the school because I am going to be married.” It gave me such a pang, and I said: “Oh, is it true?” “Yes, Lainer, it’s quite true.” And all the girls thronged round her and wanted to kiss her hand. No one spoke for a moment, and then Hella said: “Frau Doktor, may I ask you something? But you mustn’t be angry!” “All right, ask away!” “Is it the captain we met in Carnuntum?” She was quite puzzled for a minute, and then she laughed like anything and said, “No, Bruckner, it is not he, for he has a wife already.” And Gilly, who is not so frightfully fond of her as Hella and I are, said: “Frau Doktor, please tell us whom you are going to marry.” “There’s no secret about it, I am going to marry a professor in Heidelberg.” That is why she has to leave the High School. It’s simply ruined my holidays. Hella has such lovely ideas. The girls would not leave Frau Doktor alone, and they all wanted to walk home with her. Then she said: “My darling girls, that’s impossible, for I am going to Purkersdorf to see my parents.” And then Hella had her splendid idea. The others said: “Please may we come with you as far as the metropolitan?” and at length she said they might. But Hella said, “Come along,” and we hurried off to the metropolitan before them and took tickets to Hutteldorf so that we should be able to get back in plenty of time, and there we were waiting on the platform when she came and when all the girls came with her as far as the entrance. Then we rushed up to her and got into the train which came in at that moment. Of course we had second class tickets, for Hella, being an officer’s daughter, mayn’t travel third, and Frau Doktor M. always travels second too. And we all three sat together on a seat for two, though it was frightfully hot. She was so nice to us; I begged her to give us her photograph and she promised to send us one. Then, alas, we got to Hutteldorf. “Now, girls, you must get out.” Then we both burst out crying, and she *kissed us!* Never shall I forget that blessed moment and that heavenly ride! As long as the train was still in sight we both waved our handkerchiefs to her and she *waved back!* When we wanted to give up our tickets Hella looked everywhere for her purse and could not find it; she must have left it in the ticket office. Luckily I still had all my July pocket money and so I was able to pay the excess fare, and then for once in a way *I* was the sharp-witted one; I said we had travelled third and had only

passed out through the second, so we had not to pay so much; and no one knew anything about it, there's no harm in that sort of cheating. Of course we really did go back third, although Hella said it would spoil the memory for her. That sort of thing does not matter to me. We did not get home until a quarter past 1, and Aunt Dora gave me a tremendous scolding. I said I had been arranging books in the library for Frau Doktor, but Dora had enquired at the High School at 12, and there had been no one there. We had already gone away then, I said, and had gone part of the way with Frau Doktor M., for she was leaving because of her marriage. Then Dora was quite astonished and said: "Ah, now I understand." The other day when she had to go into the room while the staff meeting was on, the staff was talking about an engagement, and Fraulein Thim was saying: "Not everyone has the luck to get a university professor." That must have been about *her*. Certainly Thim won't get one, not even a school porter. To-day, (I've been writing this up for two days), I had such a delightful surprise; *she* sent me her photo, simply heavenly!! Father says the portrait is better looking than the reality. Nothing of the sort, she is perfectly beautiful, with her lovely eyes and her spiritual expression! Of course she has sent Hella a photo too. We are going to have pocket leather cases made for the photographs, so that we can take them with us wherever we go. But we shall have to wait until after the holidays because Hella has lost her money, and nearly all mine was used up in paying the excess fares. And such a leather case will cost 3 crowns. Father has some untearable transparent envelopes, and I shall ask him for two of them. They will do as a makeshift.

Dora's matriculation is to-morrow, she's quite nervous about it although she is very well up in all the subjects. But she says it's so easy to make mistakes. But Father is quite unconcerned, though last year he was very much bothered about Oswald, and poor dear Mother was frightfully anxious: "Pooh," said Oswald, "I shall soon show them that there's no need to bother; all one wants at the metric is *cheek*, that's the whole secret!" And then all he telegraphed was "durch" [through] and poor Mother was still very anxious, and thought that it might mean *durchgefallen* [failed]. But of course it really meant *durchgekommen* [passed], for meanwhile the second telegram had come. And father had brought two bottles of champagne to Rodaun, ready to celebrate Oswald's return. There won't be anything of the sort after Dora's matriculation

because Mother is not with us any more; oh it does make me so miserable when I think that 2 1/2 months ago she was still alive, and now —— — .

July 9th. This morning, while Dora was having her exam (she passed with Distinction), I went to the cemetery quite alone. I told Aunt Dora I was going shopping with Hella and her mother, and I told Hella I was going with Aunt, and so I took the tram to Potzleinsdorf and then walked to the cemetery. People always ought to go to the cemetery alone. There was no one in the place but me. I did not dare to stay long, for I was afraid I should be home late. It's a frightfully long way to Potzleinsdorf, and it always seems so much further when one is alone. And when I came away from the cemetery I took a wrong turning and found myself in a quite deserted street near the Turkenschanze. That sort of thing is very awkward, and for a long time there was simply no one of whom I could ask the way. Then by good luck an old lady came along, and she told me I had only to take the next turning to get back to the tram line. And just as I did get there a Potzleinsdorf car came along, so I got in and reached home long before Dora. But in the afternoon Hella nearly gave me away, quite unintentionally. But since they were all talking about the matriculation I was able to smooth it over. Now that Dora has finished her matriculation she will have to tell me a great deal more about *certain things*; she promised she would. Before the matriculation she was always so tired because of the frightful grind, but that is over now, and I never do any work in the holidays. What are holidays for? Frau Doktor Dunker has really given me only a Satisfactory, it's awfully mean of her; and I shall have to learn from *her* for three years more! Nothing will induce me to bother myself about French now, for she has a down on me, and when one's teacher has a down on one, one can work as hard as one likes and it's no good. It was so different with Frau Doktor M.!! I have just been looking at her photo so long that my eyes are positively burning; but I had to write up about to-day: even when one had been stupid once or twice, she never cast it up against one, never, never, never —— the sweet angel!

July 10th. We are going to F. to-morrow; I am so glad. It is frightfully dull to-day, for Hella went away yesterday to Berchtesgaden where she is to stay for 6 weeks, and on the way back she is going to Salzburg and perhaps Aunt Dora will take me to Salzburg for 2 days so that we can see one another again before Hella goes to Hungary. She is lucky! I can't go to K — M — this year, for we are going to stay in F. till the middle of

September. I got my name day presents to-day because they are things for the journey: a black travelling satchel with a black leather belt, and half a dozen mourning handkerchiefs with a narrow black border, and an outfit for pokerwork, and a huge bag of sweets for the journey from Hella. The world is a wretched place without Hella. I do hope we shall marry on the same day, for Mother always used to say: “The most ardent *girl* friendships are always broken up when one of the two marries.” I suppose because the other one is annoyed because she has not married. I wonder what it will be like at Frau Doktor M.’s wedding! and I wonder whether she knows about *everything*; very likely not, but if not I suppose her mother will tell her all about it before she is married. Dora told me yesterday that Mother had once said to her: “A girl always gets all sorts of false ideas into her head; the reality is quite different.” But that is not so in our case, for we really know everything quite precisely, even to the fact that you have to take off every stitch; oh dear, I shall never forget it! — Oswald is coming to F. on the 20th, for first he is going to Munich for a few days.

July 12th. It’s lovely here; mountains and mountains all round, and we’re going to climb them all; oh, how I am enjoying myself! I simply can’t keep a diary; it will have to be a weekary. For I must write to Hella at least every other day. We are staying in the Edelweiss boarding house; there are about 40 visitors, at least that’s what we counted at dinner. There is a visitors’ list hanging up in the hall, and I must study it thoroughly. The journey was rather dull, for Dora had a frightful headache so we could not talk all through the night. I stood in the corridor half the night. At one place in Salzburg there was a frightful fire; no one was putting it out, so I suppose no one knew anything about it. The boarding house is beautifully furnished, carpets everywhere; there are several groups of statuary in the hall. We are awfully pleased with everything. There are 4 courses at dinner and two at supper. Flowers on every table. Father says we must wait and see whether they change them often enough. Father has a new tweed suit which becomes him splendidly for he is so tall and aristocratic looking. We have coats and skirts made of thin black cotton material and black lace blouses, and we also have white coats and skirts and white blouses, and light grey tweed dresses as well. For Father is really quite right: “Mourning is in your *heart*, not in your *dress*.” Still, for the present, we shall wear black, but we have the white things in case it gets frightfully

hot. To-day, on a cliff quite near the house, we picked a great nosegay of Alpine roses. Dora has brought Mother's photo with her and has put the flowers in front of it; unluckily I forgot to bring mine. I should like to go to the top of the Wildeck or one of the other mountains. It would be lovely to pick Edelweiss for oneself. But Father says that mountaineering is not suited to our ages. The baths here always seem very cold, only about 54 or 60 degrees at most. Dr. Klein said we should only bathe when the water is quite warm. But apparently that won't be often. We have not made any acquaintances yet, but I like the look of the two girls wearing Bosnian blouses at the second table from ours. Perhaps we shall get to know them. One plan has come to nothing. I wanted to talk to Dora in the evenings about all sorts of *important* things, but it is impossible because Aunt Dora shares our room. Here's another tiresome thing; Father's room has a lovely veranda looking on to the promenade, while our room only looks into the garden. Of course the view is lovely, but I should have liked Father's room much better, only it is a great deal too small for three persons; there is only one bed and its furniture is of a very ancient order. I do hate that sort of furniture; the lady who keeps the boarding house calls it *Empire!!* I don't suppose she can ever have seen a room furnished in real Empire style.

July 15th. When Dora and I were out for a walk yesterday she told me a great deal about Aunt Dora. I never really knew before whether Uncle Richard was employed in the asylum or whether he was a patient there; but he is a patient. He has spinal disease and is quite off his head and often has attacks of raving madness. Once before he was sent to the asylum he tried to throttle Aunt Dora, and *in another respect* he did her a *frightful lot of harm!!!* I don't quite understand how, for Aunt Dora has never had any children. And why on earth do they make such a secret about Uncle Richard? But when I come to think of it, no one ever wanted to talk about Mother's illness. There's no sense in this secrecy, for in the first place that always makes one think about things, and secondly one always finds out in the long run. At last Aunt Dora was so terribly afraid of Uncle that she always kept the door of her bedroom locked. It must be awful to have a husband who is a raging maniac. Father once said to Dora: your Aunt Dora is enough to drive one mad with her whims and fancies. Of course he didn't mean that literally, but I must watch carefully to find out what Aunt really does to annoy anyone so much. Most likely it is something

connected with *this matter*. To my mind Aunt Alma has many more whims and fancies, and yet Uncle Franz has never gone raving mad. Dora says that Uncle Richard may go on living for another 20 years, and that she is frightfully sorry for Aunt Dora because she is tied to such a monster. Why tied? After all, he is in an asylum and can't do her any harm. Dora didn't know about all this before, Aunt only told her after Mother's death. Dora thinks it is better not to marry at all, unless one is *madly in love* with a man. And then only by a *marriage contract!!* In that case *that* would be excluded. But I always imagined a marriage contract was made because of a dowry and money affairs generally; and never thought of its having *such* a purpose. Frau Mayer, whom we met in the summer holidays two years ago, had married under such conditions. But it puzzles me, for if *that* is what men chiefly want when they marry, I don't see how any man can be satisfied with a marriage contract. There must be a mistake somewhere. Perhaps it is different among the Jews, for the Mayers were Jews.

July 21st. No, I never should have thought that Hella would prove to have been right in that matter. I got a letter 8 pages long from Anneliese to-day. That time when Hella had to stay at home for five days she believed that Anneliese would make fresh advances. But obviously she was afraid. So now she has written to me: My own dear Rita! You are the only friend of my life; wherever I go, all the girls and everybody likes me, and only you have turned away from me in anger. What harm did I do you —— — ? After all, she did do me some harm; for there might have been a fine row if it had not been for Frau Doktor M., that angel in human form! She writes she is so lonely and so unhappy; she is with her mother at the Gratsch Hydropathic near Meran or Bozen, I forget which, I must look it up *if* I answer her. For I gave my word of honour to Hella that I would never forgive the "innocent child." But after all, to write an answer is mere ordinary politeness, and is far from meaning a reconciliation, and still less a friendship. She says that there are absolutely no girls in Gratsch, only grown-up ladies and old gentlemen, the youngest is 32! brr, I know I should find it deplorably dull myself. So I really will write to her, but I shall be exceedingly reserved. She finishes up with: Listen to the prayer of an unhappy girl and do not harden your heart against one who has always loved you truly. That is really very fine, and Anneliese always wrote the best compositions; Frau Doktor M. used often to praise them and to speak of her excellent style, but later she really did not like her at all. She often

told her she ought not to be so affected, or she would lose the power of expression from sheer affectation. I shall not write to her immediately, but only after a few days, and, as I said, with *great* reserve.

July 23rd. I got to know the two girls to-day, their names are Olga and Nelly, one is 15 and the other 13; I don't know their surname yet, but only that they have a leather goods business in Mariahilferstr. Their mother's hair is quite grey already, their father is not coming until August 8th. We have arranged to go for a walk at 4 o'clock this afternoon, to Brennfelden.

July 26th. I have made up my mind to write every day before dinner, for after dinner we all go with our hammocks into the wood. After all I wrote to Anneliese three days ago, without waiting, so as not to keep her on tenterhooks. I have not written anything to Hella about it because I don't know how Anneliese will answer. Hella says she is having a royal time in Innichen; but the tiresome thing does not say just what she means by royal; she wrote only a bare 3 sides including the signature so of course I did not write to her as much as usual.

July 27th. Dora is not very much taken with the Weiners; she thinks they are frightfully stuck up. She says it's not the proper thing to wear gold bracelets and chains in the country, above all with peasant costume. Of course she is right, but still I like the two girls very much, and especially Olga, the younger one; Nelly puts on such airs; they go to a high school too, the Hietzinger High School; but Olga has only just got into the Second while Nelly is in the Fifth. Dora says they will never set the Danube on fire. No matter, leave it to others to do that. We enjoyed ourselves immensely on our walk. I'm going to spend the whole day with them to-day. Father says: "Don't see too much of them; you'll only get tired of them too soon." I don't believe that will happen with the Weiners.

July 29th. It's my birthday to-morrow. I wonder what my presents will be. I've already had one of them before we left Vienna, 3 pairs of openwork stockings, Aunt Dora gave them to me, exquisitely fine, and my feet look so elegant in them. But I must take frightful care of them and not wear them too often. Aunt says: "Perhaps now you will learn to give up pulling at your stockings when you are doing your lessons." As if I would do any lessons in the holidays.

LAST HALF-YEAR, AGE FOURTEEN AND A HALF

LAST HALF-YEAR

July 30th. Thank goodness this is my 14th!!! birthday; Olga thought that I was 16 or at least 15; but I said: No thank you; to *look* like 16 is *quite* agreeable to me, but I should not like to *be* 16, for after all how long is one young, only 2 or 3 years at most. But as to feeling different, as Hella said she did, I really can't notice anything of the kind; I am merely delighted that no one, not even Dora, can now call me a *child*. I do detest the word "child," except when Mother used to say: "My darling child," but then it meant something quite different. I like Mother's ring best of all my birthday presents; I shall wear it for always and always. When I was going to cry, Father said so sweetly: "Don't cry, Gretel, you must not cry on your 14th!! birthday, that would be a fine beginning of *grown-upness!*" Besides the ring, Father gave me a lovely black pearl necklace which suits me perfectly, and is at the same time so cool; then Theodor Storm's *Immensee*, from Aunt Dora the black openwork stockings and long black silk gloves, and from Dora a dark grey leather wristband for my watch. But I shan't wear that until we are back in Vienna and I am going to school again. Grandfather and Grandmother sent fruit as usual, but nothing has come from Oswald. He can't possibly have forgotten. I suppose his present will come later. Father also gave me a box of delicious sweets. At dinner Aunt Dora had ordered my favourite chocolate cream cake, and every one said: Hullo, why have we got a Sunday dish on a weekday? And then it came out that it was my birthday, and the Weiner girls, who knew it already, told most of the other guests and nearly everyone came to wish me many happy returns. Olga and Nelly had done so in the morning, and had given me a huge nosegay of wild flowers and another of cut flowers. This afternoon we are all going to Flagg; it is lovely there.

Evening: I must write some more. We could not have the expedition, because there was a frightful thunderstorm from 2 to 4 o'clock. But we enjoyed ourselves immensely. And I had another adventure: As I was leaving the dining-room in order to go to the . . . ., I heard a voice say: May I wish you a happy birthday, Fraulein? I turned round, and there behind me stood the enormously tall fair-haired student, whom I have been noticing for the last three days. "Thank you very much, it's awfully kind of

you," said I, and wanted to pass on, for I really had to go. But he began speaking again, and said: "I suppose that's only a joke about your being 14. Surely you are 16 to-day?" "I am both glad and sorry to say that I am not, said I, but after all everyone is as old as he seems. Please excuse me, I really must go to my room," said I hurriedly, and bolted, for otherwise —— —— !! I hope he did not suspect the truth. I must write about it to Hella, it will make her laugh. She sent me a lovely little jewel box with a view of Berchtesgaden packed with my favourite sweets, filled with brandy. In her letter she complains of the "shortness of my last letter." I must write her a long letter to-morrow. At supper I noticed for the first time where "Balder" sits; that's what I call him because of his lovely golden hair, and because I don't know his real name. He is with an old gentleman and an old lady and a younger lady whose hair is like his, but she can't possibly be his sister for she is much too old.

July 31st. The family is called Scharrer von Arneck, and the father is a retired member of the Board of Mines. The young lady is really his sister, and she is a teacher at the middle school in Brunn. I found all this out from the housemaid. But I went about it in a very cunning way, I did not want to ask straight out, and so I said: Can you tell me who that white-haired old gentleman is, he is so awfully like my Grandfather. (I have never see my Grandfather, for Father's Father has been dead 12 or 15 years, and Mother's Father does not live in Vienna but in Berlin.) Then Luise answered: "Ah, Fraulein, I expect you mean Herr Oberbergrat Sch., von Sch. But I expect Fraulein's Grandfather is not quite so grumpy." I said: "Is he so frightfully grumpy then?" And she answered: "I should think so; we must all jump at the word go or it's all up with us!" And then one word led to another, and she told me all she knew; the daughter is 32 already, her name is Hulda and her father won't let her marry, and the *young gentleman* has left home because his father pestered him so. He is a student in Prague, and only comes home for the holidays. It all sounds very melancholy, and yet they look perfectly happy except the daughter. By the way, it's horrid for the Weiners; Olga is 13 and Nelly actually 15, and their mother is once more —— —— I mean their mother is in an i — c — . They are both in a frightful rage, and Nelly said to me to-day: "It's a perfect scandal;" they find it so awkward going about with their mother. I can't say I'd noticed anything myself; but they say it has really been obvious for a long time; "*the happy event!!* will take place in October,"

said Olga. It really must be very disagreeable, and I took a dislike to Frau W. from the first. I simply can't understand how such a thing can happen when people are so old. I'm awfully sorry for the two Weiner girls. Something of the same sort must have happened in the case of the Schs., for Luise has told me that the young gentleman is 21 and his sister not 32 but 35, she had made a mistake; so she is 14 years older, appalling. I'm awfully sorry for her because her father won't let her marry, or rather would not let her marry. I'm sure Father would never refuse if either of us wanted to marry. I have written all this to Hella; I miss her dreadfully, for after all the Weiner girls are only strangers, and I could *never* tell my secrets to Dora, though we are quite on good terms now. Oswald is coming to-morrow.

August 1st. A young man has a fine time of it. He comes and goes when he likes and where he likes. A telegram arrived from Oswald to-day, saying he was not coming till the middle of August: Konigsee, Watzmann, glorious tramp. Letter follows. Father did not say much, but I fancy he's very much annoyed. Especially just now, after poor Mother's death, Oswald might just as well come home. Last year he was so long away after matriculation, quite alone, and now it's the same this year. One pleasure after another like that is really not the thing when one's Mother has been dead only three months. The day after we came here and before we had got to know anyone, I went out quite early, at half past 8, and went alone to the cemetery. It is on the slope of the mountain and some of the tombstones are frightfully old, in many cases one can't decipher the inscriptions; there was one of 1798 in Roman figures. I sat on a little bank thinking about poor Mother and all the unhappiness, and I cried so terribly that I had to bathe my eyes lest anyone should notice it. I was horribly annoyed to-day. A letter came from Aunt Alma, she wants to come here, we are to look for rooms for her, to see if we can find anything suitable, Aunt Alma always means by that very cheap, but above all it must be in a private house; of course, for a boarding house would be far too dear for them. I do hope we shan't find *anything* suitable, we really did not find anything to-day, for a storm was threatening and we did not go far. I do so hope we shall have no better success to-morrow; for I really could not stand having Marina here, she is such a spy. Thank goodness Aunt Dora and Dora are both very much against their coming. But Father said: That won't do girls, she's your aunt,

and you must look for rooms for her. All right, we can *look for them*; but seeking and finding are two very different things.

August 2nd. This morning we went out early to look for the rooms, and since Dora always makes a point of finding what's wanted, she managed to hunt up 2 rooms and a kitchen, though they are only in a farm. The summer visitors who were staying there had to go back suddenly to Vienna because their grandmother died, and so the rooms are to let very cheap. Dora wrote to Aunt directly, and she said that we shall all be delighted to see them, which is a downright lie. However, I wrote a P.S. in which I sent love to them all, and said that the journey was scandalously expensive; perhaps that may choke them off a bit. Owing to this silly running about looking for rooms I saw nothing of the Weiners yesterday afternoon or this morning, and of course nothing of God Balder either. And at dinner we can't see the Scharrers' table because they have a table in the bay window, for they have come here every year for the last 9 years. I'm absolutely tired out, but there's something I must write. This afternoon the Weiners and we went up to Kreindl's, and Siegfried Sch. came with us, for he knows the Weiners, who have been here every year for the last 3 years. He talked chiefly to Dora, and that annoyed me frightfully. So I said not a word, but walked well behind the others. On the way home he came up to me and said: "I say, Fraulein Grete, are you always so reserved? Your eyes seem to contradict the idea." I said: "It all depends on my mood, and above all I hate forcing myself on any one." "Could you not change places at table with your mother?" "In the first place, she is not my Mother, who died on April 24th, but my Aunt, and in the second place, why do you say that to *me*, you had better say it to my sister!" "Don't be jealous! There's no reason for *that*. I can't help talking to your sister when we're in company; but I can assure you that you have no occasion whatever to be jealous." I wish I knew how I could manage that change of places, but I always sit next Father; anyhow I would not do it directly; next week at soonest. Farewell, my Hero Siegfried, sleep sweetly and dream of —— .

August 3rd, Anneliese wrote to me: "You heart of gold, so you are able to forgive my sins of youth? The world shines with a new light since I received your letter." I don't know that my letter was so forgiving as all that, for all I said was that I was very sorry she was so lonely in Gratsch, and that we could not alter the past, so we had better bury it. She sends me a belated birthday greeting (last winter we told one another when our

birthdays were), and she sends me a great pressed forget-me-not. She waited to answer until it had been pressed. I don't know quite what I had better do. Big Siegfried could no doubt give me very good advice, but I can't very well tell him the whole story, for then I should have to tell him why we quarrelled, and that would be awful. I had better write to Hella before I answer. I must write to-day, for it will be quite three days before I can get an answer, and then 1 or two days more before Anneliese gets the letter, so that will be 5 days at least. It is raining in torrents, so it is very dull, for Father won't let us sit in the hall alone; I can't think why. Generally speaking Father's awfully kind, quite different from other fathers, but this is really disgusting of him. I shall lie down on the sofa after dinner and read *Immensee*, for I've not had a chance before.

August 6th. Well, the whole tribe arrived to-day; Marina in a dust-grey coat and skirt that fits her abominably, and Erwin and Ferdinand; Ferdinand is going through the artillery course in Vienna, at the Neustadt military academy; he's the most presentable of the lot. Uncle was in a frightful temper, growling about the journey and about the handbaggage, I think they must have had 8 or 10 packages, at least I had to carry a heavy travelling rug and Dora a handbag of which she said that it contained the accumulated rubbish of 10 years. Aunt Alma's appearance was enough to give one fits, a tweed dress kilted up so high that one saw her brown stockings as she walked, and a hat like a scarecrow's. When I think how awfully well dressed *Mother* always was, and how nice she always looked; of course Mother was at least 20 years younger than Aunt Alma, but even if Mother had lived to be 80 she would never have looked like *that*. Thank goodness, on the way from the station we did not meet any one, and above all we did not meet *him.* For once in a way they all came to dinner at our boarding house. We had two tables put together, and I seized the opportunity to change my place, for I offered Aunt Alma the place next Father and seated myself beside the lovely Marina, exactly opposite ——— ! Anyway, Marina looked quite nice at dinner, for her white blouse suits her very well, and she has a lovely complexion, so white, with just a touch of pink in the cheeks. But that is her only beauty. The way she does her hair is hideous, parted and brushed quite smooth, with two pigtails. I've given them up long ago, though everyone said they suited me very well. But "snails" suit me a great deal better. *He* looked across at me the whole time, and Aunt Alma said: "Grete is blossoming out, I hope there's not a

man in the case already." "Oh no," said Father, "country air does her such a lot of good, and when I take the children away for a change I don't forbid any innocent pleasures." My darling Father, I had to keep a tight hand on myself so as not to kiss him then and there. They were all so prim, with their eyes glued to their plates as if they had never eaten rum pudding before. It is true that Ferdinand winked at Marina, but of course she noticed nothing. They soon put away their first helps, and they all took a second, and then they went on talking. When we went to our rooms I knocked at Father's door and gave him the promised kiss and said: "You really are a jewel of a Father." "Well, will you, if you please, be a jewel of a daughter, and keep the peace with Marina and the others?" I said: "Oh dear, I simply can't stand her, she's such a humbug!" "Oh well," said Father, "it may be a pity, but you know one can't choose one's parents and one's relations." "I would not have chosen any different parents, for we could not have found another Father and another Mother like you." Then Father lifted me right up into the air as if I had still been a little girl, saying: "You are a little treasure," and we kissed one another heartily. I really do like Father better than anyone in the world; for the way I like Hella is quite different, she is my friend, and Dora is my sister; and I like Aunt Dora too, and Oswald *if* I ever see him again.

August 8th. Oh, I am so furious! To-day I got a postcard from Hella, with nothing on it but "Follow your own bent, with best wishes, your M." When we write postcards we always use a cipher which no one else can understand, so that M. means H. It's a good thing no one can understand it. Of course I wrote to Anneliese directly, and was most affectionate, and I sent a postcard to Hella, in our cipher, with nothing more than: Have done so, with best wishes, W. Not even *your* W. I do wonder what she will do. Hero Siegfried was lying with us to-day in the hayfield, and what he said was lovely. But I can't agree that all fathers *without exception* are tyrants. I said: "*My* Father isn't!" He rejoined: "Not *yet*, but you will find out in time. However, anyone with a character of his own won't allow himself to be suppressed. I simply broke with my Old Man and left home; there are other technical schools besides the one in Brunn. And since you say not *all* fathers; well just look at Hulda; whenever anyone fell in love with her the Old Man marred her chance, for no one can stand such tutelage." "Tutelage, what do you mean," said I, but just at that moment everyone got up to go away. To-morrow perhaps, poor persecuted man.

August 9th. Oh dear, it's horrible if it's all really true what Hella writes about being infected; an eruption all over the body, that is the most horrible thing in the world. I must tear up her letter directly, and since she could not write 8 whole pages in our cipher, I must *absolutely destroy* it, so that no one can get hold of a fragment of it. Above all now that Marina is here, for you never can tell ——— — . But I know what I'll do; I'll copy the letter here, even if it takes 2 or 3 days. She writes:

Darling Rita, what did you say when you got yesterday's postcard. If you were angry, you must make it up with me. Consort with whom you please and write to whom you please; but all the *consequences* be on your own head. Father always says: Beware of red hair! And I insist that the "innocent child" has *foxy red* hair. But you can think what you like.

Now I've got something much more important to tell you. But you must promise me dirst that you will tear up my letter directly you have read it. Otherwise please send it back to me *un*read.

Just fancy. Here in B. there is a young married woman living with her mother and her cousin, a girl who is studying medicine; they are Poles and I have always had an enthusiastic admiration for the Poles. The young wife has got a divorce from her husband, for she was *infected* by him on the *wedding night*. Of course you remember what being *infected* is. But really it is something quite different from what we imagined. Because of *that* she got a frightful eruption all over her body and her face, and most likely all her hair will fall out; is it not frightful? Her cousin, the medical student, who is apparently very poor, is there to *nurse* her. Our servant Rosa told me about it, she heard of it from the housemaid where they have rooms. As you know, one can't talk to Lizzi about anything of that kind, and so I did not learn any more; but the other day, when I went to buy some picture postcards, I met the three ladies. The young wife was wearing a very thick veil, so that one could see nothing. They were sitting on a bench in the garden in front of their house, and I bowed in passing, on the way back. They bowed, and smiled in a friendly way. In the afternoon I had to lie down, for I was feeling very bad because of . . . .!! Then I suddenly heard some people talking on the veranda just outside my window — the veranda runs all round the house. At first I saw shadows passing, and then they sat down outside. I recognised the soft voice of the Polish student directly, and I heard her say to the wife of the mayor of J.: "Yes, my unfortunate cousin's experience has been a terrible one; that is because

people sell girls like merchandise, without asking them, and without their having the least idea what they are in for." I got up at once and sat down close to the window behind the curtain so that I could hear everything. The mayor's wife said: "Yes, it's horrible what one has to go through when one is married. *My* husband is not one of that sort but —— —" And then I could not understand what she went on to say I overheard this conversation on Thursday. But that's not all I have to tell you. Of course my first thought was, if only I could have a talk with her; for she spoke about *enlightenment* and although we are both of us already *very much enlightened*, still, as a medical student, she must know a great deal more than we do, so that we can learn from her. And since she said that girls ought not to be allowed to *run blindly into marriage*, I thought she would probably tell me a little if I went cautiously to work. There was a word which she and the mayor's wife used more than once, *segsual* and I don't know what it means, and I'm sure you don't know either, darling Rita. She said something about *segsual intimacies*; of course when people talk about *intimacies*, one knows it has a meaning, but what on earth does segsual mean? It must mean something, since it is used with *intimacy*. Well, let me get on. On Saturday there was a party, and the medical student came, and I left my Alpine Songs lying on the piano, and somebody picked it up and turned over the pages, and the word went round that the person to whom it belonged must sing something. At first I did not let on, but went out for a moment, and then came back saying: "I'm looking for my music book, I left it lying about somewhere." There was a general shout, and everyone said: "We've agreed that the person to whom that book belongs has got to sing." Now I knew that Fraulein Karwinska had accompanied the singing on such evenings before. So I said: "I shall be delighted to sing, provided Fraulein K. will accompany me, For you gentlemen play too loud for my voice." Great laughter, but I had got what I wanted. We were introduced, and I thought to myself: You will soon improve the acquaintance. On Sunday for once in a way I got up quite early, at half past 6, for Fraulein K. can only go out walking early in the morning since she spends the whole day with her cousin. She sits near the Luisenquelle, so I went there with a book, and as soon as she came I jumped up, said "good-morning," and went on: "I'm afraid I've taken possession of *your* bench." "Not at all," she said, "Do you study on Sundays?" "Oh no, this is only light reading," I answered, and I made haste to sit on the book, for in my hurry I had not

noticed what it was. But luck was with me. She sat down beside me and said: “What is it you are reading that you hide so anxiously? I suppose it’s something that your mother must not know about.” “Oh no,” said I, “we have not brought any such books to the country with us.” “I take it that means that you do manage to get them when you are in town?” “Goodness me, one must try and learn a little about *life*; and since no one will ever tell one anything, one looks about for oneself to see if one can find anything in a book.” “In the encyclopedia, I suppose?” “No, that’s no good, for one can’t always find the truth there.” She burst out laughing and said: “What sort of truth do you want?” “I think you can imagine very well what sort of things I want to know.” Of course one can speak more plainly to a medical student than one can to other girls, and she was not in the least disgusted or angry but said: “Yes, it’s the same struggle everywhere.” Then I made use of your favourite phrase and said: “Struggle, what do you mean? What I really want to know about is being infected.” Then she flushed up and said: “Who’s been talking to you about that? It seems to me that the whole town is chattering about my unhappy cousin. You must see that *I* can’t tell you that.” But I answered: “If you don’t, who will? *You* study medicine, and are seeing and talking about such things all day.” “No, no, my dear *child* (you can imagine how furious that made me), you are still much too young for *that sort of thing*.” What do you think of that, we are too young at 14 1/2, it’s utterly absurd. I expect that really her studies have not gone very far, and she would not admit it. Anyhow, I stood up, and said: “I must not disturb you any longer,” and bowed and went away; but I thought to myself: “A fig for her and her *studies*; fine sort of a doctor *she*’ll make!” What do you think about it all? We shall still have to trust to the encyclopedia, and after all a lot of what we can learn there is all right, and luckily we know most things except the word segsual. Next winter I expect we shall find it easier than we used to to get to the bookcase in your house. I don’t bow to the silly idiot any more.

But darling Rita, with regard to the “innocent child,” I don’t want to influence you in any way, and I shan’t be angry with you for preferring an *unworthy* person to me!!! Faithless though you are, I send you half a million kisses, your ever faithful friend, H. P.S. I have been 4 days writing this letter; tear it up, *whatever* you do!!!

Now that I have copied the letter, I really can’t see why Hella wants me to tear it up. There’s nothing so very dreadful in it. But there is one thing I

shan't be able to do for Hella, to help her in looking up things in the encyclopedia. I think I should always feel that Mother would suddenly come in and stand behind us. No, I simply can't do it.

August 13th. Through that stupid copying I have been prevented writing about *my own* affairs, although they are far more important. Last Wednesday the Society for the Preservation of Natural Beauties had arranged a great excursion to Inner-Lahn in breaks. Dora did not want to go at first, but Father said that if it would give *us* pleasure, he would very much like to go with us, and Mother would be only too delighted to see that we were enjoying something once more. And two days before the excursion Dora finally decided that she would like to go; I knew why at once; she thought that by that time all the places would have been taken, and that we should have been told: Very sorry, no more room. But luckily she had made a *great* mistake. For the secretary said: With pleasure; how many places shall I reserve? and so we said: 7; namely, Father, Dora, and I, Aunt Alma (unfortunately), Marina (very unfortunately), and the two boys (no less unfortunately). "That will need an extra conveyance," replied the secretary, and we thought we should make a family party. But it was not so: Next Dora sat a gentleman whom I had seen once or twice before, and he paid her a tremendous amount of attention. Besides that there were 2 strange gentlemen, Frau Bang and her 2 daughters and her son, who is not quite all there; opposite was Hero Siegfried, a young lady who is I believe going on the stage, the two Weiner girls and their Mother (notwithstanding!!!), then I, and afterwards Marina, Father, Aunt Alma, and the two boys opposite. I don't know who made up the other break-loads. At 6 in the morning we all met outside the school, for the schoolmaster acted as our guide. I did not know before that he has two daughters and a son who has matriculated this year. First of all they held a great review, and the gentlemen fortified themselves with a nip and so did some of the ladies; I did not, for I hate the way in which a liqueur burns one's throat so that every one, at any rate girls and ladies, make such faces when they are drinking, that is why I never drink liqueur. I did not care much about the drive out, for it was very cold and windy, most of us had red noses and blue lips; I kept on biting my lips to keep them red, for one looks simply hideous when one's lips are white or blue, I noticed that in Dora when we were skating last winter. Father went only on our account, and Aunt Dora stayed at home so that Aunt Alma could go. Marina wears

“snails” now, the sight of her is enough to give one fits. Dora gets on with her quite well, which is more than I can say for myself. Only when we got out aid I notice that Siegfried’s sister, Fraulein Hulda, had been sitting next the aspiring actress. She is awfully nice, and many, many years ago she must have been very pretty; she has such soft brown eyes, and her hair is the same colour as her brother’s; but he has glorious blue eyes, which get quite black when he is angry, as he was when he was talking about his father. I should tremble before him in his wrath. He is so tall that I only come up to his shoulder. Father calls him the red tapeworm; but that’s really not fair. He is very broad but so thin. In Unter-Toifen we stopped for breakfast, eating the food we had brought with us; about half an hour; then the schoolmaster hurried us all away, for we had quite 10 miles to walk. The two boys made a party with other boys, and we five girls, we 2, the 2 Weiners, and Marina, led the way. Aunt Alma walked with a clergyman’s wife from Hildesheim, or whatever it was called, and with the schoolmaster’s wife. It was *awfully* dull at first, so that I began to be sorry that I had begged Father to let us go. But after we had gone a few miles the schoolmaster’s son and three bright young fellows came along and walked with us. Then we had such fun that we could hardly walk for laughing, and the elders had continually to drive us on. Marina was quite unrestrained, I could never have believed that she could be so jolly. One of the schoolmaster’s daughters fell down, and some one pulled her out of the brook into which she had slid because she was laughing so much. I really don’t know what time we got to Inner-Lahn, for we were enjoying ourselves so much. Dinner had been ordered ready for us, and we were all frantically hungry. We laughed without stopping, for we had all sat down just as we had come in, although Aunt Alma did not want us to at first. But she was outvoted. I was *especially pleased* to show Hero Siegfried that I could amuse myself very well without him, for he had frozen on to the aspiring actress, or she had frozen on to him — I don’t know which, or at least I did not know *then!* Since we were sitting all mixed up everyone had to pay for himself, and Father said next day we had spent a perfect fortune; but that was not in the hotel, it happened later, when we were buying mementoes. And I think Dora gave Marina 3 crowns, so that she could buy some things too. But Dora never lets on about anything of that sort. I must say I like her character better and better; in those ways she is very like Mother. Well, our purchases were all packed into two or three rucksacks,

and were kept for a raffle in Unter-Toifen on the way back. I must have spent at least 7 crowns, for Father had given each of us 5 crowns before we started, and I still had a lot of my August pocket money left, and now I've got only 40 hellers. After we had had dinner and bought the things we lay about in the forest or walked about in couples. I had curled myself up for a nap when some one came up behind me, and when I sat up this *someone* put his hands over my eyes and said: "The Mountain Spirit." And I recognised *his* hands *instantly*, and said: "Hero Siegfried!" Then he laughed like anything and sat down beside me and said: "You were enjoying yourself so much this morning that you had not even a glance to spare for me." "Contrariwise (I've got that from Dora), I never foist myself on anyone, and never *hang around anyone's neck*." Then he wanted to put his arm round my waist (and probably, most probably, he would have kissed me), but I sprang to my feet and called Dora or rather Thea, for before the gentlemen we pretend that we never call one another anything but Thea and Rita. Father says that that is awfully silly, and no longer suitable for Dora (but of course it was alright for me!), but we keep to our arrangement. Then he raised my hand to his lips and said: "Don't call!" But Dora came up, and with her the gentleman with the pincenez, who is a doctor of law belonging to the District Court of Innsbruck, and Marina and one of the young men, and I asked, "I say, when *are* we going to have tea?" "Just fancy, she is hungry again already," they all said, and laughed like anything. And Dora looked *frightfully* happy. She was wearing an edelweiss buttonhole which she had not been wearing before; in the evening she told me that Dr. P. had given it her. If possible he is even taller than Hero Siegfried, for Dora is taller than I am and her head only comes up to his ear. At 3 o'clock the last party came up to the belvedere, we had got there earlier. The view was lovely. But I must say I can enjoy a fine view much better when I am alone, that is with Father or quite a few persons; it is no good when there's such a crowd; each additional person seems to take something more away. In a lovely place and at the cemetery one must be alone. For a beautiful view usually makes one feel frightfully sad, and one ought not to have been laughing so much just before, or laugh directly afterwards. If I were alone in Inner-Lahn I'm sure I should become melancholy, for it is so gloriously beautiful there.

At 4 o'clock, after tea, we started back, for the schoolmaster thought the descent would not take more than two hours and a half, but we needed

more than three. For we were all very tired, and a great many of them had sore feet, especially Aunt Alma! We had said before, that it would be too much for Aunt; but she had to come with us to take care of Marina, though Marina enjoyed herself *extremely* with a Herr Furtner, who is studying mining like Oswald, not in Leoben but in Germany. One does not really find out what a girl is like until one sees how she behaves with a man, or what she is like when one talks to her about *certain things*; as for the last, of course that's impossible with Marina *since the experience* we had. But anyhow she is nicer than one would have thought at first sight. It was lovely on the way home. Driving back from Unter-Toifen we sat quite differently.

In our break, instead of the Weiners, there were three students from Munich, they were awfully nice, and we sang all the songs we knew; especially "Hoch vom Dachstein, wo der Aar nur haust," and "Forelle" and "Wo mein Schatz ist," were lovely, and the people in two different breaks sang together. And then some of them sang some Alpine songs and yodelled till the hills echoed. Two or three of the men in the third break were rather tipsy and *Hero Siegfried!!* was one of them. Aunt Alma had a frightful headache; it was utterly idiotic for her to come, and we did not know yet what was still to happen. At every house from which a girl had come there was a serenade. And next evening there was to be a great raffle of the mementoes we had bought, but Father would not let us go to that.

August 14th. It is desperately dull. I don't know what on earth to do, so I am writing my diary. Besides, I have not written about the row yet. The next afternoon Aunt Alma came just as we were going out and said to Father: Ernst, please let me have a word with you. Now we all know Aunt Alma's *let me have a word with you*. In plain language it means: I'm going to make a scene. She began: "Ernst, you know I never like these big parties with a lot of strangers, for no good can come of them. Still, I made up my mind to go for the sake of the children, and chiefly for the sake of *your motherless* children. (Nobody asked her to; and Aunt Dora had to stay at home on her account.) Do you know what sort of people were in our company? That impudent young student whom Gretel is always running after (did you ever hear anything like it! I should like to know when I ran after him; I suppose in the wood I put *my* arm round *his* waist, and I suppose that it was *I* who began the acquaintance on my birthday) and that girl who's training for the stage did not come home after the excursion till

the night was half over. God knows where they were! They were certainly no *cleaner* when they got home. (Naturally, for where could they have had a wash.) His father gave the young blackguard a fine talking to, but of course the girl's mother takes her side. It would positively kill me to think of *my Marina doing anything of the kind*." Father was able to get a word in at last: "But my dear Alma, what has all this to do with my girls? As far as I know these two people weren't in our break, isn't that so girls?" I was glad that Father turned to *us*, and I said: "Siegfried Sch. and the girl drove in the fourth break, I saw them getting in. And it was toute meme chause where he drove and with whom he was driving." (Of course that's not true, but I said it was because of Aunt.) "Such language and such a tone to your own Father!" Directly she said that Father was in such a passion as I have never seen him in before. "My dear Alma, I really must beg you not to interfere with *my* educational methods, any more than I ever attempt to interfere in *your* affairs." Father said this quite quietly, but he was simply white with rage, and Dora told me afterwards that I was quite white too, also from rage of course. Aunt Alma said: "I don't want to prophesy evil, but the future will show who is right Goodbye." As soon as she had gone Dora and I rushed to Father and said: "Please Father, don't be so frightfully angry; there's no reason why you should." And Father was awfully sweet and said: "I know quite well that I can trust you; you are my Berta's children." And then I simply could not contain myself, and I said: "No, Father, I really did flirt with Siegfried, and in the wood he put his arm round my waist; but I did not let him kiss me, I give you my word I did not. And if you want me to I'll promise never to speak to him again." And then Father said: "Really, Gretel, you have plenty of time yet for such affairs, and even if that *red-haired rascal* plays the gallant with you, he is only making himself a laughing-stock. And you don't want that, do you, little witch?" Then I threw my arms round Father and promised him *on my word of honour* that I would never speak to Siegfried again. For it really distresses me very much that he should make himself ridiculous; and that he should go out walking half the night with that girl; such shamelessness!

We were so much upset that we did not go for a walk, and of course did not go to the raffle. But I'm frightfully sorry about those things I paid 7 crowns for. I do hope he did not win any of them.

August 15th. Just a few words more. Early this morning, as I was going to breakfast, in the corridor I met S. (it's a good thing that is the initial

both of his name and of Strick [rascal] as Father called him) and he said: “Good morning, Fraulein Gretchen. Why weren’t you at the raffle? Hadn’t you any share?”— “Oh yes, I had bought 7 crowns worth for it, but I had no fancy for the company I should meet.” —— Why, what has taken you all of a sudden? They were the same people as at the excursion! —— — “Precisely for that reason,” said I, and passed on. I think I gave him what for, for he simply must have understood. Father is really quite right, and it is not at all nice to abuse one’s parents to strangers as he is always doing. I could not say a word against my parents to anyone, although I’m often frightfully angry with them; of course not about Mother, for she is dead. But not even about Father; I would rather choke down the greatest injustice. For when we had that trouble with Aunt Alma about Marina, I was really not in the least to blame, but he scolded me so, even while Aunt Alma was there, so that I can never forget it. But still, to a stranger, to some one whom I had only just got to know, I would never say a word against anyone in our family; though I used to get on so badly with Dora, I never said much against her even to Hella; at most that she was deceitful, and that really used to be so, though she seldom is now.

August 19th. It is so filthyly dull here; I can’t bear the word filthy, but it’s the only one that’s strong enough. Oswald is coming this evening, at last. Thank goodness. S. has made several *advances*, but I have *ignored* them. Let him stick to his actress who can go out walking with him half the night. I really *should* like to know where they went. In the night, I never heard of such a thing! Dora says she took a dislike to S. from the first because he —— —— — it’s an absolute lie! —— — has clammy! hands. It’s simply not true, on the contrary he has such entrancingly cool hands, I’m sure I must know that better than Dora. But I’ve known for a long time that whenever anyone pays *me* attention Dora is *unsympathetic*, naturally enough. By the way, on Sunday I got a charming letter from Anneliese. I must answer it to-day.

August 22nd. Oswald is awfully nice. He did not forget my birthday, but he says that at that time he was stoney, in student’s slang that means that he hadn’t any money, and then he could not find anything suitable, but that he will repair the omission as soon as we get back to Vienna. But I don’t know what I should like. Oswald is going to stay until we all go back to Vienna, and we are making a few excursions *by ourselves*. That is really the best way after all. I am not much with the Weiners now, for we had a

little tiff on the big excursion. But Nelly is rather taken with Oswald, so she came twice to our table to-day, once about a book we had lent her, and once to arrange for a walk.

August 24th. It is really absurd that one's own brother can think such a lot of one; but if he does, I suppose he knows. Oswald said to me to-day: "Gretl, you are so smart I could bite you. How you are developing." I said: "I don't want anyone to bite me," and he said: "Nor do I," but I was awfully delighted, though he is only my brother. He can't stand Marina, and as a man he finds Dora too stupid; I think he's right, really. And I simply can't understand Dr. P., that he can always find something to talk about to Dora. He has hardly said 10 words to me yet. Still, I don't care.

August 27th. We went up the Matscherkogel yesterday, and we had a lovely view. The two boys came, for they had begged their father to let them; but of course Aunt Alma and Marina did not come. Oswald calls Aunt Alma *Angular Pincushion*, but only when Father isn't there, for after all she is Father's sister. The Weiners wanted to come too, but I said that my brother was staying only a few days more, and that this was a "farewell excursion *en famille*." They were rather hurt, but they have made me very angry by the way in which they will go on talking about S. in front of me, on purpose, saying that he is engaged or is going to be engaged to the actress girl against his father's will. What does it matter to *me*? They keep on exchanging glances when they say that, especially Olga, who is really rather stupid. I am so sad now at times that I simply can't understand how I could have enjoyed myself so much on the big excursion. I'm always thinking of dear Mother, and I often wear my black frock. It suits my mood better.

August 30th. I believe the Schs. are leaving to-morrow. At least the old gentleman said to Father the day before yesterday: "Thank the Lord, we shall soon be able to enjoy the comforts of home once more." That is what Hella's grandmother used to say before they came back from the country. And to-day I saw two great trunks standing in the passage just outside Herr Scharrer's room. Oswald thinks the old gentleman charming; well, there's no accounting for tastes. I don't believe he's ever spoken to S., though he is a German Nationalist too, but of a different section; Oswald belongs to the Sudmark, and S. abused that section frightfully when I told him that Oswald belonged to the Sudmark.

August 31st. He has really gone to-day, that is, the whole family has gone. They came to bid us goodbye yesterday after supper, and they left this morning by the 9 o'clock train to Innsbruck. And his hands are not clammy, I paid particular attention to the point; it is pure imagination on Dora's part. He and Oswald greeted one another with Hail! That's a splendid salutation, and I shall introduce it between Hella and me.

September 2nd. The Weiners left to-day too, because people are really beginning to stare at their mother too much. When Olga said goodbye to me she told me she hated having to travel with her mother and whenever possible she would lag behind a little so that people should not know they belonged together.

September 4th. I never heard of such a thing!! S. has come back, alone of course. Everyone is indignant, for he has only come back because of Fraulein A., the actress girl. But Oswald defends him like anything. This afternoon Frau Lunda said to Aunt Dora: "It's simply scandalous, and his parents certainly ought not to have allowed him to come, even if the girl's mother does not know any better." Then Oswald said: "Excuse me, Frau Lunda, Scharrer is no longer a schoolboy who must cling to his mother's apron-string; such tutelage would really be unworthy of a full-grown German." I was so pleased that he gave a piece of his mind to Frau L., for she is always glaring at one and is so frantically inquisitive. And *tutelage* is such an impressive word, S. used it once when he was speaking of his sister and why she had never married. Frau L. was furious. She turned to Aunt Dora and said: "Young men naturally take one another's part, until they are fathers themselves and then they hold other views."

September 8th. Thank goodness we are going home the day after to-morrow. It really has been rather dull here, certainly I can't join in the paean Hella sang about the place last year; of course they were not staying in the Edelweiss boarding house but in the Hotel Kaiser von Oesterreich. It makes a lot of difference *where* one is staying. By the way, it has just occurred to me. The young wife who had the eruption after *infection* can't have been divorced, as Hella wrote me the week before last; for her husband has been there on a visit, he is an actor at the Theatre Royal in Munich. So it would seem that actors really are all *infected*; and Hella always says it is only officers! She takes rather an exaggerated view.

September 14th. We have been back in Vienna since the 11th, but I have been absolutely unable to write, though there was plenty to write about.

For the first person I met when I went out on the 11th to fetch some cocoa which Resi had forgotten, was Lieutenant R. Viktor, *the Conqueror!!* Of course he recognised me immediately, and was awfully friendly, and *walked with me a little way*. He asked casually after Dora, but it is obvious that he is not in love with her any more. And it was so funny that he should not know that Dora had matriculated this year and so would not be going to the High School any more. I did not tell him that she intends to go on with her studies, for it is not absolutely settled yet.

September 16th. Hella came home yesterday; I am so glad; I greeted her with: *Hail!* but she said; "don't be silly," besides, it's unsuitable for an Austrian officer's daughter!!! Still, we won't quarrel about it after 2 months' separation, and *Servus* is very smart too though not so distinguished. She told me a tremendous lot more about that young married woman; some of the ladies in B. said that her cousin was *in love* with the husband. That would be awful, for then she would get infected too; but Hella says she did not notice anything, though she watched very closely during the fortnight he was there. He sang at two of the musical evenings, but she did not see any sign of it. Lizzi is *engaged*, but Hella could not write anything about it, for the engagement is only being officially announced now that they are back in Vienna; her fiance is Baron G. He is an attache in London, and she met him there. He is madly in love with her. In August he was on leave, and he came to B. to make an offer of marriage; that is why they stayed the whole summer in B. instead of going to Hungary. Those were the *special circumstances*, about which Hella said she could not write to me. I don t see why she could not have told me *that*, I should have kept it to myself; and after all, Lizzi is 19 1/2 now, and no one would have been surprised that she is engaged at last. They can't have a great betrothal party, for Baron G.'s father died in July. Hella is very much put out. Lizzi says it does not matter a bit.

September 18th. Lizzi's betrothal cards arrived to-day. It must be glorious to send out betrothal cards. Dora got quite red with annoyance, though she said when I asked her: "Why do you flush up so, surely there's no reason to be ashamed when anyone is *engaged!*" "Really, why should you think I am ashamed, I am merely *extremely surprised*." But one does not get so red as *that* from surprise.

September 19th. School began to-day; unfortunately, for *she* has gone. And what was the Third is now the Fourth, and that is detestable, to sit in

the classroom without *her*. Luckily we have Frau Doktor St. as class mistress, and she is to teach us mathematics and physics once more; Frau Doktor F., whom we used to call Nutling and the Fifth used to call Waterfall has gone, for she has been appointed to the German High School in Lemberg. For the time being we are sitting in our old place, but Hella says we must ask Frau Doktor S. to let us have another seat, for the memory of the three years when we had Frau Doktor M. might make us inattentive. That is a splendid idea. In German we have a master, in French I am sorry to say it's still Frau Doktor Dunker, whose complexion has not improved, and in English the head mistress. I am very pleased with that, for first of all I like her very much, and secondly I shall be in her good books from the start because Dora was her favourite. Of course I'm not learning Latin, for it would not interest me now that Frau Doktor M. has gone. Oh, and we have a new Religion teacher, for Herr Professor K. has retired, since he was 60 already.

September 21st. We have managed it. In the long interval, Hella said to Frau Doktor St., who was in charge. "Frau Doktor, may we venture to ask for something?" So she said: "What, in the very first week; well, what is it?" We said we should like to move from the third bench towards the window, for we found it very painful to go on sitting where we had sat when Frau Doktor M., was there. At first she refused, but after a while she said: "I'll see what I can do, if you are really not happy where you are." From 11 to 12 was the mathematic lesson, and as soon as Frau Doktor Steiner had taken her place she said: "This arrangement of your seats was only provisional. You had better sit more according to height." Then she rearranged us all, and Hella and I were moved to the 5th bench on the window side; the two twins, the Ehrenfelds got our places; in front of us is Lohr and a new girl called Friederike Hammer whose father is a confectioner in Mariahilferstrasse. We are awfully glad that we have got away from that hateful third bench where *she* used so often to stand near us and lay her hand on the desk.

September 29th. Professor Fritsch, the German professor, came to-day for the first time. He is always clearing his throat and he wears gold spectacles. Hella thinks him *tolerably* nice, but I don't. I'm quite sure that I shall never get an Excellent in German again. Yesterday the new Religion master came for the first time, and I sat alone, for Hella being a Protestant did not attend. He looks frightfully ill and his eyes are always lowered

though he has burning black eyes. Next time I shall sit beside Hammer which will be company for us both.

October 2nd. We had confession and communion to-day, and since the staff will not allow us to choose our confessors, I had to go to Professor Ruppy. I did hate it. I whispered so low that he had to tell me to speak louder three times over. When I began about the sixth commandment he covered his eyes with his hand. But thank goodness he did not ask any questions about that. The only one of the staff who used to allow us to choose our confessors was Frau Doktor M. Really, she did not allow it directly but when one ran quickly to another confessional box, she pretended not to notice. The Herr Rel. Prof gives frightfully long penances; all the girls who went to him took a tremendous time to get through. I do hope he won't be so strict over his examinations or I shall get an Unsatisfactory; that would be awful. October 3rd. Father was so splendid to-day! Aunt Dora must have told him that I asked her not long ago whether Father was likely to marry Frau Riedl, whose husband died almost exactly the same time as Mother, for Father is guardian to her three children. She was here to-day with Willi, because he has just begun going to school. Dora and I talked it over, and she said that if Father married Frau R., she would leave home. In the evening when we were at supper, I said: "If only Frau v. R. was not so ugly. Father, don't you think she's perfectly hideous? And Father laughed so lovingly and said: You need not be anxious, little witch, I'm not going to inflict a stepmother on you." I was so glad, and so was Dora and we kissed Father such a lot, and Dora said: "I felt sure that you would never break your oath to Mother," and she burst out crying. And Father said: "No, girls, I did not give any promise to your Mother, she would never have asked anything of the kind. But with grown girls like you it would never do to bring a stepmother into the house." And then I told Father that Dora would have gone away from home, and as for me, I should certainly have been frightfully upset. For *if* Father really wanted *to marry* again *I* should have to put up with it; and so would Dora. But Father said once more: "Don't worry, I certainly shan't marry again." And I said: "Not even Aunt Dora?" And he said: "Oh, as for her — —" And then he pulled himself up and said: "No, no, not even Aunt Dora." Dora has just told me that I am a perfect idiot, for surely I must know that Father is not particularly charmed by Aunt. And then she blamed me for having told Father that she would leave home if he were to

marry again. *I am a child* to whom it is impossible to entrust any secrets!! Now we have been quarrelling for at least three quarters of an hour, so it is already half past 11. Luckily to-morrow is a holiday, because of the Emperor's birthday. But I am so glad to know for certain that Father is not going to marry Frau v. R I could never get on with a stepmother.

October 9th. It's horribly difficult in German this year. In composition we are not allowed to make any rough notes, we have to write it straight off and then *hand it in*. I simply can't. Professor Fritsch is very handsome, but the girls are terribly afraid of him for he is so strict. His wife is in an asylum and his children live with his mother. He has got a divorce from his wife, and since he has the luck to be a Protestant he can marry again if he wants to. Hella is perfectly fascinated by him, but I'm not in the least. For I always think of Prof. W. in the Second, and that's enough for me. I'm not going to fall in love with any more professors. In the Training College, where Marina is now, in her fourth year one of the professors last year married a former pupil. I would not do that at any price, marry a former professor, who knows all one's faults. Besides, he must be at least 12 or 20 years older than the girl; and that's perfectly horrible, one might as well marry one's father; he would be at least fond of her, and she would at least know the way he likes to have everything done; but to marry one's former professor, what an extraordinary thing to do!

October 15th. I'm frightfully anxious that Hella may have a relapse; she says that nothing would induce her to have a second operation, especially now that —— — ; she says she would rather die. That would be awful! I did my best to persuade her to tell her mother that she has such pain; but she won't.

October 19th. In November, Hella's father will be made a general and will be stationed in Cracow. Thank goodness she is going to stay here with her grandmother until she leaves the Lyz. She will only go to Cracow at Christmas and Easter and in the summer holidays. She is frantically delighted. The good news has made her quite well again. Everyone at school is very proud that there will be a general's daughter in our class. It's true that there is a field-marshal's daughter in the Third, but he is retired. Father always says: Nobody makes any fuss over a retired officer.

October 22nd. We are so much excited that we've hardly any time to learn our lessons. At Christmas last year some one gave Hella's mother several of Geierstamm's novels. The other day one of them was lying on

the table, and when her mother was out Hella had a hurried look at it and read the title *The Power of Woman!!!* When her mother had finished it, she watched to see where it was put in the bookcase, and now we are reading it. It's simply wonderful! It keeps me awake all night; Signe whom he is so passionately fond of and who deceives him. We cried so much that we could not go on reading. And Gretchen, the girl, to whom her father is everything; I can understand so well that she is always anxious lest her father should marry that horrid Frau Elise, although she has a husband already. And when she dies, oh, it's so horrible and so beautiful that we read it over three times in succession. The other day my eyes were quite red from crying, and Aunt said I must be working too hard; for she thinks that Hella and I are studying literature together. Oh dear, lessons are an awful nuisance when one has *such* books to read.

October 24th. When I look at Father I always think of the novel *The Power of Woman*; of course leaving Signe out of account. Hella hopes she'll be able to get hold of some other book, but it's not so easy to do without her mother finding it out, for she often lends books to her friends. Then there would be an awful row. We certainly don't want to read *The Little Brother's Book*, the title does not attract us; but there's a novel called *The Comedy of Marriage*, it must be splendid; we *must* get that whatever happens.

October 26th. The Bruckners are going to keep on their flat, and Hella's grandmother will come and live there; only the Herr *General!!!* is going to C., and of course Hella's mother too. Lizzi will stay, for she is taking cooking lessons, since she is to be *married* in Mid-Lent.

October 31st. Hella's parents left to-day, she cried frightfully, for she did so want to go with them. Lizzi was quite unconcerned, for she is engaged already, and the Baron, her fiance, is coming at Christmas, either to Vienna or Cracow; he does not care which.

November 4th. Some of the girls in our class were furious in the German lesson to-day. One or two of the girls did not know the proper places for commas, and Prof. Fritsch hinted that we had learned nothing at all in previous years. We understood perfectly well that he was aiming at Frau Doktor M., whose German lessons were 10 times or rather 100 times better than Professor F.'s. And on this very matter of punctuation Frau Doktor M. took a tremendous lot of trouble and gave us lots of examples. Besides, whether one has a good style or not does not depend upon

whether one puts a *comma* in the right place. The two Ehrenfelds, who towards the end were awfully fond of Frau Doktor M., say that we, who were Frau Doktor M.'s favourites, ought to write a composition without a single comma, just to show him. That's a splendid idea, and Hella and I will do it like a shot if only the others can be trusted to do it too.

November 6th. This year all the classes *must* have at least two outings every month, even in winter. If that had been decided in the last school year, when Frau Doktor M. was still there, I should certainly have gone every time. But this year, when she has left, we can't enjoy it. Frau Doktor St. is awfully nice, but not like Frau Doktor M. Besides, we go somewhere with Father every Sunday, Hella comes with us, and Lizzi if she likes. As soon as the snow comes we are going to have tobogganing parties at Hainfeld or Lilienfeld.

December 3rd. Nearly a whole month has passed without my writing, but I must write to-day! There's been such a row in the German lesson!! We got back the compositions in which Hella and I, the 2 Ehrenfelds, Brauner, Edith Bergler, and Kuhnelt, had not put a single comma. Nothing would have been found out had not that idiot Brauner put in commas first and then scratched them out. We had agreed that if the Prof. noticed anything we would say we had meant to go through them together before the lesson, and to decide where to put in commas, but that we had had no time. Now the silly fool has given away the whole show. He is going to bring the matter before the staff meeting. But after all, it's simply *impossible* to give 6 girls out of 25 a bad conduct mark.

December 4th. The head mistress came to inspect the German lesson to-day. Afterwards she said that she expected us to make all the knowledge which Frau Doktor M. had instilled into us for 3 years, the firm foundation of our further development in the higher classes. In the English lesson she referred to the more restricted use of punctuation marks in English; and afterwards we 6 *sinners* were summoned to the office. The whole school knew about the trouble and was astonished at our courage, especially the lower classes; the Fifth and the Sixth were rather annoyed that we in the Fourth had dared to do it. The head gave us a terrible scolding, saying that it was an unexampled piece of impudence, and that we were not doing credit to Frau Doktor M. Then Hella said very modestly: "Frau Direktorin, will you please allow me to say a word in our defence?" Then she explained that Prof. Fritsch never missed a chance of casting a slur upon

Frau Doktor M., not in plain words of course, but so that we could not fail to understand it, and that was why we acted as we did. The head answered we must certainly be mistaken, that no member of the staff could ever speak against another in such a way we had simply misunderstood Prof Fritsch! But we know perfectly well how often the Nutling used to say in the Maths lesson: “Don’t you know *that*? Surely you *must* have been taught that.” The emphasis does it!!!!! The staff meeting is to-morrow, and we were told to do our best to make amends before the meeting. The 2 Ehrenfelds suggested that we should write the compositions over again, of course with all the commas, and should place them on his desk to-morrow morning before the German lesson; but all the rest of us were against this, for we saw plainly that the head had changed colour when Hella said what she did. We shall make the corrections and then we shall all begin new copybooks.

December 8th. It is 3 days now since the staff meeting, but not a word has been said yet about our affair, and in the German lesson yesterday the Prof. gave out the subject for the third piece of home work without saying anything in particular. I think he is afraid to. Hella has saved us all, for everyone else would have been afraid to say what she did, even I. Hella said: “My dear Rita, I’m not an officer’s daughter for nothing;” if *I* have not courage, who should have? The girls stare at us in the interval and whenever they meet us, though in the office the head said to us: “I do hope that this business will not be spread all over the school.” But Brauner has a sister in the Second and Edith Bergler’s sister is in the Fifth and through them all the classes have heard about it. I suppose nothing is going to be said to our parents or something would have happened already. Besides, to be on the safe side, I have already dropped a few hints at home. And since Dora, thank goodness, is no longer at the school, it is impossible that there can be much fuss. It was only at first that we were alarmed, but Hella was quite right when she said: “I’m sure nothing will happen to us, for *we are in the right*.”

December 15th. A meeting with Viktor!!! Dora and I had gone to do our Christmas shopping, and we came across him just as we had turned into Tuchlauben. Dora got fiery red, and both their *voices trembled*. He does look fine, with his black moustache and his flashing eyes! And the green facings on his tunic suit him splendidly. He cleared his throat quickly to cover his embarrassment, and walked with us as far as the Upper Market-

place; he has another six-months furlough because of throat trouble; so Dora can be quite easy in her mind in case she fancied that —— —— —— . When he said goodbye he kissed our hands, *mine as well as Dora's*, and smiled so sweetly, sadly and sweetly at the same time. Several times I wanted to turn the conversation upon him. But when Dora does not want a thing, you can do what you like and she won't budge; she's as obstinate as a mule! She's always been like that since she was quite a little girl, when she used to say: Dor not! That meant: Dora won't; little wretch! such a wilful little beast!

December 17th. Yesterday we had our first tobogganing party on the Anninger; it was glorious, we kept on tumbling into the snow; the snow lay fairly thick, especially up there, where hardly anyone comes. As we were going home such a ridiculous thing happened to Hella; she caught her foot on a snag and tore off the whole sole of a brand new shoe. She had to tie it on with a string, and even then she limped so badly that every one believed she had sprained her ankle tobogganing. Her grandmother was frightfully angry and said: "That comes of such *unladylike* amusements!" Aunt Dora was very much upset, for she had been with us, but Father said: Hella's grandmother is quite an old lady, and in her day people had very different views in this respect. I should say so, *in this respect*, Hella finds it out a dozen times a day, all the things she must not say and must not do, and all the things which are unsuitable for young girls! Her grandmother would like to keep her under a glass shade; but not a transparent one, for she must not be able to see out, and *no one* must be able to see *in*. (The last is the main point.)

December 20th. To-day was the last German lesson before Christmas, and not a word more has been said about our affair. Hella has proved splendidly right. Even Verbenowitsch, who curries favour with every member of the staff, has congratulated her, and so has Hammer, who is a newcomer and did not know Frau Doktor M. By the way, at 1 o'clock the other day we met Franke; she goes now to a school of dramatic art, and says that the whole tone of the place is utterly different, she is so glad to have done with the High School. She had heard of the affair with Prof. F. and she congratulated us upon our *strength of character*, especially Hella of course. She says that the matter is common talk in all the High Schools of Vienna, at least she heard of it from a girl at the High School for the Daughters of Civil Servants, a girl whose sister is at the School of

Dramatic Art. She is very happy there, but she is annoyed that such an institution should still be called a school; it's not a *school* in the least; we would be astonished to see how free they all are. She is very pretty and has even more figure than she used to have. She speaks very prettily too, but rather too loudly, so that everyone turned round to look at us. She hopes that she will be able to invite us to see her debut in *one year!!!* I should never be able to stand on a stage before a lot of strangers, I know I would never be able to get a word out.

December 21st. Hella is awfully unlucky. The day before yesterday she got such bad influenza and sore throat that she can't go to Cracow. She says she is born to ill luck; this is the second Christmas that has been spoiled, two years ago the appendicitis operation, and now this wretched influenza. She hopes her mother will come to Vienna, but if so her father will be left quite alone. And how on earth shall we get on, Christmas without Mother, the first Christmas without Mother. I simply don't dare to think of it, for if I did it would make me cry. Dora says too that it can't be a proper Christmas without Mother. I wonder what Father will say when he sees Mother's portrait. I do hope the frame will be ready to-morrow. Hella is especially unhappy because she is not able to see Lajos. Besides, she is madly in love at the same time with a lieutenant of dragoons whom we meet every day and who is a count, and he is madly in love with her. He knows that her father is a general, for when her father went to kiss the Emperor's hand he took Hella part of the way with him in the motor, and she was introduced to the lieutenant then. So now he salutes her when they meet. He is tremendously tall and looks fearfully aristocratic. But what annoys me with Hella is that she *invariably* denies it when she is in love with anyone. I always tell her, or if she notices anything I don't deny it. What's the sense of it between friends? for example, the year before last she was certainly in love with the young doctor in the hospital. And in September when we came back from Theben with that magnificent lieutenant in the flying corps, I made no secret of the fact that I was frantically in love with him. But she did not believe me, and said: That is not real love, when people don't see one another for months and flirt with others between whiles. That was aimed at Hero Siegfried. Goodness me, at him!! it's really too absurd.

December 22nd. I am so delighted, Frau Doktor M., at least she is Frau Professor Theyer now, has written to me. I had sent her Christmas good

wishes, and she sent a line to thank me, and at the same time she wished me a happy New Year, *she took the lead in this*; it was heavenly. I was frightfully annoyed because Dora said that she had done it only to save herself the trouble of writing again; I'm sure that's not true. Dora always says things like that simply to annoy me. But her sweet, her divine letter, I carry it about with me wherever I go, and *her* photograph too. She sent Hella only a card, naturally, for that was all Hella had sent her. I can quite well fancy Frau Doktor M. as a stepmother, that is, not quite well, but better than anyone else. She wrote so sweetly about Mother, saying that of course I should find this Christmas less happy than usual. She is certainly right there. We can none of us feel as if the day after to-morrow is to be Christmas Eve. The only thing that I really enjoy thinking of is the way Father will stare when he sees the portrait. But really in the first years after such a loss one ought not to keep Christmas, for on such days one feels one's sadness more than ever.

December 23rd. I have still a frightful lot to do for Christmas, but I must write to-day. There was a ring at the front door this morning at about half past 11. I thought it must be Hella come to fetch me, that she must be all right again, so I rushed out, tore the door open, prepared to greet Hella, and then I was simply kerblunxed, for there was a gentleman standing who asked most politely: Is anyone at home? I knew him in a moment, it was that Dr. Pruckmuller from Fieberbr. Meanwhile Dora had opened the drawing-room door, and now came the great proof of deceitfulness: She was *not in the least* surprised, but said: "Ah, Dr. Pruckmuller, I am so glad you have kept your word." So it was plain that he had promised her to come, and I am practically sure she knew he was coming *to-day*, for she was wearing her best black silk apron with the insertions, such as we only wear when visitors are expected. What a humbug she is! So I went into the drawing-room too. Then Aunt Dora came in and asked him to supper this evening. Then he went away. All the time he had not said a word to me, it seemed as if he had not even noticed that there was such a person as me in the world Not until he was actually leaving did he say: "Well; Fraulein, how are you?" "Oh well," said I, "I'm much as anyone can expect to be so soon after Mother's death." Dora got as red as fire, for she understood. I shall know how to treat him *if* he becomes my brother-in-law. But that may be a long way off; for he lives in Innsbruck, and Father is not likely to allow Dora to marry away to Innsbruck. At dinner I hardly said a word, I

was so enraged at this deceitfulness. But there is more to come. At 7, or whatever time it was, Dr. Pruckmuller turned up. Dora appeared in a white blouse with a black bow, and had remained in her room till the last minute so that I might not know what she was wearing. For I had believed she would wear her black dress with the insertions, and so I was wearing mine. Oh well, that did not matter. At supper he talked all the time to Dora, so I purposely talked to Oswald. Then he said that on March 1st he was going to be transferred to Vienna. Once more Dora was not in the least astonished, so *she must have known all about it!* But now I remember quite well that in October the postman handed me a letter for her with the Innsbruck postmark. So she was *corresponding with him openly the whole time*, less than 6 months after Mother's death. It really is too bad! But when I was chattering about the country, she kicked me under the table as a hint not to laugh so frightfully. And when my brother-in-law in spe, oh how it does make me laugh, two or three years ago, in Goisern I think it was, we used to call Dora Inspe, because she had said of Robert Warth and me: The bridal pair in spe! And now she is in the same position. When he went away in the evening I was trembling lest Father should invite him to the Christmas tree, but thank goodness when Father asked: "What are you doing with yourself to-morrow," he answered: "To-morrow I am spending the day with my sister's family, she is married to a captain out Wieden way." Thank goodness that came to nothing, for we are not at all in the mood for visitors, especially the first Christmas without Mother. And if she knew —— — I wish I knew what really happens to the soul. Of course I gave up believing in Heaven long ago; but the soul must go somewhere. There are so many riddles, and they make one so unhappy; in a newspaper feuilleton the other day I saw the title of a chapter: *The Riddle of Love*. But *this* riddle does not make people sad, as one can see by Dora. Anyhow, all girls, that is all elder sisters, seem alike in this respect. I remember what Hella told me about Lizzi's engagement. It is true, she had first made his acquaintance in London, not at home; but there was just the same deceitfulness. What on earth does it mean? Would it not be much more kindly and reasonable to tell your sister *everything*? Otherwise how can anyone expect one to be an ally. Oh well, *I* don't care, I'm not going to let my Christmas Eve be disturbed by a thing *like that*; if one can call it a *Christmas Eve* at all. On Boxing Day, when he is to spend the evening

here, I shall tell Hella that I want to come to her and her grandmother. After all, I am glad she has stayed in Vienna.

December 25th. Christmas Eve was *very* melancholy. We all three got Mother's picture, life size in beautiful green frames, for our rooms. Dora sobbed out loud, and so I cried too and went up to Father and put my arms around him. His eyes were quite wet; for he adored Mother. Only Oswald did not actually cry, but he kept on biting his lips. I was so glad that Dr. P. was not there, for it is horribly disagreeable to cry before strangers. We *both* got lovely white guipure blouses, not lace blouses, then Aunt gave me a splendid album for 500 postcards, and she also gave me an anthology which I had asked for. Brahms' Hungarian Dances, because Dora would not lend me hers last year because she said they were too difficult for me; as if *that* were any business of hers; surely my music mistress is a better judge; then some writing paper with my monogram, a new en-tout-cas with everything complete, and hair ribbons and other trifles. Father was awfully delighted with Mother's portrait; of course we had not known that he was getting us life-size portraits of Mother, and from the last photograph of the winter before last we had quite a small likeness painted by Herr Milanowitz, who is a painter, and who knew Mother very well — in colour of course. And we got a lovely rococo frame to close up; when it is open it looks as if Mother were looking out of the window. That was *my* idea, and Herr Milanowitz thought it *most original*. Dora considered it very awkward that he would not take any money for it, but it made it possible for us to get a much more elegant frame. After Christmas; for New Year, we are going to send Herr M. some of the best cigars, bought with *our own* money, I wanted to send them for Christmas, but we don't know anything about cigars, and we did not want to tell anyone because one can never know whether one won't be betrayed and you will be told it is unintentional; but that is not true, for when one betrays anything one has always secretly intended to do so; and then one says it was a slip of the tongue; but one really knows all the time. I can't write down all the extra things that Dora got, only one of them: At 7 o'clock just when Father was lighting the candles on the tree, a commissionaire brought some lovely roses with two sprays of mistletoe interwoven and beneath a nosegay of violets —— — of course from Dr. P. with a card, but she would not let anyone read that. All she said was: "Dr. P. sends everyone Christmas greetings; I believe he had really written: *Merry* Christmas," but Dora did

not dare to say *that*. Oh, and Hella gave me a bead bag, and I gave her a purse with the double eagle on it, for she wanted a purse that would have a military look. I never knew anyone with such an enthusiasm for the army as Hella; certainly I think officers look awfully smart; but surely it's going too far when she feels that other men practically don't exist. The others have to learn a lot, for example doctors, lawyers, mining engineers, not to speak of students at the College of Agriculture, for perhaps these last "hardly count" (that's the phrase Hella is always using); but all of them have to learn a great deal more than officers do; Hella never will admit that, and always begins to talk of the officers of the general staff; as if they *all* belonged to the general staff! We have often argued about it. Still, I do hope she will get an officer for her husband, of course one who is well enough off to marry, for otherwise it's no go; for Father says the Bruckners have no private means. It's true he always says that of us too, but I don't believe it; we are not so to say rich, but I fancy we should both of us have enough money for an officer to be able to marry us. Anyhow, Dora voluntarily renounces that possibility, *if* she is really going to marry Dr. P.

27th. Well, I went to Hella's yesterday and stayed till 9, and on Christmas Day she was here. I see that I wrote above that the Bs. were not well off; it seems to me to be very much the reverse. We always get a great many things and very nice ones at Christmas and on our birthdays and name days (of course Protestants don't have these last), but we don't give one another such splendid things as the Bs. do. Hella had been given a piece of rose-coloured silk for a dress to wear at the dancing class which must have cost at least 50 crowns, and a lace collar and cuffs, which we had seen at the shop, and it had cost 24 crowns, then she had a gold ring with an emerald, and a number of smaller things which she never even looked at. And to see all the things her sister got, things for her *trousseau!* And the Bs. Christmas tree cost 12 crowns whilst ours cost only 7, though ours was just as good. So I think that the Bs. really have plenty of money, and I said to Hella: "You must be enormously rich." And she said: "Oh well, not so rich as all that; I must not expect to marry an officer on the general staff. Lizzi has done very well for herself for Paul is a baron and is very well off. He is frantically in love with her; queer taste, isn't it?" I quite agree, for Lizzi has not much to boast of in the way of looks, beautiful fair hair, but she is so awfully thin, not a trace of b —— , Hella

has much more figure. And if one hasn't any by the time one is 20 one is not likely to get one.

Something awfully funny happened to-day. Hella asked me: "I say, what's the Christian name of that Dr. who is dangling after your sister?" Then it struck me for the first time that on his visiting card he only has Dr. jur. A. Pruckmuller, and then I remembered that last summer, when we first made his acquaintance, Dora said, It's a pity he's called August, the name does not suit him at all. Well, we laughed till we felt quite ill, for of course Hella began to sing: "O du lieber Augustin," and then I thought of Der dumme August [clown's nickname in circus] and we wondered what Dora would call him. Gusti or Gustel, or Augi, my darling Augi, my beloved Gusterl, oh dear, we were in fits of laughter. Then we discussed what names we should like to have for our husbands, and I said: Ewald or Leo, and Hella said: Wouldn't you like Siegfried? But I put my hand on her mouth and said: "Shut up, or you will make me really angry, *that* is and must remain forgotten." She said what she would like best would be to have a husband called Peter or Thamian or Chrysostomus; then for a pet name she would use Dami or Sosti; and then she said quite seriously that she would only marry a man called Egon, or Alexander, or at least Georg. Just at that moment her mother came in to call us to tea, and she said: "What's an that about Alexander and Georg? You are such dreadful girls. If you are alone together for a couple of minutes (I had come at half past 2 and the Brs. have tea at 4, and that's what Hella's mother calls 2 minutes), you begin to talk of unsuitable things." Hella was afraid her mother would think God knows what, so she said: "Oh no, Mother, we were only discussing what names we should like our fiances to have." You ought to have seen how her mother went on. "That's just it, that when you are barely 15 (I'm not 15 yet) you should have nothing but *such* things in your heads!" *Such* things, how absurd. At tea it was almost as dull as it was the other evening at home; for the Herr Baron was there, that is, they all say Du to one another now, for the wedding is to be in February, as soon as it is settled whether the Baron is to stay in London or to be transferred to Berlin. It must be funny to say "Du" to a strange man. Hella says she soon got used to it, and that she likes Paul well enough. When he brings Lizzi sweets, when he is taking her to the theatre, he always gives Hella a box for herself. *Other* people would certainly not do that, and I know *other* people who wouldn't accept it. When I got home, Father said: Well,

another time I think you'd better stay and sleep at the Brs., and I said: I did not want to be a killjoy here. And Oswald said: "What you need is a box on the ear," Father was luckily out of the room already and so I said: "*Your* children, if you ever have any, can be kept in order by boxing their ears till they are green and blue, but you have no rights over your sisters, Father told you so in Fieberbrunn." "Oh, I know Father always backs you two up, he has done so from the first." "Please don't draw me into your quarrels," said Dora, as if she had been something quite different from me. And then Aunt Dora said: "I do wish you would not keep on quarreling." "*I* didn't begin it," said I, and went away without saying goodnight; that is I went to Father's room to say goodnight to him and I saw Aunt Dora in the hall, but I *didn't* say goodnight to Oswald and Dora, for I'm not going to put up with *everything*. And now it's half past 11 already, for I have been writing such a long time, and have cried such a lot, for I'm *very* unhappy. Even Hella doesn't know how unhappy I am. I must go to bed now; whether I shall sleep or not is another question. If I can possibly manage it, I shall go alone to the cemetery to-morrow.

31st. Hella and I went to the cemetery to-day. Her father and mother returned to Cracow yesterday evening, and she told her grandmother she was going to spend the morning with me, and I said I was going to the Brs., so we went alone to Potzleinsdorf. Hella went for a walk round the cemetery while I went to darling Mother's grave. I am so unhappy; Hella consoles me as much as she can, but even she can't understand.

January 1, 19 — ! Of course we did not keep New Year's Eve yesterday, but were quite alone and it was very melancholy. This morning Dr. P. brought Dora and Aunt Dora some roses and he gave me some lovely violets as a New Year's greeting. He is leaving on the 4th, so he is coming here on the evening of the 3rd. I can't say I look forward to it. To-morrow school begins thank goodness. I met a dust cart, that means good luck; Father says it is a scandal the way the dirt carts go on all through the day in Vienna, and that one should see one even on New Year's day at 2 in the afternoon. But still, if it means *good luck!*

January 2nd. The dust cart did bring good luck. We had a real piece of *luck* to-day! In the big interval I noticed a little knot of girls in the hall, and suddenly I felt as if my heart would stop beating. Frau Doktor M., I should say Frau Professor Theyer, was standing among them, she saw us directly and held out her hand to us so we kissed it. She has come to visit

her parents and *her husband* is with her; since she did not know for certain whether she would be able to come to the school she had not written either to me or to Hella about it. She is so lovely and so entrancingly loveable. When the bell rang for class and Frau Doktor Dunker came in I saw that *she* was still standing outside. So I put my handkerchief up to my face as if my nose were bleeding, and rushed out to her. And because I slipped and nearly fell, she held out her arms to me. Hardly had I reached her, when Hella came out and said: “Of course I understood directly; I said you were awfully bad, so I must go and look after you.” Then the Frau Professor laughed like anything and said: “You are such wicked little actresses; I must send you back immediately.” But of course she did not but was frightfully sweet. Then we begged her to let us stay with her, but she said: “No, no, I’ve been your teacher here, and I must not encourage you in mischief. But here is a better idea. Would you like to come and see me to-morrow?” “Rather,” we both exclaimed. She said she was staying in a hotel, but we must not come alone to a hotel, so she would see us at her parents, in Schwindgasse, and we were to come there at 4 or half past. Then we kissed both her hands and were so happy! To-morrow at 4! Oh dear, a whole night more and nearly a whole day to wait. “If your parents allow you,” she said; as if Father or even Hella’s grandmother would not allow *that!* All Father said was: “All right Gretel, but don’t go quite off your head first or you won’t be able to find your way to Schwindgasse. Is Hella as crazy as you are?” Of course, how can one be otherwise?

January 3rd. Still 2 hours, it’s awful, Hella is coming to fetch me at half past 3. In school to-day we kept on looking at one another, and all the other girls thought it must be something to do with a man. Goodness, what do we care about a man now! We had a splendid idea, that we had just time to make a memento for *her*, since she does not leave until the evening of the 5th. I am having traced on a piece of yellow silk for a book marker an edelweiss and her monogram E. T., the new one of course. Hella is painting a paperknife in imitation of tarsia mosaic. I would rather have done something of that sort too, but I have no patience for such work, so I often spoil it before I’ve finished. But one can’t very well spoil a piece of embroidery. But I shan’t get the tracing on the silk back from the shop until half past 3, so I shall have to work all night and the whole day to-morrow.

Evening. Thank goodness and confound it, whichever way you like to take it, the idiot at the shop had forgotten about the bookmarker and I shan't get it until to-morrow morning early. So I'm able to write now: It was heavenly! We had to walk up and down in front of her house for at least half an hour, until at last it was 5 minutes past 4. She was so sweet to us! She wanted to say Sie to us, but we *simply would not have it*, and so she said Du as she used to. We talked of all sorts of things, I don't know what, only that I suddenly burst out crying, and then she drew me to her b —— , no, I can't write that about her; she drew me to herself and than I felt *her heart beating!* and went almost crazy. Hella says that I put both my arms round her neck, but I'm sure that's all imagination, for I should never have dared. She has such fascinating hands, and the *wedding ring* glistens so on her divine ring finger. Of course we talked about the school, and then she suddenly said: Tell me what really happened about those compositions, when half the class deliberately refrained from putting any punctuation marks. "Oh," we said, "that is a frightful cram, it wasn't *half* the class, but only 6 of us who have a special veneration for you." Then we told her how it all came about. She laughed a little, and said: "Well, girls, you did not do me any particular *service*. It really was a great piece of impertinence." But I said: "Prof. Fritsch's remarks were 10 times more impertinent, for they related to another member of the staff, and what was worse to you." Then she said: "My darling girls, that often happens in life, that the absent are given a bad reputation, whether justly or unjustly; one is liable to that in every profession." Hella said that the head mistress was not like that or there would have been a frightful row, since the matter had become known in all the High Schools of Vienna. Then Frau Doktor M. said: "Yes, the Frau Direktorin is really a splendid woman." Then there came something glorious, or really 2 glorious things: (1). She gave us some magnificent sweets, better than I have ever eaten before. Hella agrees, and we are really connoisseurs in the matter of sweets. The second thing, even more glorious, was this: after we had been there some time, there was a knock at the door and in came *her* husband, the Herr Prof., and said: "How are you my treasure?" and to us: "Goodday, young *ladies*." Then she introduced us, saying: "Two of my best-loved pupils and my most faithful adherents." Then the Herr Prof. laughed a great deal and said: "That can't be said of all pupils." So I said quickly: "Oh yes, it can be said of Frau Doktor, the whole class would go through fire for her."

Then he went away, and she said: “Excuse me for a moment,” and we could hear quite plainly that *he kissed her* in the next room, and then she said as she came in again: “Oh well, be off with you, Karl, goodbye.” It’s a pity his name is Karl, it’s so prosaic, and he calls her Lise, and I expect when they are alone he calls her Lieschen, since he is a North German. I must go to bed, it’s half past 11 already. To be continued to-morrow. Sleep well, my sweet glorious ecstatic golden and only treasure! God, I am so happy.

January 6th. Thank goodness to-day is a holiday, and we can’t go tobogganing because Dora has a *chill!!!* I got the bookmarker on the 4th, worked at it all day and up till midnight, and yesterday I got up at half past 5, went on working the whole morning, and at 2 o’clock we took our mementoes to the house. Though we should have liked to give them to her ourselves, we didn’t, but only gave them to the maid. She said: Shall I show you in? but Hella said: “No, thank you, we don’t want to disturb Frau Theyer, and when I reproached her for this she said: Oh no, it was better not; you are quite upset anyhow, you know what *she* said: But my dear child, you will make yourself ill; you must not do that on *my* account!” Oh dear, I’m crying so that I can hardly write, but I *must* write, for there is still so much that’s glorious to put down, things that I must never, never forget, even if it should take me a week to write. The great thing is that I shall simply live upon this memory, and the only thing I want in life is that I may see *her* once more. Of course we took her some flowers on Friday, I lilies of the valley with violets and tuberoses, and Hella Christmas roses. She was delighted, and went directly to fetch 2 vases which her mother brought in. She is as small as Frau Richter, and her hair is grey, she is charming; but she is not in the least like Frau Doktor M. When we said goodbye she offered us still more sweets, but since we were both nearly crying already we did not want to take any more, but she wrapped them nearly all up for us, saying: “To console you in your sorrow.” From anyone else it might have sounded ironical, but from her it was simply lovely. There were 17 large sweets, and Hella gave me 9 of them and took only 8 for herself. I shall eat only one every day, so that they will last me 9 days. *Joy and sorrow combined!!* Hella is not so frightfully in love as I am, and yesterday she said, in joke of course: “It seems to me that your whole world is foundered; I must pull you out, or you’ll be drowned.” And then she asked me how I could have been so stupid as to use the word

honeymoon to *her*, although she hemmed to warn me. She said it really was utterly idiotic of me, and that the Frau Prof. blushed. I did not notice it myself, but when her *husband* came in, she certainly did flush up like anything. Hella and I talked of quite a lot of *other things of that sort*. I should so much have liked to ask her whether she has given up going to church, for I think the Herr Prof. really is a Jew, though he does not *look* like one. For lots of other men wear black beards. But I did not venture to ask, and Hella thinks it is a very good thing I did not, for one *does not talk about such things*. I wonder *whether she will have a baby*? Oh, it would be horrible. Of course she may have entered into a *marriage* contract, that would have been the best way. However, Hella thinks that the professor would not have agreed to anything of the kind. But surely if he was frantically in love with her . . .

January 1 5th. The girls in our class are frantically jealous. We did not say in so many words that we, alone among them all, had been invited to see her, but Hella had brought one of the sweets she had given us and in the interval she said: This must be eaten reverently, and she cut it in two to give me half. The Ehrenfelds thought it must have been given by some acquaintance made at the skating rink, and Trude said: “Doubly sweetened, by chocolate and love.” “Yes,” said I, “but not in the sense you imagine.” And since she said: “Oh, of course, I know all about that, but I don’t want to be indiscreet,” Hella said: “I may as well tell you that Frau Doktor M., or I should say the *married* Frau Prof. Theyer, gave us this sweet and a great many more on the day she had invited us to go and see her.” Then they were all utterly kerblunxed and said: “Great Scott, what luck, but you always were Frau Doktor M.’s favourites, especially Lainer. But Lainer always courted Frau Doktor M.”

January 17th. The whole school knows about our being invited to see her, the glorious one! I’ve just been reading it over, and I see that I have left a frightful lot out, especially about her father. When we were leaving, just outside the house door we burst out crying because as I opened the door I had said, For the last time! Just then an old gentleman came up and was about to go in, and when he saw that we were crying, though we were standing quite in the shadow, he came up to us and asked what was the matter. Then Hella said: “We have lost out best friend.” Then the old gentleman looked at us for a tremendously long time and said: “I say, do you happen to be the two ardent admirers of Frau Doktor Mallburg? She is

my daughter, you know. And then he said: But you really can't go through the streets bathed in tears like that. Come upstairs again with me and my daughter will console you." So we really did go upstairs again, and she was perfectly unique. Her father opened the door and called out: Lieserl, your admirers simply can't part from you, and I found them being washed out to sea in a river of tears. Then she came out wearing a *rose-coloured dressing-gown!!!* exquisite. And she led us into the room and said: "Girls, you must not look at me in this old rag, which is only fit to throw away." I should have liked to say: "Give it to *me* then." But of course I could not. And when we made our final goodbye, perhaps *for ever*, she kissed each of us *twice over* and said: Girls, I wish you all the happiness in the world!

January 18th. Hella invited me there to-day, to meet Lajos and Jeno. But I'm not going, for Jeno does not interest me in the very least. That was not a *real* love. I don't care for anyone in the whole world except her, my one and only! Even Hella can't understand that, in fact she thinks it *dotty*. Father wanted me to go to Hella's *to change the current of my thoughts*. Of course I hardly say a word about *her* to anyone, for no one understands me. But I never could have believed that Father would be just like anyone else. It's quite true that I'm getting thin. I'm so glad that we are not going tobogganing to-day because Dora has a chill, a *real* chill this time. So I am going to the church in Schwindgasse and shall walk up and down in front of *her* house; perhaps I shall meet her father or her mother. I wrote to her the day before yesterday.

January 24th. I am so happy. She wrote to me *by return!* This is the second letter I have had from her! At dinner to-day Father said: "Hullo, Gretel, why are you looking so happy to-day? I have not seen you with such a sunny face for a long time." So I answered in as few words as possible: "After dinner I will tell *you* why." For the others need not know anything about it. And when I told Father vaguely that Frau Prof. Th. had written to me, Father said: "Oh, is *that* what has pleased you so much. But I have something up my sleeve which will also please you. February 1st and 2nd are Sunday and Monday, you have 2 days free, and if you and Hella can get a day off from school on Saturday we might make an excursion to Mariazell. How does that strike you?" It would be glorious, if only Hella is allowed to come, for her grandmother imagines that the sore throat she had before Christmas was due to the tobogganing on the Anninger, where the sole was torn off her shoe! As if *we* could help that.

Still, by good luck she may have forgotten it; she is 63 already, and one forgets a lot when one is that age.

Evening. Hella may come; it will be splendid! Perhaps we shall try a little skiing. But really Hella is a horrid pig; she said: “All right, I’ll come, if you’ll promise not to be continually talking about Frau Professor Th. I’m very fond of her too, but you are simply crazy about her.” It’s really too bad, and I shall never mention *her* name to the others any more. I am looking forward so to the tobogganing at Mariazell. We’ve never made any such excursion in winter before. Hurrah, it will be glorious! Oh I do wish the 31st of January were here; I’m frantically excited.

EDITOR’S NOTE

Rita’s joyful expectations of tobogganing among glistening snow-clad hills, remained unfulfilled. The rude hand of fate was thrust into the lives of the two sisters. On January 29th their father, suddenly struck down with paralysis, was brought home in an ambulance, and died in a few hours without recovering consciousness.

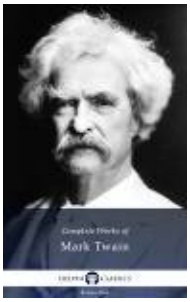
Torn from the sheltering and affectionate atmosphere of home, separated from her most intimate friend, the young orphan had to struggle for peace of soul in the isolation of a provincial town —

The Delphi Classics Catalogue

We are proud to present a listing of our complete catalogue of English titles, with new titles being added every month. Buying direct from our website means you can make great savings and take advantage of our instant Updates service. You can even purchase an entire series (Super Set) at a special discounted price.

Only from our website can readers purchase the special *Parts Edition* of our Complete Works titles. When you buy a Parts Edition, you will receive a folder of your chosen author's works, with each novel, play, poetry collection, non-fiction book and more divided into its own special volume. This allows you to read individual novels etc. and to know precisely where you are in an eBook. For more information, please visit our *Parts Edition* page.

Series Contents



Series One

Anton Chekhov
Charles Dickens
D.H. Lawrence
Dickensiana Volume I
Edgar Allan Poe
Elizabeth Gaskell
Fyodor Dostoyevsky
George Eliot
H. G. Wells

Sigmund Freud by Max Halberstadt, 1921

Golders Green Crematorium in North London — where Freud's ashes are held

Three days after his death Freud's body was cremated, with Harrods acting as funeral directors, on the instructions of his son, Ernst. Funeral orations were given by Ernest Jones and the Austrian author Stefan Zweig. Freud's ashes were later placed in the crematorium's Ernest George Columbarium.
